CALIFORNIA CULTIVATOR

and LIVESTOCK and DAIRY JOURNAL

Los Angeles — An Illustrated Weekly for the Rural Home and Ranch — San Francisco

Vol. LVII — July 2, 1921 — No. 1

In the Billion Class

ACCORDING to corrected figures of the bureau of the census California had on January 1, 1920, 117,690 farms. This varies but little from the figures given in the Cultivator of August 28, 1920, when the bureau released preliminary figures indicating the number as 117,993. The value of farm lands, with farm buildings, was $3,073,811,109, as against $1,450,601,488 in 1910.

In 1910 there were in this state 88,197 farms. There was not only increase in number of farms but in acreage, for the acreage on January 1, 1920, was 29,365,667; in 1910, 27,931,444.

Considering value of farm lands and buildings, California stands in the billion dollar class. We may remark that there are something over a score of states of the Union in this billion dollar class, and an even dozen with a valuation of over two billions. The topper of the whole list is Iowa, with $7,601,772,290. Little Rhoda stands at the foot of the class with a total valuation of $26,387,926.

California's percentage of increase is above that of most of the other states, though there was material increase in all valuations. The value of farm lands and buildings in the entire United States in 1920 was $67,795,965,384. That of 1910 was $34,801,125,697.

Average farm value for the United States in 1920 was $10,514, practically doubling the valuation in 1910, which was $5,471. California's average, however, was $26,122 as against $16,447 in 1910.

Average value of farm land per acre for the United States in 1920 was $70.94; that of 1910 was $39.60; in California, $104.67, more than doubling the average of 1910, which was $51.93. The highest average valuation is shown by Illinois, $231.93, with Iowa a close second with $227.09, that is, that ranking stands if the District of Columbia is not considered a state, for that rich little piece of land out of Maryland shows an average per acre valuation of $981.01. California ranks eighth in value of farm lands and buildings per acre of all the states in the Union.

*County boundaries changed since 1910.

The number of farms in the United States in 1920, according to the Fourteenth Census, was 6,448,366, as compared with 6,361,502 in 1910, showing an increase of 1.4 per cent. The total area of land in farms in 1920 was 955,676,545 acres, as against 878,798,325 acres in 1910, showing an increase of 8.7 per cent.

Value of Farms

The value of all farms in the United States on January 1, 1920 (value of land and buildings), was $67,795,965,384, as compared with $34,801,125,697 on April 15, 1910. The increase in the value of farms during the decade was $32,994,839,687, or 94.8 per cent. It thus appears that while there was only a slight increase in the number of farms between 1910 and 1920 and an increase of less than 10 per cent in the farm acreage, the value of farms nearly doubled.

Due allowance must be made, of course, for the fact that farm values in many localities were abnormally high at the beginning of the year 1920, and that present values might be considerably less than those reported at the time of the census.

Seven states reported values for farm land and buildings in excess of $3,000,000,000, as follows: Iowa, $7,601,772,290; Illinois, $7,416,583,951; Nebraska, $3,723,536,255; Texas, $3,717,799,544; Minnesota, $3,301,168,325; California, $3,073,811,109; and Missouri, $3,062,967,700.

Average Value per Farm

The average value of land and buildings per farm for the United States as a whole in 1920 was $10,514, as compared with $5,471 in 1910. —(Continued on Page 23.)

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Secretaries Hoover of the Interior and Wallace of Agriculture met with grain growers of the Middle West in Washington recently and discussed plans for improvement of warehousing of grains. There is nothing new in the plan they are suggesting; it is simply the nationalizing of a method which has been common in a few of the grain growing states. The proposal is to provide a method by which the farmer can be given unlimited storage facilities for his grain and receive a warehouse certificate in such form and under such conditions that it would pass as an order for delivery of the grain. It would thus greatly increase his borrowing power and relieve him of the pressure of selling his grain except at his own option. It would enable him to haul his grain at the time of the greatest farm economy without being compelled to sell at that time. It would extend his credit area far beyond his local bank.

* * *

Dispatches announce that "Wall Street has agreed to relieve some of the most serious phases of the domestic credit situation and will cooperate with the federal treasury by advancing $25,000,000 if Western bankers and associates will take care of another $25,000,000 for the creation of a $50,000,000 fund to be used in relieving the embarrassment under which farmers and livestock men are laboring. This offer comes, it is said, as the result of a resolution introduced into congress that the $50,000,000 be taken from the treasury. The $50,000,000 may be sufficient to aid in correcting the present situation, but it appears to us that it will take a much larger sum, and certainly more liberal treatment on the part of the market, to give very great encouragement to the livestock industry.

* * *

The Bankhead bill, H. R. 6048, is one of nearly a dozen bills before congress which provide for development of rural homes by a system of governmental cooperation in the reclamation of arid and semi-arid lands. These bills claim to retain some of the power and reclamation possibilities, especially of the Colorado River basin, for the use of all the people. There is a strenuous effort at this moment on the part of large hydro-electric corporations to gather in not only the power but the irrigation resources and make them subject entirely to private or, rather, big corporation control. It is a time for people of the Pacific Coast to keep their eyes open and prevent, if possible, the giving away of a great heritage.

* * *

Revision of freight rates to Australia and New Zealand will doubtless result in greatly increased trade with those countries. California's rice, barley, canned fruits and fish, as well as dried and fresh fruits, will doubtless meet with strong demand if they can be delivered at reasonable prices.

GREAT AGRICULTURAL FAIR

There are going to be some real fairs in California this year. We have never seen such early plans nor such early, aggressive action on the part of fair directors and managers. San Fernando Valley folks are no exception. A dozen or more chambers of commerce of the valley are in action and local pride is inspiring to best effort.

Hamilton Bassett will stage a great horse show as one feature of the fair. Mr. O'Neil, superintendent of tractors, trucks and farm power, will stage a great demonstration, also a still exhibit. Superintendent Hammond is making every effort to gather a great poultry exhibit and Mr. Adamson of Adohr Ranch is lining up the dairy classes.

OPPORTUNITY FOR SERVICE

Governor Stephens has signed the West bill creating a commission consisting of seven members to make a careful study of the entire problem of agricultural education in this and other states. During the last year there has been much said and printed to indicate that there exists considerable room for improvement in our present plan of agricultural instruction if California is to hold a front place among the leading colleges of America.

The Cultivator takes to itself reasonable satisfaction for having been the first periodical or paper in California to bring the need of a strong agricultural college before the people of this state. We assumed the responsibility in the face of considerable opposition and with little encouragement. From the first this paper endeavored to make plain that we had no axe to grind and that our motive ended in helping to secure the best college of agriculture in America for California. We believe that every investigation and development has justified the initiation of the movement.

CHIEF RESIGNS

George Livingston, chief of the bureau of markets, U. S. D. A., since the resignation of Charles J. Brand on July 1, 1919, has tendered his resignation to take effect July 1, 1921. In accepting his resignation Secretary Wallace said: "The government is, at least for the time being, unable to meet the competition of private enterprise in the matter of salaries and thus finds itself continually handicapped in carrying out its work in the most efficient manner. In view of all the circumstances and of your greater opportunities I am compelled to accept your resignation as chief of the bureau, but if you may find it possible to so arrange your affairs as to continue to assist the department for a few months at least, as a consulting specialist in marketing, I shall appreciate it."

A MILLION

The American Farm Bureau Federation has now passed the million mark and is adding at the rate of 50,000 new members per month. The 28 states affiliating in March 1920 have increased until now there are 43. The rate of increase in membership has been little less than marvelous. In March 1920 it was 456,000, by December of the same year it had nearly doubled, and on June 1, 1921 the exact count showed 1,052,114. Meantime an organ of large Eastern manufacturers is throwing forty fits because of the "terrible influence" which may be wielded by the "powerful and vicious lobby."

Well, for once the farmers are holding together and they may soon be classed with the powerful, and it is possible they may become real vicious. About the only excuse they offer for their use of the new found power is "Watch our smoke."

FOOL LAW

Referring to your editorial in Cultivator of June 18, headed "A Fool Law," I think your title for it is not strong enough. It is not only a "Fool Law" but a vicious one as well.

It is simply an entering wedge for a flood of just such class legislation. If lawyers can get a law compelling everybody to call a lawyer for any little bit of legal business he may be perfectly competent to do for himself, what is to hinder the carpenters, painters and plumbers from getting laws passed forbidding a man to build his own chicken coop, paint his barn or put a new washer on the kitchen faucet, but must get an expert, forsooth! for all these jobs? If this keeps up we shall soon be as bad as Germany with "Verboten" staring us in the face everywhere. The whole business is simply an outrage on free-born Americans.

If our friends the lawyers are losing their grasp on life so rapidly that they have to implore the legislature to pass laws to help them make a living, don't you think it is about time we stopped sending so many of them to the legislature?

Just what steps must be taken to invoke the operation of the referendum law that this sort of class legislation may be nipped in the bud?—D. W. Meeker, Escondido.

We appreciate our correspondent's spirit and interest in the referendum on this law, but so vigorous has been the protest that already nearly sufficient names have been signed to the referendum petition, and there is no doubt that the law will never become operative. However, anyone may aid in the campaign by dropping into the nearest bank or trust company and signing the petition. It was suggested that the Cultivator print blank form of petition for subscribers to sign and return, but it must be borne in mind that the signature must be made in the presence of the circulator of the petition, who must make affidavit that each name on the petition was signed in his presence.

WHY!

The San Francisco, or the Twelfth, Federal Reserve District Bank issues the best monthly report on agricultural and business conditions which we have yet received. The last number reviews conditions for the month of June and gives precedence, as it does also in its title, to agriculture. Bank clearances, milling, mining, lumbering, the petroleum industry, manufactures, and wholesale trade are all given attention, but California barley, livestock, wool, dairy products, canned fruits, farm prices and innumerable other agricultural items are discussed at length. Under transportation we note:

"Reduced rates by water from Pacific to Atlantic ports through the Panama Canal have stimulated wool shipments from points in Utah and Idaho by rail to Los Angeles and thence by water to the Atlantic seaboard. One hundred and fifty carloads have been dispatched at San Pedro since January 1, at a reported saving over railroad rates of $3 to $20 per ton."

A look at the map and then at "saving of $3 to $20 per ton" speaks volumes as to the failure of railroading. We certainly had it drilled into us during the war that the government was incompetent to handle a big transportation system and, unfortunately, some of those who had to do with the management of those railroads appeared to aid in the spreading of this propaganda. But conditions are so infinitely worse since the former management has taken back the handling of the railways that some of us, who were almost converted to the idea of the failure of government management, are now asking where may relief be had.

It is now in order to have the rates from Utah, Idaho and other mountain states to tidewater so advanced that this roundabout shipment at a saving of $20 per ton may not be possible to the producers.

Meantime railroads are calling attention to the fact that there is more produce being shipped this year than a year ago and endeavoring to show thereby that the producers are entirely satisfied with the high tariffs now prevailing. That there are greater shipments may be true, but it is also true that thousands of tons of lemons, onions, and other products have been dumped because of inability to get transportation costs when they are shipped. Products which would command sufficient to cover the transportation have gone forward because it was the only recourse for the producer. Livestock, which is eating its head off, and decaying onions are poor stuff to keep and must be shipped in order to prevent a greater loss.

Citrus Institute Meets

By Ernest Braunton

THE summer meeting of the California Citrus Institute was held in the high school at Whittier on June 24, and the next day the fourth annual fumigation and pest control school of the agricultural extension service of Los Angeles County was held in the same building. The attendance was good, the school auditorium being well filled throughout the two days.

The institute opened with Dr. J. T. Barrett, president, in the chair. After a few remarks of an introductory nature he presented M. J. Haig, secretary of the Whittier Chamber of Commerce, who, on behalf of the mayor and the city welcomed the delegates to Whittier, "the best place on earth." Dr. Barrett briefly responded and then outlined the aims and purposes of the institute, with a plea for widespread support in the way of membership. Then followed the forenoon's program with three unusually interesting and most practical talks on

Holding Production Costs Down

The first speaker was Geo. B. Hodgkin, of the industrial relations department, California Fruit Growers Exchange, who urged an increased efficiency rather than a reduction of wages. It has been found that when wages have been reduced efficiency has been decreased. If wages are reduced and efficiency corrspondingly reduced, a mistake has been made. The aim should be the highest possible efficiency. If this is attained the cost is of secondary importance for it is usually relatively less than where efficiency is at low ebb. Care of employes is the strongest factor in efficiency; even where wages have not been increased, better care has proven a splendid economic investment. Raise the standard of living, especially with

Picking Valencias in C. H. Beam Grove, Whittier

Mexican labor. This has proven profitable wherever tried.

Some employment medium is needed. At present there is no mutual interest between employment agency and farmer. The former furnishes a hand without regard to experience, fitness, where from or where going. The farmer receives a hand of whom he knows nothing and who may be nearly or entirely worthless for his line of work. Here is where the farm bureau should function. It would tend to stability of the labor market. It could aid in shifting labor from one district as work slackened to another where an increase was needed.

Dr. I. G. McBeth, manager of the Bastanchury Rancho, Fullerton, was the next speaker, on "Cost Per Acre and Per Box, or the Value of High Yields." He endorsed all the previous speaker had said about increased efficiency. He has found it is necessary to irrigate but every six weeks on much of the Bastanchury Rancho and in the heaviest soils but once in 60 days. This has materially lessened the cost of production for it cuts down, not alone irrigation expenses, but lessens the number of cultivations necessarily attendant on irrigations. He also heartily believes in the cooperative tractor unit movement now in practice in some sections. He incidentally stated the ranch used about 200 pounds of nitrogen per acre each year.

The pruning of lemons has been too severe. "We are now cutting away but one-fifth of the brush cut about four years ago, with a corresponding decrease in cost. Thin, but do not reduce, the size of tree." Keep up fumigation; do not slacken because the bottom drops out of the market for a year or two. If fumigation is not kept up production is reduced and cost of washing, handling, etc., is increased, possibly by 15 or 20 cents a box. Keep up production of crop so cost per box is kept down or you will have to get a higher price per box if a profit is to be returned.

The next speaker was Harry Damerel, of the J. M. Riley Fruit Company, Covina, who was given the subject, "Possible Economies in the Management of Citrus Orchards." He strongly advised the preparation and per-

(Continued on Page 6.)

Top-Working Australian Navel Trees

By A. D. Shamel

AN orange grower at Ojai, Ventura County, writes:

"I have several Navel trees that have degenerated into what I would call an Australian type. I wish to work these over into an improved Navel strain. What is generally regarded as the best practice for budding over old trees having a base diameter of from six to ten inches? It has been suggested that I bud the larger branches in the fall, also that I cut the tree back almost to the main forks and bud the shoots. I expect to have an expert do the budding. It has been our experience over a period of about 12 years with budding over these so-called Australians that after a few years of producing superior fruit they seem to gradually turn back into a tree that resembles closely the old tree in manner of growth, foliage and type of fruit. Of course this is not scientific, but many others to whom I have talked have had the same experience, and I feel sure that a few words on this subject will be of interest to many."

If the Navel orange trees are of the Australian type they can be worked over to an improved Navel strain with good results, providing proper care is taken to eliminate the adventitious growth of the Australian limbs until the growth from the improved Navel buds has become established. The writer's observations covering the top-working of several thousand of Australian strain trees of the Navel orange have led us to believe that the best results have been secured by budding directly into several of the main branches of the Australian tree. In most cases, it has been found advisable to thin down the bark where the buds are inserted so that it will not grow over inserted buds before the growth from these buds has started. The writer frequently cuts out a little notch in the bark where the bud is inserted and which fits over the eye of the bud, thus permitting the growth of the bud without restriction. The best results in the writer's experience have been secured by doing this work during the suring months and usually when the budding has been done during May. It is very important to have someone to do the budding who is experienced in this particular kind of top-working. It is the only safe way to undertake such a job.

With regard to the reverting of the top-worked Australian trees after a few years, will say that the writer is familiar with many instances where the Australian trees have been top-worked for ten years or more and are still producing superior fruit. In these cases care has been taken to keep out all adventitious growth from the Australian tree trunks or branches nearby or below where the buds were inserted. The writer believes that the so-called reversion is frequently nothing other than the development of growth from the Australian wood which, on account of its more vigorous habit of growth, eventually dominates the treetop. The writer has found several instances where this has been the case and he suspects that it frequently occurs where the top-working is not followed up carefully for several years. In one instance where a large number of Australian trees were top-worked eight years ago with bud wood secured from superior parent trees of the best Navel orange strain, the owner reported six years later that this top-working had proven to be a failure because many of the top-worked trees were producing Australian fruits and the growth from the improved buds had evidently reverted to the Australian type or the influence of the Australian trunk had been such as to develop coarse and typically Australian fruits. The writer and one of his associates made a careful investigation of these trees and found two interesting conditions; (1) in some cases the inserted buds had failed to grow on account of the bark growing over the buds, or they had died from other causes. Sprouts had developed from points on the Australian branches near where the buds had been inserted and this growth had been mistaken for the growth of the improved Navel buds. In these bases the treetops were made up of growth from the Australian limbs which was mistaken by those who cared for these trees and by the owner of them for the growth of the inserted buds; (2) another condition was where the improved buds had grown but in addition to the growth from the improved buds, sprouts from the cut off Australian branches had been allowed to develop which, on account of their strong growth, developed more rapidly than the growth from the improved buds. In these instances the fruits on these trees were largely borne by the Australian new growth and were typically Australian fruits, while the fruits borne by the growth from the improved buds were of fine quality in every respect. Enough time was taken by the writer and his associate to go into this matter fully and completely because the conditions were typical of those where most failures in top-working Navel orange trees have been ob-

Red Bluff, Tehama County, is planning to establish a free market where producers and consumers may do business directly.

Farmers Protective Association of Livermore, Alameda County, is discussing community slaughter house and refrigerator.

The Poultry Producers of Central California has packing and distributing plants at Petaluma, San Francisco, Oakland and Santa Cruz.

Home demonstration agent, Miss Clark, has been giving demonstrations of building and use of home evaporators at Redding and Corning.

President Denman of the Poultry Producers of Central California estimates sales made by the association this year will total $10,000,000.

Cherry growers of the Santa Clara Valley are asking assistance of the federal department of agriculture in solving problems of handling and shipping.

Officials of the California Cannery Association of Oakland met with the Farmers Union at Gridley to discuss means of bringing better prices to producers.

Rice growers of Sutter and Butte Counties recently held conference with the state reclamation board as to disposal of waste water from rice fields. Some drainage canals have been overfilled and serious damage caused.

President Stephens of the Pacific Rice Growers says that the average yield of rice per acre will be less than last year owing to poor quality of seed, and that, together with the reduced planting, will make this year's crop light.

"Sonoma County's Mountain Empire" centered around Annapolis in the northwestern corner of the county, recently picnicked and discussed its productivity, especially the proof which has been given that it is in the apple belt.

Central California

The annual rodeo at Salinas will be held July 27-31.

Sultana, Tulare County, is erecting a fig preserving factory.

The new sorghum factory at Modesto is nearly ready for operation.

Grain harvesting is in full swing with return more liberal than anticipated.

Tulare County farm bureau will hold a barbecue picnic at Mooney's Grove, July 4.

Fresno city is moving to secure better distribution of water, and perhaps better equipment.

The board of supervisors of Tulare County listened to arguments pro and con on squirrel destruction.

Kings County Fair Association is revising premium book for the fair to be held this fall at Hanford.

Tulare County poultrymen recently organized in Porterville with H. S. Williams of Poplar as president.

Commissioner Collins of Tulare County reports 19,500 acres set to grapes this season in that county.

The Corcoran district of Kings County is in the midst of grain harvesting season. The late rains materially increased the yield.

Representatives of local fruit and transportation companies met in Fresno last week to arrange shipping schedules for the 1921 fruit season.

San Joaquin Valley chambers of commerce have launched a movement for construction of a road connecting Grant and Sequoia national parks.

The Modesto and Turlock irrigation district people are discussing impounding water for power and irrigation along the Tuolumne and other rivers.

San Joaquin Valley towns are uniting in an advertising campaign through which it is hoped to give wide publicity to San Joaquin Valley's producing possibilities.

The farm center meeting at Ripon, San Joaquin County, was given to discussion of milk producers, J. M. Henderson, Jr., J. E. Thorp, Mr. Locke and others making addresses.

The California Associated Raisin Company is making survey of vineyards in Kings and Fresno Counties to determine extent of damage to grapes from excessive heat.

The Winton farm center of Merced Couny held an enthusiastic meeting, June 23, at which it was decided to establish a number of demonstration vineyards and orchards in that county.

According to the 1920 census, value of Fresno County farm lands and buildings is $279,861,191, as against $81,997,943 in 1910. This is greatest increase shown by any county in California.

Two concrete grain elevators were built in Stanislaus County this year to take care of present harvest. Grain is moving daily from both these elevators to the terminal elevator at Oakland.

Prof. J. W. Nelson of the state university has been making soil tests in Stanislaus County to determine moisture content. Many sections show serious condition through presence of too much water.

Southern California

The new freight rate on cantaloupes is $1.75 per hundred.

Orange County dairymen picnicked at Orange County Park last Saturday.

Prof. Bioletti gave grape culture demonstration at Coachella last Saturday.

California citrus growers met in semi-annual institute at Whittier last Friday.

Yucaipa Valley, San Bernardino County, reports marketing fine quality of cherries.

Orange County farm bureau is planning for grain elevators at El Toro and Capistrano.

Santa Ana canneries announce wage schedule for women and children same as last year.

The California Growers canneries will operate so far as possible during the coming season.

Ventura County apricot growers report 65,000 pounds of last season's 'cots in the holdover

The cannery at Banning has signed contracts with growers for 300 tons of peaches at $30 per ton.

Hemet, Riverside County, is making an effort to secure a greater portion of improved county roads.

The cannery at Arlington, Riverside County, announces that it will probably not open this season.

County Commissioner Sharp of Imperial reports roguing of cotton as deferred because of late season.

Coachella Valley cotton planters are practicing a much closer spacing system this season than formerly.

Imperial Valley pomelo growers are discussing advisability of forming cooperative marketing association.

Blythe, Riverside County, still maintains an organization of the Farmers Alliance. Tony Seeley is the secretary.

The cannery of the California Growers Association at Riverside announces that it will start on peaches about the middle of July.

Bruce Drummond, government date expert of Coachella Valley, announces that there will be exhibit of dates made at Riverside fair.

Coachella Valley interests have contracted with the department of agriculture to care for Saidy date shoots which are in quarantine.

The Milk Producers Association of San Diego County met recently and elected directors and officers. The president is James Ballantyne.

Ventura County is anticipating the early completion of a road over the mountains into Maricopa in the Kern County oil fields.

Bean growers are shipping and the market is receiving freely, and it is hoped the old crop will be out of the way before new Limas are harvested.

California Honey Producers Exchange reports its honey crop for 1920 totalled 844,000 pounds. This year's output will be little more than 30 per cent of that of last year.

One of Imperial Valley's finest melon fields this year was one of 400 acres grown and handled entirely by white labor. Japanese, however, control very largely in the general production.

The Coast and General

Hood River shipped its last car of apples May 19.

Western Oregon prune crop will average 50 per cent of normal.

Oregon Patrons of Husbandry recently met in annual convention at Eugene.

Mohair producers at Eddyville, Oregon, recently sold their entire pool at 22½ cents.

Douglas County, Oregon, claims to be the banner prune producing section of that state.

Many truck farms along the Columbia River have been materially damaged by overflow.

An international automobile, truck and tractor exposition is planned for the City of Mexico.

A 30 per cent injury resulted from heavy rains in the pepper producing section of Florida.

More than 200,000 pounds of Wasco County spinach was destroyed by high waters of the Columbia.

The United States imported 63,000,000 pounds of wool during the months of January and February.

The Institute of American Meat Packers has organized a committee on improved livestock breeding.

Yakima Valley potato acreage shows a material increase. The production will reach at least 12,000 acres.

Dairymen of Albany, Oregon, have just completed a new creamery to take the place of structure burned some weeks ago.

Tom Anderson of Chandler, Arizona, reports a yield of 17 sacks of wheat to the acre from 40 acres, or 2,380 pounds to the acre.

Georgia peaches coming into New York are declared lower in quality than usual. All fruit so far delivered has been small and green.

Georgia is declared to be the greatest watermelon producing state of the Union, some of the larger producing sections sending out as high as 1,000 cars.

The bridge over the Hassayampa at Wickenburg, Arizona, will be completed August 1, according to the announcement made by the state highway department yesterday.

The Arizona corporation commission has received nine applications for permits to operate stage line from Phoenix to Globe over the new Superior highway which will be opened this fall.

Plans are nearly complete for the extension of the electric power line from the Salt River Valley project in Arizona, which extends to Sacaton, to connect with the towns of Florence and Casa Grande.

Heavy showers over the northeastern section of Arizona have materially improved conditions on the range. Moderate showers have been reported in some other parts of the state, particularly in the northern section, but these were light and did little appreciable good.

The county farm bureau at Signal Creek school house of the Casa Grande Valley, Arizona, recently held a potato show. The first prize was won on the variety known as Flagstaff Reds. The farm bureau members have been getting together in an effort to improve types of vegetables, fruits, grains, etc.

Conditioning the Pullets

By Jean A. Koethen

AN item in a recent Cultivator entitled, 'To Postpone Laying' interests me greatly," writes a Santa Rosa subscriber. "I also have February pullets and do not want them to lay too soon. Is the bran and bone meal fed as a dry mash, and is the bone green? Will you also please explain how much cracked corn should be used and with what other grains, and what proportions of each grain."

The problem of the maturing pullet is a delicate one. We want our pullets to begin laying as early as they can without injury to the highly organized constitution which characterizes every high producer. We also wish to escape the fall molt, which, in the case of February and January pullets, is a more or less serious handicap, depending on weather, method of feed and some other considerations which I fear none of us clearly understand.

The average poultry keeper is delighted when the first of a bunch of pullets begins to lay. If it happens to be at four months of age he is loud in his advertising of those wonderful chickens, he increases the protein in their laying mash, keeps them stuffing the heaviest ration possible, and anticipates a year in which every pullet will lay her egg a day. Then what happens? The contrary creatures lay through July and August, possibly through September, then go into a molt which keeps them non-producers till the price begins to drop in January.

Maturity First

A February pullet of high fecundity cannot be kept from laying till October. She will probably lay in August in spite of all efforts to postpone laying. What she must not do is to lay before she is thoroughly matured.

Now maturity means two things. It means frame and muscle, but it also means fat. Professor Rice of Cornell in quite a long series of investigations discovered that the heavy winter producers always had considerable surplus of fat on their bodies and concluded therefore that some surplus fat is a sine qua non of steady production. Probably this is the reason hens of the American breeds lay more steadily in cold or wet weather than do Leghorns. Some fat is required for the manufacture of every egg yolk. In a long summer day the pullet gets enough fat from her daily ration to keep her body warm and provide the egg yolk. In the short, chilly days of fall and early winter she cannot eat enough for both purposes and is obliged to draw from the store of surplus fat on her body. When this is exhausted she quits and goes into a fall molt. If she can be held back from laying till October, or if she can be provided with a good deal of surplus fat before she begins, she may be kept laying right through the fall and winter. I say "may" because there are cases in which the greatest care and most scientific management have not prevented a fall molt though they have perhaps kept production going in spite of the molt. The hen is a temperamental creature at the best and we can only build on a scientific foundation and trust she will fall in with our ideas.

The Maintenance Ration

The holding back method advocated by the poultry division of our own agricultural college consists simply in removing the laying mash as soon as the first eggs are seen and giving instead a mixture of 95 per cent bran and 5 per cent bone meal, the theory being that a pullet cannot lay if she has not the proper materials for making eggs, and she must therefore use her food for building frame and putting fat on it. I have never heard Professor Dougherty mention the "surplus fat" question. Probably he holds that a pullet given such a light mash will inevitably eat more grain and inevitably put on fat.

The Conditioning Mash

Cornele G. Ross of Pomona is so thoroughly satisfied of the need of conditioning pullets before they are allowed to lay that he has worked out a system of his own for the feeding of his pullets from the end of the first month to maturity, and I am very glad to be able to publish it.

From the fourth or fifth week till the first egg is dropped, the following "growing" mash is used: Wheat bran, 880 pounds; low grade flour, 140 pounds; corn meal, 200 pounds; ground milo, 100 pounds; ground wheat, 100 pounds; ground oat groats, 100 pounds; high grade meat scraps, 75 pounds; ground green bone, 75 pounds; charcoal, 35 pounds; salt, 10 pounds.

When the very first egg is dropped by a bunch of four or five hundred pullets (which is usually at about four months with Leghorns) they are shifted into laying quarters and given a conditioning mash for a month or six weeks or as long as they can be kept from laying to any extent. This conditioning mash consists of: Wheat bran, 640 pounds; low grade flour, 200 pounds; ground wheat, 200 pounds; corn meal, 300 pounds; ground milo, 200 pounds; high grade meat scrap, 50 pounds; ground green bone, 75 pounds; charcoal, 75 pounds; salt, 10 pounds.

A study of these two formulas reveals that he has cut down on the bran and beef scrap, which are high protein feeds, and increased the amount of corn meal and milo, which are both fattening.

As soon as the pullets indicate that they are bound to lay, no matter what ration is given, they are put on a regular commercial laying mash and allowed to go to it, but by this time there is surplus fat on their bodies and they are ready to lay full sized eggs and to lay them right along.

Cracked Corn

Neither Mr. Ross nor Professor Dougherty mentions cracked corn as a conditioning feed. For that suggestion I am indebted to an article by Victor G. Aubrey in a Country Gentleman of nearly two years ago. Mr. Aubrey there calls attention to the pre-maturity molt, which he says "occurs more or less with all pullets just at a time when they are beginning to develop the yolks in the yolk cluster and just at the time you notice the reddening up of the face and the starting or budding of the comb."

"Now, the thing to be done," he says, "at the time of this pre-maturity molt is just the reverse of what often

(Contnued on Page 21.)

The Vegetable Garden for July

Northern California

By A. R. Gould

THERE is still room for activity in the vegetable garden, and to keep the home table well supplied it is essential that you keep busy sowing seed and planting up the vacant plots. Soil conditions must be considered and some plots will need lime and manure. Never allow any crops to suffer for want of water, as it will prove fatal to such as lettuce, radish, onions, celery, etc. They will quickly run to seed. Open up the irrigation trenches and cultivate the day after watering, keeping the soil fine and forming a dust mulch. This means success.

Turnips and Kohl Rabi

Sow White Egg variety in rows very thinly in good rich soil. It matures very early. Yellow Globe is also a fine keeper and should be sown now for winter use. The kohl rabi is somewhat like a turnip and the top leaves may also be used. Should be sown now.

Beans

Make successional sowings of Golden Wax, Stringless Green Pod and Refugee in rows two feet apart. Those sown last month will need attention in the way of thinning out where the plants have come up closer than one inch apart. They need this room for development and a better crop will be the result. Tall or pole varieties will need the stakes for support.

Corn

For a late supply sow Country Gentleman, Golden Bantam and Alameda Sugar. Keep the wheel cultivator or hoe busy every week or so between the rows.

Peppers

Secure strong plants of these of the Bullnose or Chili.

Lettuce

Sow Big Boston and May Queen for a late supply. Sow the seeds very thinly and in fairly moist soil.

Leeks and Celery

There is still chance to plant these in the trenches which should have been previously prepared with manure. Both make a splendid winter vegetable.

Carrots

Thin out to six inches apart those sown last month and keep well watered.

Kale and Brussels Sprouts

Both excellent to grow for table use and the first named is fine for poultry. Best varieties, Tall Green Kale and Dwarf Perfection. Sow seeds on a warm but shaded border.

Cauliflower

These, if sown last month, should soon be ready for transplanting to other beds and later this month may be planted out in the plots, which should have been richly manured.

Tomatoes

Keep those being trained, tied in, and remove all axil shoots. Remove all diseased fruits as soon as they appear.

Spinach

Sow Round Summer and the Prickly variety in fairly rich soil in rows 18 to 20 inches apart.

Southern California

By D. F. Reichard

WE have passed through a most favorable spring for our garden work, but beware of the hot weather that will be upon us, or no doubt has been before this paper gets to you. Watch your plants closely that they do not get dry or stunted from lack of moisture.

Cucumbers do best when they can be irrigated once a week. Corn, even though it has wilted somewhat, will come through with a good crop if given a couple of good wettings between the time the tassels are out and the silks appear. Tomatoes, eggplants and peppers, if not planted too close, will need irrigating but twice a month. The suggestions on these few items will suffice to give you ideas for other stuff in your garden. When irrigating or wetting your stuff do not be content with standing a few minutes with a sprinkler and wet only the surface. Rather make good sized basins around each plant or furrow out between rows and allow water to run long enough to thoroughly soak your ground.

Where stuff has come to maturity see that it is harvested and used while it is in its prime, before the vegetables get tough, woody, pithy or stringy.

Do not desert your garden now because the weather is getting hot. Fall and winter vegetables are the most relished and if grown for market bring best prices. Keep stuff not matured in good growing condition, and where crops have been taken out, irrigate and work up the ground preparatory for late crops. During early July cucumbers, melons and squash can be put in with full assurance of making good crops. Sweet corn put in this month will be ready for roasting ears during October. It is late for planting Kentucky Wonder beans, but bush varieties can be put in for fall string beans. It is also late for Lima beans as they are so slow to mature. The latter part of the month put in peas, either Yorkshire Hero or Senator, and Irish potatoes. Also get in small plantings of the hardier stuffs, beets, carrots, radishes, green onions, turnips and parsnips for early winter vegetables.

Keep diligently after any insect, fungi or pests that may be on your place. For aphids or plant lice and other sucking insects spray thoroughly with Black Leaf 40. Use rosin spray for scale and dry arsenate of lead either as spray or in the dry form applied to the plants for chewing insects. Bordeaux mixture is the best fungicide at this time of the year. Gophers

(Continued on Page 8.)

CITRUS INSTITUTE MEETS

(Continued from Page 3.)

petuation of the orchard's history and the keeping of tree performance records. Make and keep orchard charts, but in your own way. If you understand it that is sufficient, others need not. Think of individual trees, not of orchards. Be optimistic; do not neglect orchards in "lean" years, but keep groves up for they are hard to recall when once run down.

Growers should practice cooperative tractor work and cooperative fumigation. Pay higher wages if you can get better service. Likewise, the most economical fertilizer is the one that brings the best results, no matter what it costs. Do not put on heavy doses of nitrogen when they may be washed away or leached down below root zone by rains or in some soils at any and all irrigations. Apply small doses more often. Prune as little as is possible but proper, and wax or paint the larger wounds. Look up the latest machinery; a new machine is just being put out that is a great improvement in making the six furrow irrigation ditches. Take your men, especially the foremen, to see what is being done in other orchards of extent and high class, and take them often. It is time well spent.

Afternoon and Evening

The afternoon was given up largely to statistical information, of which we hope to give some "figgers" later. The first subject dealt with was: "Changes in Cost of Production of Citrus Fruits Since 1910," by F. O. Wallschlaeger, secretary California Citrus League. He was followed by C. C. Teague, Limoneira Company, Santa Paula, in a thorough, most comprehensive presentation of "Freight Rates and Their Relation to Fruit Production." A banquet was given at 6:30 p. m. at the Whittier Women's Club and the evening session was given over to an address by G. Harold Powell, general manager California Fruit Growers Exchange.

Pest Control School

This was the fourth annual fumigation and pest control school held under the auspices of the Los Angeles County farm bureau, President Robert H. Neely in the chair. He introduced Farm Adviser Hodgson who gave a brief history of the movement and said that these annual meets had been perpetuated by reason of the widespread interest shown as manifested by the increasing annual attendance.

H. J. Ryan, horticultural commissioner of Los Angeles County, was presented to speak on the announced subject of "Scale Conditions in Southern California." "It costs us from $750,000 to $1,000,000 annually for pest control. Black scale is the worst pest, but only one of many. Purple scale is everywhere in Southern California and at many points in Los Angeles County. It spreads but slowly. Red scale is well distributed in the county. Citricola is as far west as Azusa. Citrus mealy bug is mostly confined to Los Angeles County but is not serious and citrophilus is not bad. Yellow scale is still prevalent but nowhere serious or hard to control."

Last year 28,000 acres were fumigated for black scale, 5,128 acres were fumigated twice; 1,045 of the 28,000 acres were also given an early season spraying. Of 2,235 groves reported 75 per cent were satisfactorily controlled. About 27 per cent, or 294 groves, were satisfactorily treated with arsenical sprays, and several other sprays did good work. One curious, yet not unimportant fact is that of 116 groves fumigated last year and reported as in the A-1 class and again fumigated this year, but 42 are now in the same class. This is not necessarily laid to inefficiency of fumigation, but the difference may be due to hatch of scale alone. Despite this showing all of the groves of the county show a 75 per cent control as against 65 per cent last year. Several charts were exhibited to show the differences in loss or gain over last year, based on the month in which fumigated. These figures were so at variance, so "eccentric," that nothing of value could be deduced. They were shown merely as of interest, and were almost amusing.

Next came R. S. Woglum, field department California Fruit Growers Exchange, on the dual subject, "Improvement in Fumigation Practice for the 1921 Season"; and, "The Use of Pots Versus the Cyanofumer and Liquid Gas." He said that gas tight tents were the main improvements of the past year but as the subject would be fully covered by Prof. Quayle, he would not further consider it. The dissatisfaction with fumigation results for the last two years has led about 50 per cent of the growers in one district to declare that they would return to the cyanofumer or pot methods, but the speaker was emphatic, as was Prof. Quayle who followed him, that the unsatisfactory fumigation of the past two years was not traceable to the use of liquid gas but to other causes.

Late fumigaiton for citricola is not so good as earlier, but even here liquid has proven superior to solid cyanide. There is no question but warm weather is best for liquid gas, and when temperatures are low the pot or solid cyanide method will prove more effective. The unsatisfactory results in the Pomona district are no doubt due primarily to increased resistance of scale. The present method is good but better applicators have been needed and are now available, and with the use of these the speaker believes the results everywhere will be more satisfactory. But the fact remains that in coldest weather, and then only, is the cyanofumer better. Night inspection by owner or confidential agent was advised. The best time for control of citricola is July-September. Daylight fumigation in hot weather is undesirable. Also avoid heavy winds and heavy cover crops. The latter keep the tent off the ground so leaks occur and gas striking a heavy crop turns to liquid or even to ice.

The last speaker of the morning session was H. J. Quayle, of the citrus experiment station, Riverside, on "The Use of Gas Tight Covers." Prof. Quayle is a "bird" when it comes to telling a story that really illustrates. He said he could only give the results of late experiments as far as they have gone. It is a little too early in the season to report in full. "We will give you some more later. We are like the man who was chased by a ghost until he sank exhausted on the end of a log. The ghost sat down on the other end and said, 'Well, we've been going some.' And the man replied, 'Yes, and as soon as I get my breath we're going some more.'"

Prof. Quayle had at least 15 samples of tent cloth, duly labelled, which he passed out into the audience, to show the new material being used; also one of an old tent treated with a rubber dip to make it comparatively gas tight. Improvements in cloth are still going on but those last in use are very good. Asked about the reputed danger in removing these tents, because of gas remaining, he said the danger was little as they are using lighter doses and longer time, for the gas cannot now dissipate as with canvas tents. "We also are able to use lighter doses than formerly considered possible." On large trees under canvas tents the cost was 66 cents a tree with 83 per cent kill. Right beside them, under gas tight tents, the cost was 64 cents a tree with a 99.44 per cent kill. This cost has now been reduced to 48 cents a tree. It is too early to definitely determine results but "we know they are at least equal to those obtained under canvas tents at a much less cost." The dosage has been reduced from .50, or a half pound of liquid gas, to .20, or one-fifth pound. This explains decrease in cost. The range of temperature in these experiments was from 81 to 45 degrees, but at the lower temperature the kill was satisfactory. Some fumigators advise stopping at 50 degrees and a few at even 60. Woglum advises 50 degrees as the minimum.

The Afternoon

Three subjects were treated during the afternoon. The first was "Spray Injury to Citrus Trees," by Geo. P. Gray, of the state department of agriculture, Sacramento; and C. P. Wilson, of the research laboratory department, California Fruit Growers Exchange. The second was "Biological Control of Scale Pests," by H. S. Armitage, state department of agriculture laboratory, Whittier. This was followed by a spirited discussion on red spider control led by R. S. Woglum and H. J. Quayle.

TOP-WORKING AUSTRALIAN NAVEL TREES

(Continued from Page 3.)

served. As a result of these rather frequent observations of the causes for failure in top-working such trees, the writer has come to the conclusion that it is usually best to take out such trees and replant them, notwithstanding the many advantages of top-working when it is done and carried out under the best of conditions.

One other instance might be mentioned in this connection because it illustrates a less frequent but still, perhaps, an important cause of failure in this connection. A friend of the writer's several years ago decided to top-work a number of old Australian Navel orange trees in his orchard. He hired a budder who was a careful and conscientious man and what is ordinarily called an expert budder. The owner of the Australian trees asked the budder to secure his bud wood for top-working the Australian trees from some superior performance record trees in one of the writer's plats. The budder cut the bud wood from the trees which the writer showed him at a time when performance records were being secured from the remainder of the trees in this plat. During the bud cutting, the writer visited the budder to find how he was getting along with the work. He was greatly surprised to find the budder in a typical Australian tree in this plat cutting bud sticks for his work. The writer asked the budder the reason for this action and the budder replied that he was unable to get enough large bud sticks from the trees which the writer had pointed out to him and so had gone to the neighboring Australian tree in order to get an adequate supply of bud wood of the kind which he considered essential for top-working purposes. He was actually cutting bud wood from a typical—an extreme example—Australian Navel orange strain tree for top-working Australian trees. Owing to the belief amongst many budders that large bud wood is absolutely essential for top-working purposes, the writer is firmly convinced from the experience just related and other similar experiences that oftentimes the Australian trees are top-worked with bud wood secured from other Australian trees on account of the ease with which large bud wood is secured in such Australian trees.

This correspondent can secure reliable bud wood for top-working from the Fruit Growers Supply Company of the California Fruit Growers Exchange. This bud wood is taken from superior performance record trees which produce uniformly good fruits of the best Navel orange type. If the top-working is done with such bud wood, the trees should be examined two or tree times a year for four or five years, in order to make sure that all adventitious growth from the Australian wood is cut out and removed. This is the only way in which it is possible to make sure that the new growth on the top-worked trees is from the buds inserted and not from the sprouts which spring up freely around

Holt Gear Steel

Flawless steel of proper strength and hardness, of composition to comply with the exacting Holt specifications, is used in making the gears of the "Caterpillar" Tractor. Holt metallurgists pass upon the quality of the steel and inspectors carefully check each of the 15 operations in the making of the gear.

Spray Now---Delay Is Costly

From a large grower and packer we have received the following letter:—

"Replying to your inquiry regarding our experience with Citrospray will say that we welcome this opportunity of telling you of the splendid results we have had both in controlling the scale and cleaning up the fungus with which the trees were infested.

"The fruit from the trees sprayed with Citrospray was of excellent quality, and arrived in the eastern markets without decay, bringing the top prices for fruit from this district.

"We did not get all of our orchards sprayed last year, and we figure that on one orchard of 12 acres our loss this year will be at least $5,000.00 on account of not being able to spray it. We won't let this occur again, however.

"Wishing you continued success in your good work, we are, etc."

The name of the writer and further particulars may be obtained from

the cut-off branches of the Australian tree and frequently from dormant buds along the limbs of such heavily pruned trees.

Summarizing our experience:

It is possible and practical to top-work healthy Australian trees to the best strain of the Washington Navel orange.

Top-working should be done only with absolutely reliable bud wood from superior performance record trees. Such bud wood is now available through the Fruit Growers Supply Company of the California Fruit Growers Exchange.

Top-working should be done by an experienced budder in this type of work.

The top-worked trees must be looked after carefully for several seasons in order to remove all growth except that from the inserted buds.

The trunks and main limbs of the top-worked trees must be carefully protected during the top-working process in order to prevent injury to the bark from sunburn or other exposure. Furthermore, the growth from the inserted buds must be cared for intelligently in order to secure a satisfactory development of this growth for a permanent tree top.

If these conditions cannot be conformed to in every particular, it is probably a better plan to replant with a reliable young tree and not attempt to do this top-working which, without proper care and consideration for a number of years, is likely to be disappointing.

ASSOCIATION VS. PACKERS

E. M. COLEMAN in Sunsweet Standard, writing of the California Prune and Apricot Growers Association, says:

"Recently a suggestion has been made somewhat prominent that our association should cultivate a more friendly relation with the commercial packer. Assuming the proposal to come from one who is a sincere friend of our association, we are forced to conclude it is made because of a lack of a correct understanding of the real business relation of our association to the packers.

"It is so entirely unlike the usual relation of competing merchants, or that between the various packers.

"In the real sense the association is not a buyer, but a selling agency for its members.

"There is no possible competition between our association and the packers as buyers. Only as sellers do we compete. The first obligation of the association sales agent is to sell all the membership crop, and at a price to secure a profit to the producer. The packer is under no obligation as to quality or price. His interest favors a low price. That portion of the crop outside of our association is subject to the packer's pleasure as to price. It has no other channel through which to reach the consumer. When preessure of oversupply enables him to buy at his own price, he gladly takes the unfortunate grower's crop at a price below cost of production and with it can so break the market as to easily prevent the association selling at a profit.

"He has lost nothing, while compelling the association to take loss equal to all growers' profit above cost of production. The last crop has been a good illustration of these significant facts.

"When the price broke from that fixed by the association, the packer bought nothing until the outside grower in distress was ready to accept from the packer any price he saw fit to give. He then could take this fruit at half price and easily sell it to the undoing of the association's best work.

"Suppose you stretch your imagination to see two grocers in the same block, one doing business in just the usual way and the other with some unusual opportunity to periodically buy stock at half price. It would be but child's play for him to destroy all chance for the other merchant to make a living profit. Could those merchants be friendly competitors?

"All market disturbance works disaster to the association but aids the packer. His gain comes from all that defeats, disturbs and discredits the association with either its membership or its market.

"As well ask the sheep grower to maintain friendly cooperation with coyotes."

MODERN PROVERBS FOR FIG GROWERS

By Cal Myrna

Go to the Blastophaga, thou fig grower; consider her ways and be wise. For her ways bring prosperity and happiness to the man that trusteth in her.

Know thy soil, O fig grower; for in its depths are the elements of success and joy. Dig deep into mother earth's bosom and she will repay thee with bounteous crops.

A sweet fig maketh a glad eater; but a sour fig is the despair of the consumer. Bountiful crops profit nothing unless quality goes hand in hand.

He becometh poor that deals out culls to the packer; but the practice of quality maketh rich.

The study of your trees is the beginning of wisdom; but the slacker despises wisdom and instruction. Despise not the counsels of the experienced for in them ye may find the road to success. He that witholdeth food from the soil, the land shall curse him; but blessing shall be upon the head of him that fertilizes liberally.

A little sulphur is a legitimate thing; but an excess brings disaster.—Associated Grower.

REVIEW OF CROP CONDITIONS IN CALIFORNIA JUNE 1, 1921

The composite condition of all crops in California on June 1 was about 3.7 per cent below their 10-year average condition on that date and practically the same as on June 1, 1920. Fruit crops were all better in 1920 on June 1 than they are this year. Field crops are better this year than in 1920.

The condition of the various crops on June 1, expressed in percentage of their 10-year averages (not the normal) was as follows:

Hay	103.6	Olives	95.7
Pasture	103.6	Berries	91.4
Wheat	102.6	Peaches	90.1
Barley	101.3	Prunes	88.5
Cantaloupes	101.1	Walnuts	88.5
Lemons	100.0	Almonds	84.5
Oranges	100.0	Cotton	81.5
Sugar Beets	100.0	Beans	78.5
Alfalfa	98.9	Pears	76.3
Oats	97.6	Apples	70.7
		Apricots	64.3

Average of all June 1, 1921 ..... 96.3
Average of all June 1, 1920 ..... 96.4
Average of all June 1, 1919 ..... 105.0

KIRKMAN NURSERIES

Reliable Trees and Vines

For Commercial Orchard and Vineyard Planting

To avoid the possibility of serious shortage we grow nursery stock in several favorable localities.

Occasionally unlooked for losses occur in nursery production, making it advisable to eliminate entire blocks of trees or vines. We plan to safeguard our customers to the fullest extent.

More than five million trees and vines are in course of propagation in our several California plants.

"He profits most who serves best" is our understanding of our craftsmanship, and we offer our services to prospective planters. We have been at it 33 years in California.

VEGETABLE GARDEN FOR JULY IN SOUTHERN CALIFORNIA

(Continued from Page 5.)

and moles should be watched very closely. Take a walk around your garden each morning to see if there are any signs of either rodent. Trapping is the best method of eradication, but many people prefer poisoning, while considerable success is obtained by gassing. Moles are only caught by traps or by drowning out where it is possible to cover large areas at one time with water.

Southern Arizona

By M. E. Bemis

JULY in southern Arizona is the corn month. Few people in the irrigated valleys realize the potential value of Mexican June corn. This variety of corn, which was native in Mexico, is adaptable to all arid and semi-arid sections and succeeds in producing ears regardless of whether or not there is humidity in the air at the time of pollenization. Eastern varieties of corn do not become pollenized if the weather is extremely dry at the time when the silks begin to show. Consequently it is not safe to plant these varieties although occasionally they do splendidly. Mexican June corn has been improved, considerable work of this kind having been done by the Sacaton government experiment station. Corn may be planted in the vicinity of the Salt River Valley up to July 25.

Mexican June corn is splendid for roasting ears, is excellent as a grain crop and unexcelled at least in this part of the country for a silage crop. There are possibilities of improving this variety still further, and an enterprising farmer may find here a fertile field in the development of a strain of corn which will bring out all the good qualities and eliminate some of the objectionable features such as ears growing high on the stalk.

There are one or two varieties of Indian corn such as the Papago and Pima which make a quick growth and which, like the Mexican June corn, are sure croppers in a semi-arid country.

July is also the month for planting beans. The pink beans or frijoles should be planted the latter part of July. Pole beans may also be planted in July. Kentucky Wonder Wax may be planted in the early part of the month and Kentucky Wonder and White Seeded Kentucky Wonder the latter part of the month. Burpee's Bush Lima and the Large Lima may be planted in July.

There is plenty of time in July for the grain sorghums, cow peas and Sudan grass. Sudan grass at this season of the year makes a rapid growth and while it requires considerable water it will be well worth while as a quick means of producing forage. Sudan grass is good for chickens and a patch in the garden for clipping to furnish green feed for the poultry is excellent.

TEAGUE TREES

THE STANDARD FOR QUALITY

They Give Satisfaction Wherever Planted

CITRUS TREES

Grown from selected buds on sour orange root. They are the best that money can buy.

AVOCADOS

All of the recommended varieties budded on hardy Mexican Seedlings.

FEIJOAS

Grafted trees from the best large fruiting varieties.

The Ornamental Garden for July

Southern California

By Ernest Braunton

JULY is a trying month on plants, beasts, and mankind. The exuberant growth of spring has been checked, plants have the added season's growth to maintain and mature and the demands on water and food are great. For ornamental plants nitrogenous fertilizers are not so much needed as earlier, for luxuriant growth is about over and ripening and finishing is the order of the day. A soil, staw or leaf mulch should be maintained to conserve the moisture content of the soil as equably as possible.

July is not an ideal month for seed sowing, and close attention must be paid to soil moisture if seeds are to grow. For that reason prepare seed beds deeply and pulverize well so soil will hold much water and keep seeds moist and unbaked. Gardeners are sowing antirrhinum (snapdragon), Canterbury bells, centaurea (dusty miller, etc.), cosmos, lobelia, nasturtiums, pansy, portulaca and stock. Nurserymen are planting eucalyptus and cypress seeds and all tree and shrub seeds from Australia and South Africa. They must have the young plants for fall, winter and spring trade. The following are some of the plants now being set in permanent position: carnation, cosmos, coreopsis, candytuft, centaurea, daisy, foxglove, forget-me-not, gaillardia, marigold, petunia, phlox, salpiglossis, scabiosa and violet. Carnations and violets are not expected to yield flowers before the cool weather of November or December, but now is a good time to establish them and continually nourish them to make good flower producers for winter.

Not until now have the tops of daffodils, Spanish iris and dwarf gladiolus died or yellowed in the writer's garden, and these bulbs may be taken up and stored in a cool, dry place, preferably in damp sand, if available. As the sand dries slowly in such a place, so do the bulbs, assuring a natural maturity and conservation of strength for next spring's floral effort. The foliage on amaryllis is also maturing; pull off the yellow leaves, stir the soil well but shallowly and mulch with stable manure. Flower spikes will soon appear.

This is the season when many flowering plants are at their best, the strain is great; if wrong treatment is given death may result. One of these plants is pelargonium, or Lady Washington geranium. Sometimes they will turn yellow and die, when three days before they were ideal. It is a case of "in the midst of life we are in death." Do not give much water or fertilizer after they begin to bloom. All that should have been done before. The same treatment is necessary with many plants.

Begin now with fertilizing chrysanthemums, about twice a week with liquid manure or balanced commercial fertilizer. After three weeks or so stop for a couple of weeks and then resume feeding. Water heavily Keep this up until buds begin to show color. Then stop feeding but water heavily until the last good blossom is gone.

Northern California

By A. R. Gould

IT will be necessary this month to give very careful attention to all flowering subjects, both annuals and perennials. Hot days and strong winds will play havoc with them. Stake all tall plants and be safe. This refers to hollyhock, dahlia, campanula, Michaelmas daisy, chrysanthemum, scabiosa and delphinium. Then special attention should be given to watering and cultivating. Once a week will help keep them in good condition. The application of a little liquid manure will have a lasting effect and fine flowers will result. The bugs will also be busy and spraying should be resorted to immediately they are seen.

All vines should be kept in order and any new growth tied in, as these tender shoots soon suffer if neglected. Especially is this true of roses. Of course there will also be dead wood to remove, as this makes a climbing rose look very unsightly, and while on the subject of roses we would also consider it opportune to attack the fungoid pest, rose rust. Climatic conditions are a contributing cause and the weaker hybrid varieties seem to be mostly affected. The most effective way to destroy this is to remove infected branches and burn, also spray even to the roots with copper sulphate. Liquid sulphur may be used as a preventive and we would advise spraying even those bushes which appear free from disease. Mildew attacks may also be warded off by liquid sulphur. Such varieties as Ulrich Brunner, Paul Neyron, Frau K. Druschki, etc., may be cut to encourage late blooming.

Dahlias

These should now be making very active growth, and it will be a good plan to mulch them around the roots

The Standard Oil ZEROLENE For Motor Cars

FACTS *you should know*

Correct Lubrication—

1—lengthens the life of your engine.

2—conserves engine power.

3—gives high engine performance.

4—is the most important factor in the successful operation of truck or tractor.

Zerolene *is* Correct Lubrication.

Ask for a copy of the new Zerolene Correct Lubrication Chart. There's a grade of Zerolene for your type of engine.

A grade for each type of engine

STANDARD OIL COMPANY (California)

with manure, which will do much to hold the moisture for the coming hot days. As the buds develop, remove all but the large terminal bud if you would have large flowers. As the black fly or aphis becomes troublesome spray with nicotine. Seedling plants of the dahlia should now be ready for transplanting, and after a few weeks will be large enough to plant out in their flowering quarters. Some very interesting types are obtained from seed.

Lawns

These will need plenty of water and a tonic such as a dressing of sheep manure, dried blood, guano, etc., will help to keep a fine dark green color. All weeds should be removed before they start to seed, which they will soon do during the hot weather.

Seed Sowing

Seeds to sow for winter and spring flowering subjects are cineraria, primula, Sweet William. We advise sowing in boxes of fine soil well prepared and placed in a slightly shaded situation. Keep moist but not soaked if you desire success.

Bulb Selection

Some might think it rather early to make out a list but those first with the order get the best stock imported. Some of the best Darwin tulips, those with the long stems, are fine for cutting. Daffodils or narcissus we shall deal with next month.

Asters, Zinnias, Cosmos

Plant out these useful subjects. Secure healthy plants from your nurseryman in the best colors but see that the ground is first well manured.

Propagate from Cuttings

Rose, carnation, box privet and lonicera nitda in a bed prepared with sand. Shade from the sun and keep well watered.

DATE GROWERS ORGANIZE

The Valley Packing Association is a new organization, with headquarters at Coachella. It is a strictly cooperative organization, embodying the one man, one vote; non-profit; no capital stock, and other of the well established principles of all cooperative effort.

This organization is a member of the California Date Growers Cooperative Association and, because of the large acreage controlled by its members, expects to handle a pack the coming season of from 35 to 50 tons of dates, composed of practically all the standard varieties now grown in this country, as well as much of the best of the fruit of palms grown from seed.

At the present the membership will not be increased in the belief that the only way for successfully solving the many packing and marketing problems is through a compact organization which will proceed very slowly, establishing the success of each new step before planning others.

This organization embraces the owners of the following groves: Beach Date Garden, Thermal; Menakher Date Garden, Coachella; Nomad Date Garden, Indio; Russel Date Garden, Thermal; Tropical Date Co., Inc., Thermal, and has leased the house and property of the California Date Association at Coachella for a period of years. The acreage controlled is 81 of imported varieties and 15 of seedlings. The officers are: R. H. Postlethwaite, president; Geo. M. Beach, vice-president; B. K. Marvin, secretary.

PEAR MEALY-BUG CONTROL

A meeting of California pear growers was called by Director Hecke on June 9 in San Francisco for the discussion of ways and means to prevent the spread of the pear mealy-bug. This pest is causing considerable alarm to pear growers in Alameda County, where it has recently broken out in a few orchards adjacent to the drying yards. Its introduction has been traced to infested Sacramento River districts from which points lug boxes of pears have been shipped for canning and drying purposes. These same boxes when carried into the orchards of Alameda County distributed the bug.

Among those attending the meeting were State Entomologist Harry Smith; Frank Swett, president of the Pear Growers Association; Fred Seulberger, commissioner of Alameda County; Harry Ladd, commissioner of San Joaquin County; Commissioner Fred Brosius of Sacramento County; W. D. Butler, Napa County commissioner; Lee Strong of the plant quarantine service, and representatives of the drying and canning interests. No definite means of control was decided upon and it is hoped that action will be adopted soon to prevent further spread into clean areas of this pest.—A. P. M.

U. S. DEPARTMENT REPORTS FROM FLORIDA

Florida will produce an excess of 1,000,000 more boxes of oranges this year than last, according to estimates just compiled by the bureau of crop estimates, United States department of agriculture. During 1919-20, the final reports of transportation companies show that 7,000,000 boxes of oranges were produced in the state. Up to April 1 of this year, 7,100,000 boxes had been shipped, and the department statisticians say that this indicates a yield for the 1920-21 season of 8,300,000 boxes.

The grapefruit crop in Florida, however, will not be as large as it was last year, the report shows. During the season of 1919-20, the state produced 5,500,000 boxes of grapefruit as compared with the estimates for this year's crop of 5,000,000 boxes. The total citrus fruit crop of the state, including oranges and grapefruit, was 12,500,000 boxes last year as compared with the estimated production of 13,300,000 boxes this year.

The report shows that up to April 1 of this year only 16 per cent of the grapefruit remained to be shipped, as compared to 30 per cent for the same date last season, and that 14 per cent of the oranges remained to be shipped, as compared to 10 per cent for the same date last year. The total value of the orange and grapefruit crop this year is estimated at $19,450,000, as compared to $26,800,000 last year. Though over 1,000,000 boxes more of oranges will be produced this year than last, the total value of the crop is estimated at $12,450,000, as compared to $18,550,000 last year. The average price per box is $1.50, as compared to $2.65 last year. The value of the grapefruit crop is $7,000,000, as compared to $8,250,000 last year, the average price per box being $1.40; last year it was $1.50.

MARKET NEWS

Market gluts are one of the principal causes of loss in marketing farm products, especially those of a highly perishable nature, such as soft fruits and vegetables, which can not be held until conditions of supply and demand adjust themselves. Avoidance of these ruinous conditions is possible in large measure by more careful and widespread distribution, but all products are not marketed most advantageously by the same system, and the marketing plan varies somewhat in different areas from season to season.

With respect to fruits and vegetables, and more especially those of high perishability, perhaps no more effective work in broadening distribution has been accomplished than that of the Imperial Valley melon growers and shippers in cooperation with the bureau of markets, United States department of agriculture. The department opens a temporary office at Brawley at the beginning of the shipping season. By means of a large chart in the temporary office of the department shippers are able to know the daily distribution of each day's shipments and diversions.

This information, in conjunction with the telegraphic report compiled by the department's representatives in the East and telegraphed to its Brawley office, showing receipts, prices and conditions in from 20 to 25 of the major markets of the country, enables the shipper to have before him each day a complete picture of the market situation with respect to melons, and to distribute his shipments accordingly. There is no discrimination. Every shipper has full knowledge of the entire situaiton. The day has passed when one shipper has advantage over another by reason of more complete information.

Widespread and accurate distribution can not be accomplished without dependable information as to conditions of supply and demand. The Imperial Valley situation is unique and not comparable to every condition, but when it is noted that carlot shipments have increased from approximately 4,500 in 1915 moving to about 150 cities to approximately 8,500 cars in 1920 moving to 260 cities, it furnishes food for serious thought.

Commercial date growing in the Salt River Valley has taken on a new impetus in the formation of the Phoenix Date Company, which has planted a considerable acreage of a variety of dates which has proved to be successful in Arizona.

$13.95
NOW BUYS A STANDARD NON-SKID
30x3½

Ford and other light car owners can now buy a tire of recognized standing and quality at a price that Firestone knows is the greatest value ever offered to the motoring public.

Cords At New Low Prices

Firestone Cords also are offered at lower prices: 30x3½, $24.50; 32x4, $46.30; 34x4½, $54.90. Tire repair men, who judge values best, class the Firestone Cord as the sturdiest carcass made. Forty-seven high-grade car manufacturers now use it as original equipment.

THE LITTLE HOUSES

I love the little houses
  On a newly opened street,
Where rosy wives with a child or two,
  Their homing husbands greet.

Where toys are on the new front steps
  And a baby cart chokes the hall,
Where velocipedes are the only cars,
  And like birds the children call.

The little house is a house of hope
  And love and faith also.
There's a busy hum in it all day long,
  And the hours like moments go.

The stately house has all achieved,
  It is dull and weary, too,
But the little house is aglow with dreams
  That may, perchance, come true.
—Mary Alicia Owen in Twilight Hour.

ELSIE

By Margaret A. Condon

SOFT shadows that wait on the late California afternoon were creeping down from the mountains. At Oakglen Ranch Donald Marsh, the young owner, and Pedro, his Mexican helper, were hastening to complete their task of propping the limbs of a huge Satsuma plum tree. Heavily weighted under the abundance of fast ripening purple fruit, the great limbs had been drooping almost to the breaking point, as if in mute entreaty for help to carry their luscious burden.

His work finished, and whistling softly, Donald stood back and surveyed the tree.

"It's a peach, Pedro," he said in his pleasant voice. "Those limbs are as heavy as"—he paused for a simile and, with a smile that belied his serious words, went on,"as heavy as my heart."

Pedro grinned from habit, showing a vast expanse of gleaming white teeth that lighted up his swarthy countenance as a glint of sunshine breaks through a cloud but, always chary of his English, said no word. In fact, it was not quite clear to Pedro what "the boss" meant by a heavy heart.

But Donald knew and for all his cheerful demeanor his heart was heavy. His vision was of a girl with lips and cheeks glowing, hair brown and wavy, eyes large and gray but dimmed with tears. This was Elsie, his young wife, who last night had sobbed out her sorrows on his shoulder and expressed in no uncertain terms her desire that they give up the California ranch and make their home in the East.

Donald was a native of California, loving the soil and the hills that surrounded him; Elsie a dainty maiden from the frosty slopes of New England. Their romance began one year before when Elsie was visiting friends in California. Six months later Donald followed the girl to her Eastern home and returned with her as his wife. The aftermath brought clouds as well as sunshine. Elsie, while very much in love with her goodlooking young husband, sorely missed her relatives and all the environment of her nineteen years of life in the East. While she did her best to conquer homesickness there was apparent a lack of interest in their surroundings that grieved Donald deeply. Matters had reached a point now where in his goodness of heart and affection for his pretty wife he was greatly perplexed as to what the outcome would be.

Elsie met him cheerfully that evening when he entered the neat home but there was a wistful look in her gray eyes that Donald would have given years of his life to dispel.

"You ought to see that big Satsuma tree over in the barley field, Elsie," Donald remarked, as, the substantials of the evening meal disposed of, he helped Elsie and himself liberally to peaches and cream. "It's loaded to the breaking point with purple beauties. Pedro and I spent nearly two hours this afternoon putting supports under the limbs."

Elsie laughed, and her laughter sounded very welcome to Donald. She was interested in Pedro: he was a new type to her.

"Good old Pedro," she said. "I'll bet, Donald, if any ripe plums dropped off he picked them up and asked you if he could take them home for the ninos."

"That's just what he did do—always thinking of the ninos, and I like him the better for it," Donald said laughingly, then regretted his words as Elsie's eyes grew misty and he knew her thoughts had flown to her young brothers and sister far away beyond the mountains.

A little later the girl drew a low chair beside her husband and said coaxingly:

"Now, Donald, let's talk it over."

Donald shook his head. He well knew to what she referred and said teasingly:

"Talk it over if you must, Elsie, but I'd much rather you talked about the fruit crop or the mockingbirds that peck our figs or about "Teddy," and on hearing his name, a beautiful tan and white collie with silky hair and long drooping tail rose from his place on the porch, came over to Donald and laid a cold black muzzle against his knee.

Elsie looked distressed.

I wish you would be serious, Donald," she returned. "This means so much to me."

Still smiling, Donald patted Teddy's head.

"You know how I feel about it, Elsie," he replied. "You told me one day you believed that I had a speaking acquaintance with every blade of grass on the place. It's true, Dearie. I love every tree, every shrub and growing thing that draws life from my land. I know you miss your friends and your old home, but that will wear off. I don't want you to forget your people but I do want you to take an interest in our home and be happy here. Later on they can visit us or we will make a trip East, but I'm afraid not until next year, Elsie. We have each other, and that is something. Don't ask me to give up the ranch."

"But I gave up my home and came to a strange country for you, Donald," the girl returned, on the verge of tears.

"You don't want to stay in a stange country for me, do you, Elsie?" Donald asked whimsically. "And the cases are not parallel. I'm established here and familiar with the ways and methods of ranching. In the East I'd have to learn and start all over again. It would be uphill work and we'd miss many of the comforts we enjoy here. Would you like to go East and spend a few months, Elsie?" Donald asked suddenly, his eyes searching her face with a look of fear and longing in their clear depths.

"Without you, Donald? Go away across the continent and leave you here? No, indeed," was Elsie's reply.

Donald laughed happily.

"Unreasonable woman," he said. "I should have been broken hearted if you had said yes, Elsie, but what are we to do? How shall we solve the problem?"

"I'm not asking you to sell the ranch, Donald," she persisted. "Lease it for a year, and we'll go East."

"It would mean a financial loss, Elsie. Dearie, try to be content here. I know you do not love my California now, but it will come. The lure of the West will hold you and everything will look bright. Won't you try to be patient a little while longer, Elsie?"

The girl's eyes filled with tears.

"I'm always trying—for your sake, Donald," she returned, and Donald thought best to say no more at that time.

The dry California summer was passing on flying feet. The girl of the East saw with wonder that the mountain streams were silent; the great hills wore their brown robes unchangingly; wild vegetation had parched and curled, and dry leaves littered the trails. But the home in its foothill setting was cool and pleasant. Great trees guarded it; vines and roses shaded the porch, and the spacious lawn under Pedro's watchful care was of a green to gladden the eyes.

Donald was rejoicing that Elsie had not mentioned the dread subject for several days, and hope was glimmer-

The Cultivator Patterns

3308. Girls' Blouse Suit.—Cut in four sizes: 8, 10, 12 and 14 years. A 12 year size will require 4⅞ yards of 36 inch material. Price 10 cents.

3614-3174. Ladies' Costume.—Waist 3614 cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3174 cut in seven sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. Its width at the foot is 1¾ yard. To make the dress for a medium size as illustrated in large view will require six yards of figured material 40 inches wide, and 1¾ yards of plain material. Of one material 7⅞ yards will be required. Two separate patterns, 10 cents for each pattern.

3171. Child's Play Garment.—Cut in five sizes: 1, 2, 3, 4 and 5 years. A 4 year size will require 2⅜ yards of 36 inch material. Price 10 cents.

3615. Ladies' Undergarments.—Cut in four sizes: small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 3¼ yards of 36 inch material. Price 10 cents.

3621. Girls' Dress.—Cut in four sizes: 6, 8, 10 and 12 years. A 10 year size will require 3½ yards of 36 inch material. Price 10 cents.

3592. Misses' Dress.—Cut in three sizes: 16, 18 and 20 years. An 18 year size will require 5 yards of 40 inch material. The width of the skirt at the foot is 2 yards. Price 10 cents.

3613. Girls' Dress.—Cut in four sizes: 4, 6, 8 and 10 years. A 6 year size requires 1¾ yards of 36 inch material. Price 10 cents.

3280. Ladies' House Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 6¼ yards of 36 inch material. The skirt measures 1⅞ yards at its lower edge. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT
California Cultivator

ing in his heart that the fight might be won, when he came in one evening and found her sobbing over a letter from home.

"It's no use, Donald," she said, and he saw that her mood was petulant. "I can never learn to like your California, with its dust and its dryness, its glaring sunlight, and its"—she paused, as a further disparaging comparison did not come, then added:

"If you love me, Donald, you will give it up."

Donald's kind heart sank. This was a condition he had not anticipated when he brought Elsie to the ranch. He would not reproach her, but unconsciously a new and justifiable sternness crept into his voice as he said:

"All right, Elsie. I can't see you grieve yourself into illness. I'll see what can be done to dispose of the ranch."

What this would mean to Donald no one but himself could realize. He felt that a crisis had come in their lives. He could not sacrifice Elsie's health and happiness, and he must be the one to give up his cherished enterprise to accept an uncertain future.

(Continued next week.)

HOME MADE PRESERVES

By W. V. Cruess, Author of Home and Farm Food Preservation.

(Concluded.)

Raspberries

Use three-fourths pound of sugar per pound of berries. Proceed as directed for strawberry recipe No. 1.

Loganberries or Blackberries

One pound of sugar per pound of berries. Proceed as directed for strawberry recipe No. 1.

Currants

One pound of sugar per pound of fruit. Proceed as for strawberry recipes No. 1 and No. 2.

Peaches

Recipe No. 1—Whole peaches are often preserved. The fruit may be lye peeled (if of canning varieties such as Muir, Tuscan, Phillips, etc.) by immersing in a boiling lye solution of one-half pound of soda lye per gallon of water, immediately followed by thorough rinsing in cold water. Or the fruit may be halved, pitted and peeled as for canning. Firm ripe, not soft ripe, peaches should be used. To each pound of fruit add three-fourths pound of sugar and 2 pints of water. Cook down quickly until fruit is clear or to 55 to 60 degrees Balling or 218 to 220 degrees Farenheit. Seal hot in jars.

Recipe No. 2—Proceed as directed above for figs, but do not parboil fruit before placing it in the syrup. Peach preserves are very often made by this or a similar sweet peach pickle recipe.

Pears

Peel, halve and core as for canning. Tough varieties, such as Kieffer, should be parboiled in water until tender. Bartletts usually do not require this treatment. A syrup made similarly to that in Recipe No. 2 for figs gives better results than a plain syrup. In preparing the syrup use 3 pounds of sugar to 2 pints of water, 1 pint of vinegar and spices as directed for figs. Thinly sliced lemon rind (a few strips only) added to the syrup improves the flavor of the preserves. Add 3 pounds of the pears to this amount of syrup. Cook to heavy preserve, 55 degrees Balling or 218 degrees Fahrenheit, and allow to stand over night. Pack carefully in jars. Add the syrup to the fruit. Seal and sterilize in water heated to 180 degrees Fahrenheit (simmering) for 30 minutes as directed for strawberry preserves. Jars should be completely covered during sterilization. Time counted after water reaches 180 degrees Fahrenheit (simmering).

Kumquats

Wash thoroughly. Slit down side to prevent bursting Boil in water until tender. Cool in cold water and remove seeds. Drain on a colander. To each pound of fruit add one pound of sugar and one pint of water and cook until clear or until syrup boils at 220 degrees Fahrenheit. Allow fruit and syrup to stand over night to absorb syrup. Pack in jars. Add hot syrup and sterilize in jars at 180 degrees Fahrenheit for 30 minutes. Tangerines and small oranges may be treated similarly.

Watermelon Preserves

Remove outer peel and inner red flesh. Use white portion only. Cut into small cubes about ½ inch square or in strips about ½ inch thick. Boil in water until tender (about ten minutes). To each pound of melon add one pound of sugar, ½ pint of water, and the juice of half a lemon. Boil until preserves are clear or to 220 degrees Fahrenheit or 60 degrees Balling. Allow to stand over night. Pack and sterilize as directed for pears. Spiced watermelon preserves may be prepared from watermelon cubes or strips boiled until tender in water and then preserved in the special syrup recommended in Recipe No. 2 for figs.

Cherries

Pit the cherries, if this can be done conveniently, or puncture the unpitted fruit thoroughly with a fork. Cook until tender in water to cover. To each pint of this hot water drained from the cooked fruit add one pound of sugar. Add about 1¼ pints of this syrup to each pound of fruit and cook slowly to a preserve consistency. Allow to stand over night. Pack and sterilize as directed for pears. If the cherries become tough and shriveled it is an indication of insufficient preliminary cooking in water. If so desired, a harmless red food coloring obtainable from a grocery store may be added to the syrup to intensify the color of the fruit. It should be added to the syrup before cooking.

Apricots

Use firm ripe fruit. Pit. Add one pound sugar and ½ pint water to each pound of fruit. Cook to preserve consistency and cool overnight. Sterilize as directed for strawberries.

Quince Preserves

Peel, quarter or cut in cubes or strips. Cook in water until tender and proceed as directed for watermelon preserves. This fruit is liable to become toughened unless the preliminary cooking in water is given

HINTS FROM HOUSEKEEPERS

Honey Drop Cakes—Graham Bread

One cup honey, ½ cup sugar, ½ cup butter or substitute, ½ cup sour milk, 1 egg, ½ tablespoon soda, 4 cups sifted flour. Baked in gem pans or dropped on a large pan or baked in layer pans for layer cake.

Honey Apple Butter.—One gallon good cooking apples, 1 quart honey, 1 quart honey vinegar, 1 heaping teaspoon ground cinnamon. Cook several hours, stirring often to prevent burning. If the vinegar is very strong use part water.

Graham Bread—Take 1 pint sweet milk, ½ cup extracted honey, 1/3 cup sugar, salt to taste, 2½ cups graham flour. Stir all into batter; put in a greased vessel and steam for three hours, then put in the oven for a half hour. For a change I add a cup of raisins or nuts or ½ cup raisins and ½ cup currants and dried prunes or figs chopped fine, or part nuts and part fruit. If too sweet leave out part of the sugar. I cook it about 4 or 4½ hours when fruit or nuts are in and I double the recipe. I cook in a gallon vessel; set the vessel in a larger vessel of boiling water, put on stove or in fireless cooker. It isn't always necessary to put in oven unless it is steamed and placed in the steamer over hot water. Oven cooking improves it. The fruit or nut loaf is especially good cold for picnic lunch.

I have enjoyed the household department for several years, and often intended to answer some questions, but several times my recipes would be in before I could send my letter.—Mrs. G. P., Korbel.

Use for Old Jar Rubbers

Rubbers can be used several times by pouring parowax around them after the top of the jar is tight. To open put the top in hot water a few minutes. When too old to use on jars I save some and put three or four in small frying pan or vessel on stove with hot water to put the jar in while I am filling it.—Mrs. G. P. Korbel.

HOUSEHOLD QUERIES

Crisp Cucumber Pickles

Some time ago the Cultivator had directions for making crisp cucumber pickles without scalding the vinegar. I used it and we thought the pickles the best we ever tasted, but I have misplaced the recipe and can't remember just the proportions.—Subscriber, Hollywood.

Pack fresh crisp cucumbers in quart fruit jars. In each jar put 1 tablespoon salt, 1 tablespoon sugar, 1 tablespoon mustard or mustard and ginger mixed and fill jar with cold vinegar, diluted with water according to taste if vinegar is strong. I usually fill jars half or three-fourths full of vinegar and pour in water to completely fill. Put on rubbers, screw down tops and set away for three or four weeks before using. They will keep perfectly for two years—perhaps longer.

SAME ON BOTH SIDES

A woebegone looking traveler in a small Georgia town approached the ancient negro who operated the primitive ferry across the dinky stream, and accosted him with: "Uncle, I'm broke, and I got to get across the river. Will you trust me for it?"

"Fare's only three cents, boss."

"I know it, but I haven't got three cents."

Uncle Mose placidly resumed his pipe. "Boss," he decided, "ef you ain't got three cents you won't be no better off on dat side de ribber dan yo' is on dis."—Pittsburg Chronicle-Telegraph.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Extension on Note

A owned house and lot upon which he gave mortgage to B. Thereafter A sold the place to C who agreed to assume the mortgage. Just before the mortgage became due B and C agreed to an extension of one year. A was not notified of this extension. Thereafter D purchased the note from B, took an assignment thereof, which was recorded. He then notified C that he must pay. What are the rights of the parties in the case?—Subscriber, Los Angeles.

As B received no consideration for the extension of time it was a void contract, and neither B nor his assignee, D, was in anywise bound thereby. D is entitled to immediately foreclose the mortgage and if he should grant an extension, as a consideration for such grant he may set any terms he may wish. If C had desired to have a valid extension he should have had a contract in writing, executed for a consideration, such as his obligation to pay the note, if he was not theretofore bound in writing, or a monetary consideration. It would not have been necessary to place the agreement for extension on record as it would be valid between the parties and any assignees of parties.

Separate Property

I have property upon which there is a mortgage. I have married and now wish to arrange the matter so that I can sell the property without my wife's consent and in the case of the death of either the property will go to the survivor. How can this be arranged?—Subscriber, Kelseyville.

As the property was undoubtedly separate property standing in the man's name, he is entitled to sell this property without the signature of the wife. If he desires the whole of the property to go to the wife upon his decease, he should execute a will in her favor. If she should die the property would remain in his name.

Partition of Estate

Six heirs of real estate in different eastern states live in various portions of the country. One would like these properties sold and proceeds distributed. What action is necessary to effect the sale, and if court action is necessary to be brought, is it necessary to bring it where the property is located, or where? How long would it take to get results? Would the party starting action be required to pay costs or would they all be liable?—Subscriber, Riverside.

Action concerning real property must necessarily be taken in the location of the property. If all of the parties desire to effect such sale it can, of course, be accomplished without court action, but if there is objection, an action in partition will be necessary. The form and procedure of such actions vary in the different states. The length of time it would take depends largely upon the condition of the court calendars in the location of the courts in which the actions would be commenced, and, consequently, no statement can be made. Generally speaking, the costs, including the attorney's fees, are made a lien upon the property and divided in proportion to the interests of the parties involved. Generally speaking, any party interested can obtain the partition by judicial action.

Salmon Fishing

May salmon be caught by nets in the San Joaquin Valley?—Subscriber, Turlock.

In the San Joaquin Valley, except in the tide water of the San Francisco Bay, salmon cannot be caught other than by spear or by hook and line.

Immigrants

I have a family in a foreign country who wish to come here. How can I help them to enter the United States? —Subscriber, El Cajon.

The last immigration bill provides that immigrants from any particular country would be permitted to enter only to the extent of three per cent of those now in this country. It would be necessary, therefore, to write Commissioner of Immigration, Washington, D. C., to ascertain how these immigrants may be permitted to enter.

Bees a Nuisance

Some colonies of bees are located near my property line. They sting the horses when cultivating so that it is impossible for me to give proper culture to that portion of my land. What can be done? — Subscriber, Los Angeles.

In some counties there are ordinances regarding the keeping of bees, which the inquirer should look up. It would seem that under the circumstances you might have a right to an injunction to abate this particular nuisance.

Family Corporation

A family desires to incorporate a small family company for the purpose of handling the property acquired. Could there be a provision that stock should not be sold to outside parties or until the stockholders should have the first right of purchase? What are the advantages and disadvantages?—Subscriber, Live Oak.

A provision in respect to the sale of stock, giving to the other stockholders a right to purchase at par or some other fixed price within a certain time would be entirely valid and is frequently made. Incorporation itself is in some instances a very good plan. However, it entails greatly increased taxation, both federal and state. Other means could be adopted to attain the desired ends without such expense, as to which it would be well to consult your local attorney.

Water Rights

I have found a stream of water in the mountains near a homestead, which apparently runs to waste. How can I procure information as to this stream? Must a person place water to beneficial use in order to hold? Could it be placed to use for a homestead for which a patent has not been acquired? Must it be developed within a certain length of time?—Subscriber, Anaheim.

You could undoubtedly ascertain the facts concerning this stream either from the county recorder, who would have recorded appropriation notices, or from the state water commission. If you desire to place this stream to use it would be necessary to secure a permit from the state water commission, and this permit would provide a certain length of time which the commission would deem a reasonable time for the construction of, diversion and works. For good cause the time of permit may be extended from time to time, taking into consideration the size of the stream, difficulties of diversion and other matters pertaining to the particular work. The stream could undoubtedly be used for the development of the homestead unless there has been a prior appropriation. It must be placed to beneficial use to hold the right to take water.

Dont Send a Penny
Rubber Boots
For Ranchers and Irrigation Work
$3.98

A wonderful value in Hip or Knee Length Rubber Boots made of REAL gum Rubber with heavily reinforced seams. Made to order of the English Government for the British Army at actual COST OF MORE THAN WE ARE SELLING THEM FOR. Will stand all extremes of heat and cold and made to give extra long wear. Finest quality pure gum rubber with extra heavy soles. This is one of the very finest BARGAINS we have ever been able to offer our customers and the stock is limited so get your order in very early. Nothing better can be worn by ranchers or men who work in irrigated districts, rice fields, etc. This quality of Hip rubber boot would usually cost you $7.50 to $8.00. Remember you can get the full HIP boots for $3.98 or the shorter knee length boots for $3.29. Be sure to mark which kind you want on the coupon below. WE DO NOT WANT YOUR MONEY IN ADVANCE. We take all risk because these boots are such wonderful values. Fill out coupon NOW and mail at once if you want some of these boots before they are sold out.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Brown Scale

Am sending an apricot twig and would like to ask if there is any spray which can be used now for this scale. Is the scale one which may spread to peach, pear, apple and plum? We sprayed twice this spring with lime-sulphur and rosin spray.—Subscriber, Long Beach.

The twig sent showed a most serious infestation of brown apricot scale which can not be handled very successfully at this period of the year. If taken in hand when trees are dormant it may be eradicated or greatly reduced. This pest is rather liberal in its choice of a home and while perhaps more serious on the apricot than on other trees infests the orange, the date, peach, pear, plum and many of our ornamental plants. We would prefer to spray with the rosin or old time Martin wash in winter when trees are free of leaves.

Leaf Curl

Is there any spray that can be used now for leaf curl?—Subscriber, Long Beach.

The time to spray for leaf curl is in spring before blossoms are open. If trees are sprayed for blight in the fall then in spring spray with Bordeaux and there will be but little manifestation of the curl. Once the leaves have shown the curling there is no help whatever other than spraying with a weak Brodeaux which will possibly prevent new growth from becoming infected.

Codling Moth

Our apples, pears and peaches all had worms in the center of the fruit last year. Can this be avoided this year?—Subscriber, Long Beach.

Presumably this was codling moth, which may be controlled by spraying first in spring when tree is in full bloom and later at intervals of two to four weeks through the early growing season with neutral lead arsenate, three pounds to 50 gallons of water.

Twig Borer

Will you please tell me how to control a long, brown beetle about a quarter to a half inch long with blunt and rather large head in proportion to its body? It works into the branches of trees. It is attacking two eight year old olive trees, boring in about the length of the body and leaving the ends of the twigs to fall off. If the branch is a little larger than a lead pencil it is left in a weakened condition.—Subscriber, Maxwell.

There is no control of this pest which is economically possible.

Cucumber Blight

Please tell me why my cucumber seeds come up, then tiny plants turn brown and wither up.—Subscriber, Inglewood.

This trouble appears to be the result of adverse climatic influences. The unusually damp, cool weather experienced for the past few weeks has wrought well nigh universal destruction, in many districts, of cucumbers and melons of all sorts. Leading seedsmen report such complaints made every day as the helpless grower comes to buy more seeds. Doubtless nothing but sunshine will overcome this blight.

Tanning Rattlesnake Skins

Under "Questions and Answers" in the issue of June 18 you ask how to prepare a rattlesnake skin for a belt.

First select your belt, a smooth leather belt is the best. Take your belt with you and hunt up your snake and "kill it first," then skin it. By cutting through the skin from the tail to the head it will peel off readily. Put the skin on the belt green and let dry, and the belt is finished. The green skin will stick to leather as if it were glued on after it is once dry, and to remove it you will have to scape it off, if pains are taken when it is applied to the leather. A dry snake skin is useless as far as I know. —R. L. Snelling, Turlock.

* * *

Snake skins should, upon their removal, be fleshed, removing all surplus flesh and fat. After being well salted (common table salt) they should be laid in cool place for two or three days. Then take out salt and rinse in cool water, put into solution (in glass or earthen jar) made of one teaspoon each of alum, borax and saltpeter, rain water to cover skin, two or three days. Remove and hang by pinning each side of neck on wall, letting tail hang down in cool shady place out of all draft or breeze. When nearly dry place back (or scale side) long way on a smooth round pole with some smooth hard cloth next to pole, to prevent marring scales, rubbing flesh side with a smooth round surface until perfectly dry and soft. Never stretch or pull skin as scales will not stretch and they will be loosened by pulling the skin from them.—Jno. H. Baker, Ontaro.

(There are professionals who do this work and the Cultivator can supply address to those interested.—Edit.)

Useful and Ornamental Street Tree

There is a movement on foot here to plant ornamental trees along the highway. The power and telephone lines are in the way, which makes it necessary for us to put the trees back on our own land far enough to clear the lines. We would like to know whether there is any kind of fruit or nut tree that would be both useful and ornamental. Soil is saline, with 12 to 16 inches of fine sediment on top, sandy subsoil. Water is a foot from surface. Fig trees freeze back too often.—Subscriber, Thermal.

With water only a foot from the surface it would be difficult to find a tree that would stand such condition, but why not plant the tree which is supreme in the Coachella Valley, that is, the date, then trust the telephone line and highway regulations to raise that line so it will not interfere with trees. Certainly no telephone or power company has the right to usurp the highway to the exclusion of shade trees. It appeals to us that figs would not do well with subsoil conditions which are described. As a strictly ornamental tree which will stand the conditions of Coachella Valley this paper has referred heretofore to Tamarix articulata. Other ornamentals which will perhaps do well under those conditions are Casuarina, willow and cottonwood.

Wire Worms

Regarding article in the June 4 issue on page 746, "Wire Worms," signed Subscriber, Anaheim:

"Wire worms have positively been eradicated by the use of two sacks of Toro brand agricultural sulphur per acre, in both bean and melon fields. Potato scab has also been prevented by this soil application. It is beneficial to apply to the soil at the time of planting in order to have live sulphur around at the time of germination of the seed and growth. Sulphur applied to the soil in the fall will greatly increase the crops, but would likely not affect the wire worms in the summer time.—P. M. Paulson, San Francisco.

PAID BACK

She: It is complained of Shakespeare that he unnecessarily murdered Hamlet.

He: But he has been paid off for it. A great many Hamlets have murdered Shakespeare.—Foolscap.

To get more, a man must study and work more, to make himself worth more.

Harvest—and Your Fall Work

AS HARVEST approaches and passes, with the finishing-up of work on this year's crop in sight, another beginning looms up just ahead —fall plowing—and commands its share of attention, even in the crowded hours of harvest. Where crops grew this year there will be, in most cases, crops again next year. And in many places there will be crops on land that was unproductive this year.

Forward-looking farmers are thinking about this—planning just what land is to be plowed for next year's crop and what additional machinery will be needed in order to handle the work in a way that will bring the greatest profit return. Are *you* equipped to start the new beginning right? To carry through your fall work the way you'd like to do it?

Case Machines for Fall Work

Case Kerosene Tractors—10-18, 15-27 and 22-40 H. P.: *Grand Detour Power Plows*—2, 3, 4, 5 and 6-bottom sizes; *Grand Detour Disk Harrows*—6, 7, 8, 9 and 10-ft. sizes—will, as usual, play important parts in helping thousands of progressive farmers carry out their plans regarding next year's crops. These machines are built up to the high standards of an organization that has been building Case Threshers since 1842, Grand Detour Plows since 1837, Case Steam Engines since 1876 and gas tractors since 1892.

In the development and building of Case Machines and Grand Detour implements, the experience of the power-farming pioneer has been combined with the practical knowledge and down-to-earth common sense of the farmer, in such a way as to produce farm tools that do the work for which they are intended with the greatest degree of economy, ease and efficiency. That is the chief reason, we believe, why so many farmers prefer Case Tractors and Grand Detour Plows and Disk Harrows.

Write for our catalog and the name of the nearest Case dealer.

J. I. Case Threshing Machine Company

Dept. G-3 Racine, Wisconsin

NOTE: We want the public to know that our plows and harrows are NOT the Case plows and harrows made by the J. I. Case Plow Works Company

Livestock News Notes

A new world record for butter production was established June 15 when the Holstein cow, Bella Pontiac, owned by T. A. Barron of Brantford, Ontario, completed a year's test with 1,573.75 pounds of butter from 27,017 pounds of milk. The former record of 1,506.36 pounds of butter in 365 days was held by Duchess Skylark Ormsby and has stood since 1915.

Alex McDonald, who is in charge of the beef cattle herds at the university farm, Davis, has accepted an invitation to judge the Shorthorn classes at the Oregon state fair.

O. L. Raper of Glenn County, who recently purchased the Shire stallion, Dovecote King, from the Blackhawk Ranch, has also selected the two young mares, Blackhawk Sally and Blackhawk Belladona. Blackhawk Sally was sired by Salvadore Conqueror and her dam was Quanea Diamond, both of which had showyard records. Blackhawk Belladona was by the former state fair champion, Blymhill Forester, and is out of Witchford Darby.

The Bridgford Holstein Company of Patterson was the second largest money winner among the Holstein breeders during the year just closed. This firm won $363.75 with their test cows and was the only California herd represented in the leading 15 winners.

M. C. Tolls of Long Beach has registered "Thelones" as the prefix for his Holstein herd, and in the future hopes that animals bearing a name prefixed by Thelones will be ranked among the best.

William R. Hearst has entered the ranks of the Hereford breeders and through his representative, H. J. Heeg, was a buyer at recent Eastern sales. In the Van Natta sale seven females were selected at prices indicating unusual quality. It is reported that the cattle will be maintained on the Hearst ranch in Southern California. Two daughters of Woodford 9th, one by Woodford 4th and one by Woodford 6th and one by Weston Prince were purchased in the sale mentioned.

Palo Alto Stock Farm has recently completed a seven day record on Kiatta Pontiac Pride of 34.8 pounds butter and 747.6 pounds milk at four years, one month and six days old. Last year as a junior two year old she produced in 305 days 21,511.5 pounds milk and 706.5 pounds butter. She is being continued on semi-official this year and from present indications should set up a very creditable record. Kiatta Pontiac Pride is a daughter of Finderne Pride Johanna Korndyke and King Pontiac Segis Korndyke.

A new Hereford firm has been organized in this state by G. Ellinwood Finnell, who recently closed out his partnership holdings with Russel Richardson. The new firm includes Mr. Ellinwood and will be known as Finnel, Hall and Richardson. The herd will be maintained in Shasta County.

Entries in the livestock department of the California state fair will close August 3 and exhiibtors are requested to send in their entries at the earliest possible date.

J. J. Murphy of Weed has purchased a well bred Holstein bull from the McCloud River Lumber Company, McCloud.

Hogs sold up to $9.25 in the Fresno auction held by the farm bureau marketing association June 17. The top lot averaged 196 pounds.

Chandler, Arizona, dairymen are following the example of the Tempe dairymen and are planning the organization of a cow testing association. An association has also been formed in the Roosevelt district south of Phoenix.

At a recent meeting of the Sycamore-Cienega Cattle Growers Association at the Sycamore ranger station James Reeves was elected president; B. C. Burmeister, vice-president; Ben Stewart, secretary and treasurer; John Boyer and E. D. Thurston, members of the advisory board formed by the inclusion of all five men named. This is a newly formed cattle growers' association in Yavapai Conuty, Arizona, within the Prescott forest reserve.

A law passed by the Arizona legislature provides for restrictions on slaughtered cattle for food. Any producers slaughtering any domestic animal, intending to sell it for food, must give notice five days previously to the livestock sanitary board, describing the animal, the brands and give the owners' names. The producers must retain the hide of the animal.

Efforts are being made to reduce the head tax on cattle and sheep grazed in the San Carlos and Indian reservations in Arizona. Tentatively the reduction on cattle is from $2.00 to $1.40 and on sheep 27 cents and 29 cents instead of the former rate of 75 cents.

The recent purchase of Jerseys from the Ed Cary ranch in Oregon has arrived at the Winsor Ranch, Bonita. It includes four females by Rosaires Olga Lad, two by Poppy's St. Mawes, one by Susy's St. Mawes and a six months old bull by Rosaires Olga Lad. They are all beautiful animals.

MORE CONDENSED MILK FOR ARIZONA

By M. E. Bemis

During the period when the dairy cow was in the height of her glory as queen of the Salt River Valley of Arizona there were two large condensed milk plants in operation. One of these was the old plant which had been in operation for a number of years and later was purchased by the Armour interests. This was located at Tempe on the south side of the Salt River in the heart of the Salt River project. The other was a new plant erected by the Armour interests at Glendale.

When the success of cotton discouraged the dairymen so that they sold off their cows, the Tempe plant was closed and about one year later the Glendale plant. The one condensed milk plant and the three creameries were unable to operate with the number of cows that remained. Although thousands of cows were sold many head of young stock remained. With the decrease in the acreage of cotton and the increase of alfalfa acreage and other forage, more attention has been given to dairying, and with the heifers coming into milk this spring there has been considerable increase in milk, an increase which has taxed the capacity of the one condensed milk plant and the creameries. Through cooperative arrangement the Tempe plant has been leased by one of the local creameries and will operate under the management of the former manager of this plant. The same brands of condensed milk will be again manufactured and through the selling organization of the Armour interests markets will be opened throughout the country. This will serve to take care of the milk and cream until the dairy herds have been greatly increased, probably for the next year.

Nothing has occurred recently which is of so much encouragement to the dairy interests and in fact to the Salt River Valley as a whole as this announcement of the opening of the Tempe condensed milk plant.

A TON OF MILK DAILY FROM 30 COWS

B. C. Benson, dairy test supervisor in this state, recently furnished the Holstein-Friesian World some remarkable figures that came to his notice at the Bridgford Holstein Company's herd at Patterson.

On May 25 there were 29 cows on semi-official test in this herd. Of these, 22 were milked three times daily and given only ordinary care. Seven are milked four times daily, but outside of that their care is very ordinary. They are not pampered in any way.

These 29 cows on that day averaged to produce 68.7 pounds milk. The seven milked four times daily averaged over 81 pounds, Adirondac Wietske Dairy Maid leading with 123.4 pounds on that day. Of these seven cows three are junior two year olds and one is a junior four year old.

A majority of the cows milked three times daily are under full age. I am not aware of the exact number. The average for the 22 was 64.9 pounds. One produced over 93 pounds and only one produced under 40 pounds, seven milked over 80 pounds, and they are in all stages of lactation.

In over three years of supervising official and semi-official tests in several states I have never seen the equal of the above. And production is not the only good feature of the Bridgford herd. It is headed by King Segis Alcartra Prilly, whose two year old daughters are making wonderful records and who was grand champion at every show at which he was exhibited, including three times at the California state fair.

Special mention must be made of Bessie Veeman Alcartra Prilly, a daughter of the above bull. At the end of her fifth month she is milking over 80 pounds daily as a junior two year old. She has a seven day record of 24.81 pounds butter and 460 pounds of milk.

Anyone who visits the Bridford establishment is certain to come away commending the type and individuality of the entire herd.

Kreso Dip No. 1

(STANDARDIZED)

WILL

PROTECT YOUR PROFITS

BY KEEPING

All Livestock and Poultry Healthy

Effective. Uniform. Economical.

Kills Lice, Mites and Fleas. For Scratches, Wounds, Scab, and Common Skin Troubles.

PREVENTS HOG CHOLERA

Experiments on live hogs prove that a 2 1/2 per cent dilution of Kreso Dip No. 1 will kill virulent hog-cholera virus in 5 minutes by contact.

How to Ship Dairy Cows

EACH fall and spring there is normally a heavy movement of springers or fresh cows from the city markets and from dairy breeding regions to the milk producing sections of the country. Careful management will reduce mortality and will increase production over the flow from the average cow carelessly "railroaded."

Valuable pure bred cows usually should be handled by express service, as their increased worth for breeding purposes over that of grade animals, which are usually handled by freight service, justifies the additional expenditure for a rapid trip from the point of loading to destination. Expressage usually costs four or five times as much as movement by freight, but in the case of particularly valuable cows the saving in animal comfort, the shorter time in transit and the better conveniences for feeding and watering animals make the added expenditure advisable. In case pure bred animals cannot be handled by express, they should be loaded according to the special system discussed in this article. As far as possible, dairy cows should be shipped one or two months before they are due to freshen, as repeatedly fresh cows have been ruined, so far as the subsequent lactation period has been concerned, as a result of being shipped shortly before freshening or so as to calve in transit.

Milk cows of grade breeding ordinarily are shipped by freight, dry cows and far springers being most desirable for long shipments. Heifers which are not due to freshen until three or four weeks after arrival at destination make good "buys," as they are of a size and condition which permits of loading the car to capacity. Furthermore, immature animals are less susceptible to injury in transit and to damage as a result of change of environment. So far as possible, animals without horns should be shipped, and where it is necessary to carry any horned animals in railroad cars they should be penned apart or tied securely at one end of the car, so that they cannot injure any of their traveling mates. Where bulls are shipped in mixed carloads, these sires should be confined in pens apart from the other cattle.

Other conditions being equal, it is recommended by specialists of the United States department of agriculture that about 14 mature cows be loaded in a 38 or 40 foot car. A practical arrangement is to tie four cows in each end of the car, facing the end walls, and then rough partitions can be installed so that two other rows of three cows each face a center alleyway between the car doors, where the attendant can stay and extra feed and water can be carried. This arrangement is most comfortable for the cows, as they ride and absorb the shock and jar better, while it also facilitates the operations of the caretaker in feeding the cows and cleaning the car.

Dairy animals, although they require neither petting nor pampering, should be handled under normal conditions before and during the railroad trip. The cows should be fed and watered at regular intervals, and if any of the animals are in milk they should be milked according to regular schedule. It pays to feed grain and hay during a long shipment where the cows are accustomed to these feeds. It is difficult to feed grain in a freight car where no special provisions are made to prevent wastage, as a result of the tendency of the animals to move about where they are not held securely in place. However, on long trips grain can be carried in the car and fed at all points where the stock is unloaded. A competent attendant should always accompany the dairy cows; he should ride in the car with the stock, as often he can avert injury to the animals by prompt action in case one of them gets down or otherwise gets into trouble.

Several large barrels of water, as well as plenty of feed, should be carried in the car as insurance against delay or accident which may detain the train to the extent that without this feed the animals might go hungry or thirsty far beyond the 36 hour limit. Sand is one of the best bedding materials, and during long trips fresh supplies of it should be placed in the car at unloading points whenever they are needed.

THE VALUE OF MANURE

"New countries rarely appreciate," states F. S. Harris of the Utah agricultural college, "the value of barnyard manure. It is not until the soil begins to be depleted of its fertility and the yield of crops begins to decline that manure is given the attention that its value justifies. In new counties it is not uncommon to see manure hauled into a rut in the road or left in scattered heaps along the roadside or the ditch bank. Often a year's accumulation of manure is drawn out of the barn or corral in scrapers and added to a pile containing the accumulation of previous years.

"As the development of the country progresses the rancher begins to feel himself in luck when he has a chance to get his yards cleaned for nothing. A nearby farmer hauls the manure to his own farm, receiving the manure for his trouble. The rancher is likely to consider himself particularly fortunate if he is able to get 25 or 50 cents a ton for the manure besides getting it out of the way. It is not usually until high priced cash crops are raised that the farmer is made to realize how valuable manure really is."

Mr. Harris summarizes the results of experiments as follows:

"The idea sometimes expressed that Utah soils are so fertile that they do not need manure is certainly not borne out by these experiments.

"Manure applied to sugar beets at the rate of ten tons to the acre gave an increase in yield of about one ton of beets for each ton of manure. Five tons to the acre gave nearly two tons of beets for each ton of manure, but where as much as 40 tons to the acre were applied the increase was only about four-tenths of a ton of beets for each ton of manure.

"Where potatoes were manured at the rate of five tons to the acre the yield was increased by nearly 13 bushels for each ton of manure, but where 40 tons were applied the increase was only 4.3 bushels for each ton.

"Manure applied to wheat gave an increased yield of two bushels for each ton of manure where five tons were applied, 1.13 bushels where 15 tons were applied, and only .33 bushel for each ton of manure where 40 tons were applied.

"Manure applied to oats gave an increase of 1.65, 1.21 and .36 bushels of grain respectively for each ton of manure when 5, 15 and 40 tons of manure to the acre were applied.

"The average of nine years of manure applied to corn gave an increase of 3.83 bushels of grain and 428 pounds of stover, and 1.61 bushels of grain and 214 pounds of stover respectively for each ton of manure when 5 and 15 tons were applied to the land each year.

"The use of farm manure under dry farming conditions does not seem to be so immediately profitable as under irrigation; the residual effect of manure under dry farming is very marked.

"The use of manure on expensive crops such as sugar beets and potatoes gave a higher return for each ton of manure than when it was applied to wheat and oats.

"These experiments bring out clearly the fact that manure is much more valuable on Utah soils than it is usually thought to be."

SOME ARIZONA CENSUS FIGURES

The census bureau figures recently released as to livestock in Arizona are as follows:

	No. 1910	No. 1920	Value 1920
Horses	93,803	136,167	$5,744,671
Mules	3,845	11,992	1,415,397
Range and Beef Cattle		768,197	
Dairy Cows		53,721	
Total Cattle	767,042	821,918	35,500,759
Sheep	916,600	881,914	7,123,719
Goats	161,124		
Swine		49,599	885,590
Chickens	252,657	495,065	
Hives of Bees	23,770	28,174	

BULK HANDLING WILL SAVE MILLIONS

Farm bureau centers throughout the state have been discussing bulk handling of grain and the facts disclosed at these meetings have resulted in the belief that millions of dollars will be saved annually if farmers discard the costly method of handling grain in sacks. The cost of installation of metal grain bins on the farm, the building of grain tight wagon boxes and the erection of miniature elevators or loading stations on railroad sidings, it is claimed, will soon be met by the greater economies of bulk shipment.

Robert N. Clapp of Nuevo has sold ten heifers of the King Segis Pontiac breeding to the Santa Monica Dairy Company, the firm which owns the great bull, King Segis Pontiac Jannek, formerly herd header for J. J. Jeffries.

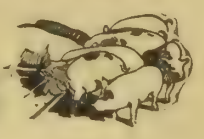
Cream Calves and Pigs



A Missouri farmer writes:

"I bought a De Laval Separator and in 12 months I sold $400 worth of cream, and received $150 for calves and $270 for pigs which I raised on the skim-milk. I can truthfully say the De Laval Separator is the most profitable investment I have made for some time."

This is not an unusual instance of what a De Laval Separator will do, and thousands of farmers have done even better.

The De Laval Separator saves the most cream and gives you the greatest cash income. It provides skim-milk in the best condition for feeding calves, pigs and poultry. And it gives this excellent service over the longest period of time. That's why there are more than 2,500,000 in use the world over. It is the best and in the long run the cheapest.

Easy terms can be arranged so that it will pay for itself. See your De Laval agent or write us.

Ferndale, June 20, 1921.

California Cultivator,
Los Angeles.

Dear Sir:

Received your check for $25 and I thank you. It came as a surprise to me, as I didn't think I would win any prize, for when I came on the place on January last I found it badly run out and I haven't the feed I should have for my cows, but I am willing to take a tip any time, which is encouraging to me. In the last ten years I have tried different breeds of cows but from now on my motto will be "Jerseys for mine."

Thanking you again, I remain,

Eugene Biondini.

Nate Hauck, grades: Bally, 1,992 pounds milk, 88.41 pounds fat; Brownie, 1,602, 80.10; Nigger, 1,782, 73.06; Slow, 1,525, 70.15; Brindle, 1,943, 69.94; Speck, 1,705, 66.49; Strap, 1,336, 58.12; Sister, 1,091, 52.36.

John Rowe & Sons, Shorthorns: Alma, 1,469 pounds milk, 53.75 pounds fat; Greenhill Caroline, 1,543, 53.24.

Olga Saxer, Holsteins, Moorland Col. Rose, 2,990 pounds milk, 100.77 pounds fat.

W. Terkelsen, grades: Christina, 1,773 pounds milk, 81.56 pounds fat; Annie, 1,479, 78.39; Laura, 1,662, 76.45; Friday, 1,209, 71.33; Amy, 1,302, 66.40; Lucy, 1,401, 64.45; Edna. 1.091. 62.19: Ethel, 1,172, 60.94; Evelyn, 1,386, 59.60; Lina, 1,187, 58.16; Monday, 1,113, 56.76; Babe, 1,175, 55.23; Pale Face, 1,344, 51.07.

University of California, Guernsey and grade: Calif. Questa Queen, 1,133 pounds milk, 54.17 pounds fat; Ramona, 1,527, 50.38.

H. L. Wakeham, grades: Jim's Wonder, 1,993 pounds milk, 103.64 pounds fat; Big A, 1,283, 71.85; Brown Jersey, 1,286, 59.16.

R. H. Walrath, grades: Pansy, 1,522 pounds milk, 62.40 pounds fat; Minnie, 1,417, 60.93; Amy, 1,383, 52.55.

Warne & Sons, Holsteins: Fayette Segis, 2,156 pounds milk, 72.64 pounds fat; Bessie Abbek. Col. 2d, 1,795, 56.54; Miss Floa Juliana, 1,848, 53.96; Bertha Pontiac J. 2d, 1,733, 52.

The reports for May so far received show that 618 cows in milk during the full month produced an average of 1,243 pounds milk and 50.65 pounds butterfat (average number of days in milk at the beginning of the month, 117).

Two cows produced over 100 pounds butterfat during the month; the one, a grade Jersey, Jim's Wonder, is owned by H. L. Wakeham of Santa Ana (1,993 pounds milk, 103.64 pounds butterfat). This is the fourth month during the present lactation period that this grade has produced over 100 pounds butterfat, and her total credit to date is 511.75 pounds butterfat during 151 days, equivalent to nearly 600 pounds commercial butter, or an average of almost four pounds per day for five months. The other cow producing over 100 pounds butterfat during the month is a pure bred Holstein, Moorland Colantha Rose, owned by Olga Saxer of Modesto (2,990 pounds milk, 100.773 pounds butterfat). This cow has poduced over 550 pounds of butterfat during 166 days of the present lactation period, a similar average production per day for the period as that of the peceding grade.

Two cows produced between 90 and 100 pounds butterfat during the past month, 21 between 80 and 90 pounds, and 47 between 70 and 80 pounds. This is a larger proportion of exceptionally high records than during any previous month of the competition.

The California Cultivator prize for May was won by Eug. Biondini of Ferndale, for an average production by five grades of 82.26 pounds butterfat (ranges, 76.9 to 89.9 pounds). These grades stand first among the groups of five cows in 27 different dairy herds that competed for the Cultivator prize for the past month. The average production for the grades in all the herds but six came above 50 pounds of butterfat, the lowest producing group averaging 33.36 pounds butterfat for the month. Five grades in the herds owned by the following dairy farmers produced on the average over 50 pounds of butterfat: Eug. Biondini, 82.26 pounds; N. Hauck, 76.33 pounds; J. A. Genzoli, 75.81 pounds; W. Terkelsen, 74.83 pounds; Earl Graham, 71.09 pounds; W. E. Early, 70.42 pounds; Peter Iversen, 70.04 pounds; M. L. Pontoni, 68.75 pounds; Giacomini & Pedrotti, 68.61 pounds; Leo. Christen, 68.27 pounds; H. L. Wakeham, 66.36 pounds; J. B. Harbers, 65.63 pounds; Los Angeles County Farm, 64.33 pounds; W. B. Gries, 63.34 pounds; Arden Dairy, 61.17 pounds; F. F. Pellissier, 60.62 pounds; Napa State Hospital, 59.63 pounds; Adohr Stock Farm, 56.69 pounds; R. H. Walrath, 53.94 pounds; El Mirador Dairy, 52.56 pounds; and J. C. Broady, 50 pounds. This is the second time that the Cultivator prize has been won by a Humboldt County farmer, and also the second time in eight months that it has gone outside of Los Angeles County.

PICKINGS FROM THE CENSUS

There are 9,506 farms in California reporting pure bred livestock of some kind. Five hundred eighty-eight of these report pure bred horses. More than half the number of farms having pure bred stock report pure bred cattle, or, to be exact, 5,179. Of course the dairy breeds predominate, as is reported from 3,959, while the beef breeds are reported from 1,401. Pure bred sheep are maintained on 371 farms, while swine are a favorite and bred on 4,886 farms.

The horses are divided up as follows: Percherons, 769 of both sexes. The next favorite is the Belgian, 152; Shires, 110; Thoroughbred, 113; American Saddler, 27; Clydesdale, 37; German Coach, 24; Standard, 35; all others, including ponies, 348. Total pure bred horses, 1,615.

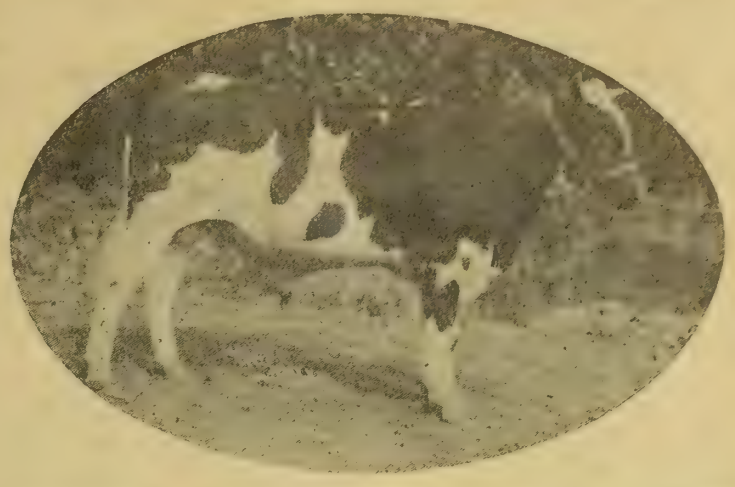
As shown by numbers the Hereford is the favorite of the beef breeds. There are 5,238. It is rather surprising to note that the numbers of Polled Durhams and Shorthorns are almost identical. Polled Durhams report 3,100, Shorthorns report 3,045. Aberdeen-Angus come next with 1,182, with the Devons showing only 124. Total, 13,244.

Dairy breeds give the place of honor to the Holstein. Of that breed there are in California 12,189. Jerseys are second with 3,832. Guernseys are third with 1,145. Then come Ayrshires, with 595; Brown Swiss, 36; all others, 1,347. Total, 19,144.

In sheep the Rambouillet is the leader with 15,175; Shropshire, 6,242; Merino, 5,010; Hampshire Down, 1,372; Lincoln, 148; Dorset Horn, 48; others, 768. Total, 28,831.

The Duroc-Jersey is the favorite of the swine breeds with 14,153; Poland China, 11,146; Berkshire, 5,348; Hampshire, 2,699; Chester White, 997; Yorkshire, 333; Tamworth, 96. Total, 35,741.

Sir Prince Aaggie Mead



Representing One of the Greatest Mead-Aaggie Acme Crosses

His sire, KING AAGGIE MEAD, is the one and only son of the great King Mead of Riverside retained for service in the A. W. Morris & Sons herd, and is thus by a son of De Kol of Valley Mead, founder of the great Mead family, and is out of Aaggie Acme of Riverside, founder of the now famous Aaggie Acme family.

His dam, MISS VALLEY MEAD DE KOL WALKER, the greatest female descendant of De Kol of Valley Mead yet developed, and rated as one of the breed's greatest young matrons. She has three splendid sons in active service to transmit her tremendous production and excellent type.

SIR PRINCE AAGGIE MEAD is being mated with some of the highest class females in both our herds. Keep your eye on his get, for you will want one of his sons in your own herd later on.

Owned by:

Fred Hartsook, Lankershim, Cal. and A. W. Morris & Sons Corp., Woodland, Cal.

ORMSBY BULLS

The daughters of Sir Ormsby Skylark are making wonderful yearly records. We have a number of their sons sired by sons of Sir Pietertje Ormsby Mercedes for sale at Farmers' Prices. We want you to know the individuality, conformation and production these bulls will put into your herd.

You Can Buy a High Record Bull Right

Every animal tuberculin tested and guaranteed a breeder.

Maxwell Farms **Hollywood, Cal.**

Stop & Consider

TYPE -I- World's Record in Production

SYCAMORE ACRES

I have more females in my herd who are either sisters or daughters of the following bulls than any herd in the United States:

KING SEGIS PONTIAC

King Segis Pontiac Alcartra—His $50,000 son.

Catalogues and Booklets, office forms and correspondence stationery for the nursery, seed and florist trade; half tone cuts of many standard plants. Correspondence invited. The Kruckeberg Press, 236 Court St., Los Angeles

HARNESS

Chain Harness — Save money buying of Davis Saddlery Company, 427 J Street, Sacramento. Good horse collars, $5.00 and up.

NAMING THE FARM

Here is the text of the California law as to procedure necessary to secure exclusive right to your chosen name for your farm. It is worth keeping for some day, no doubt, you will decide that your farm, as a business proposition and as a home, is worthy of a distinguishing title.

"Any farm, ranch or villa owner in this state may upon the payment of one dollar to secretary of state, have the name of his farm, ranch or villa duly registered in a register which the secretary of state shall keep for said purpose, and shall be furnished a certificate, issued under seal, and setting forth the name and location of the farm, ranch or villa, and name of the owners; provided, that when any name shall have been recorded as the name of any farm, ranch or villa, such name shall not be recorded as the name of any other farm, ranch or villa in this state, except by prefixing or adding of designating words thereto. The secretary of state shall register such name only for the person entitled thereto.

"Any person, who shall register as his own, any such name already in use in this state, knowing such name to be adopted as the name of a farm, ranch or villa therein, or shall make use of such name when regularly registered and in use by any other person entitled thereto under the provision of this act, shall be guilty of a misdemeanor."

THE BIG NOISE

An Italian fruit dealer was caught in the railroad yards in his Ford truck. Becoming excited, he killed his engine, stopping the truck on the track, from which it was knocked by a switch engine. Next day a friend asked him if the car was badly damaged.

"Yes," replied the Italian, "he pretty bad smasha up."

"Did it damage the engine very much?"

"No, I tanka not. De horn he stilla blow."

HONORABLE TROPHIES

An army recruit went on parade one day with six medals on his chest.

"Ah," said his officer, "you have seen service?"

"No, Sir."

"Then what are those medals? You have no right to them!"

"Sure I have. Didn't my pigs win six first prizes at the county fair?"

NOT ON SPEAKING TERMS

Mother: Joan, darling, run and call Fido, will you?

Joan: I don't see how I can, mummy, 'cos I aren't speakin' to Fido since he broke my doll.

The Business of Farming

ONE of the most serious questions confronting the farmer today is that of securing labor. Its cost is exceptionally high; its quality, while better than a year ago, is still desperately low. So the farmer is asking "How can we produce more and at the same time employ less labor?"

In an address delivered before the Columbus Tractor Show committee President Finley P. Mount of the Advance Rumely Company argued for more extended use of farm power. He said:

"Six years before the Clermont steamed up the Hudson under its own power Robert Fulton had demonstrated his invention on the River Seine before the most distinguished body of scientists the great First Consul could get together. The verdict of this French jury was negative. They believed their eyes, but they also believed the old ways better than the new ways. They pronounced navigation by steam entirely too expensive to be practical. As a result the invention of the steamboat and the honor of applying steam to navigation on its own waters came to this new and untried country of America. One trial before America resulted in immediate adoption and pushed the whole world farther forward on its road to commercial progress than all that had gone before.

"Of every modern invention designed to increase the power and productivity of man, to lift civilization from a primitive state of barter to its present highly organized system of modern commerce, a like story can be told. Always it is the quick adaptability of the American, who promptly drops the old, seizes upon the new, and just as promptly takes primacy in the world of progress. It was so of the railroad, of the telegraph, of the telephone, of applications of electricity in all its phases, in the mine, in the factory, on the farm; from the primitive hand needle to Elias Howe's sewing machine, from the slow process of man power to Eli Whitney's cotton gin, from the highly developed horse to the modern automobile, from the most up-to-date bookkeeper to the Burroughs adding machine, from the sickle to the scythe and cradle, from these to the McCormick reaper and then on up the line to the modern binder and modern harvesting machinery, from the ox yoke and goad to the neck yoke and reins and thence to the steering wheel of agriculture's latest and greatest invention, the modern farm tractor. Always it is the same story. He has substituted mechanical power for living power. He has multiplied an hundredfold the power of human hands; he has applied brain as well as brawn to all his problems and he stands today in all lines of human endeavor the greatest producer per man power involved the world has ever seen.

"This statement is particularly true of the American farmer. The European produces more food per acre farmed than does the American, perhaps on an average twice as much, but the American farms ten times the acreage of the European. The average acreage farmed per man in Europe is less than five; in America it is more than 50. It is intensive against extensive production. So long as the land and equipment hold out the odds will remain five to one in favor of America.

"The thing which has enabled the American farmer to hold this position is his readiness to take on improved methods and particularly his use of power farming machinery. The story of the development and expansion of American agriculture in the last hundred years reads like a romance. In 1820, 95 per cent of the population of the United States lived on farms and engaged in the production of food for themselves and the remaining five per cent in the cities. By the census in 1920 but 48 per cent of the population of the United States live on farms and 52 per cent live in cities.

"What is it that has made possible this tremendous change in the producing power of the American farmer? What is it that has made it possible for 48 American farmers to do what 100 years ago it required the work of 85 to accomplish? It is improved agricultural machinery, and the latest and greatest of these is the farm tractor.

"The 300 million acres devoted to farming in 1850 increased in 1875 to 500 millions and is now well over 900 million acres, and of this but little over half is actually devoted to the raising of crops. Land has always been and yet is so abundant in this country, and comparatively cheap, and labor, even before the great war, had become so scarce and commanded such high wages that the American farmer has been forced to extensive rather than intensive methods of farming, and this, of course, means the increasing use of power farming machinery.

"When we speak of power farming machinery, our minds naturally revert to the farm tractor, because the farm tractor is the newest form of labor saving and crop increasing tool created for the farmer's use. It must not be overlooked, however, that while the farm tractor and the power plow are of vast importance in increasing the wealth of the nation, the grain separator, the corn harvester, the ensilage cutter, and the hundred and one other power driven machines hold the very important position of saving or converting the crop after it is produced."

IMPORTING MILK PRODUCTS

Answering query from a subscriber as to tariff and internal revenue taxes on margarine and milk products Sam H. Greene of the Dairy Council writes:

"There has been no 'process' butter sold in this state for a number of years so far as I know. Process butter is made in the large cities of the Mississippi Valley. In this territory there is a large quantity of farm butter. Farmers usually keep two or three cows and therefore have a small surplus during the spring and early summer. As they do not produce enough cream to sell to a creamery they make butter on the farm. It is either traded out at the store or bought by peddlers who go through the country for that purpose. Of course it is of all kinds, qualities and conditions. It eventually finds its way to the big cities, where there are concerns that made a business of melting it, removing the salt and impurities, deodorizing it and then reworking it with sweet milk or cream and resalting it. The resulant product is termed process, or renovated butter. All such butter pays a tax to the United States government through the internal revenue department.

"Oleomargarine is also taxed by the federal government. If it is uncolored the tax is one-quarter cent per pound; if colored, ten cents per pound. This, you undersand, is an internal revenue tax.

"There is an import duty upon butter from foreign countries of two and one-half cents per pound. The same applies to oleomargarines coming in from foreign countries. No oleomargarine is imported.

"There is an emergency tariff bill now being considered by congress which carries an import duty of six cents per pound on butter. I do not know if it carries a duty on oleomargarine, but I assume that it does. There are two kinds of oleomargarine manufactured in the United States. One is made from animal fats, either with or without the addition of a small percentage of butterfat. The other is made from coconut oil and skim milk. It contains no butterfat. Four years ago we were using in California less than half a million pounds of oleomargarine of both kinds. For the 12 months ending June 30, 1920, the sales in this state were a little over ten million pounds, mostly of the coconut oil variety."

LIVESTOCK COST ACCOUNTING PAYS

Under present market conditions it becomes more necessary than ever, says W. H. Peters, head of the animal husbandry division at university farm of the Minnesota college of agriculture, that the stock grower should know what it is costing him to produce the different types of stock on his farm. A separate account should be kept for each kind of stock, the following items featuring each account:

An inventory of the stock at the beginning of the year.

All feeds used and these should be charged for at the prices prevailing locally at the time of year when they would have been marketed had they not been fed to the stock.

A fair rental for all pasture land used.

The cost of all animals purchased during the year.

Interest, depreciation and insurance on the equipment other than the stock itself.

Insurance on the stock, if carried.

Labor used in caring for stock.

Care should be taken in making the inventory, estimating as accurately as possible the amount and value of feeds consumed and the amount of labor used. It is seldom practical to weigh all feeds used, but the amounts can be estimated accurately enough so that the cost record will be reliable.

Then in striking a balance at the end of the year a careful inventory of all stock should be made again and this, together with the money received from sales and a reasonable allowance for manure produced, should be totaled for the credit side. All the items listed above should be totaled for the debit or cost side. The credit total minus the debit or cost total will represent the interest or dividend on the capital invested in the stock.

Such an account will show weaknesses in the average method of handling livestock and the places where costs have been too high, also some possibilities for reducing costs in the future. The paying and non-paying types of livestock will be disclosed. No manufacturer can make his business pay without an accurate system of cost accounting. It is at least reasonable to assume that a careful system of accounts will help materially to show the livestock producer wherein his big problems lie.

FIGURING THE BULL'S VALUE

If the value of a pure bred sire in a grade herd of dairy cows was fully appreciated by the average dairyman the dairy situation in this country would in a comparatively short time be on a much higher plane than is now the case.

Probably the best way to convince a farmer of the value of a change from his old beaten path is to show him by figures and facts the increase in hard dollars and cents due to a new practice. For that reason the following case is given: Suppose we take a herd of 20 grade cows which have an average milk production of 4,000 pounds per year. It is very easy, by the use of a good pure bred bull, to increase this production 1,000 pounds in the offspring. If this milk is worth $2 per hundred pounds on the farm, which is a conservative estimate, the yearly increase will be $20 per cow over the original cows which produced 4,000 pounds. Now then, what is a pure bred sire worth at the time of purchase simply from this standpoint?

The average life of the cows we shall figure as eight years, six of which they will be giving milk. The rate of interest shall be five per cent. If we purchase our bull today it will be at least a year before all our cows have calved and it will be an additional two years before these heifers are in milk. Thus we see we cannot figure our profit before the end of the fourth year.

Value of increased product per cow per year: Fourth year, $20; fifth year, $41; sixth year, $63.05; seventh year, $86.20; eighth year, $110.51; ninth year, $136.04.

The total value of increase per cow at the end of nine years is $136.04. This amount nine years hence will only be worth $87.70 today. Thus we see that the cash value increase per cow is $87.70 at the time of purchase of the bull. In this herd we should expect to get nine heifer calves, and of this number there should be six of sufficient merit to raise. So multiplying $87.70 by six we get $526.20, which is the true cash value of the bull at the time of purchase due to the value of increase in milk production in the first generation. The larger the herd the more the bull will be worth.

The dairyman cannot make a better investment than to buy a pure bred bull of good stock to head his herd. Join a cooperative dairy bull association. See your county agricultural adviser about it.—University of Illinois.

ALFALFA GROWERS' ORGANIZATION

The reorganized Alfalfa Growers should move right along to a successful consummation of all their plans for the stabilizing of prices and the salvation of their industry.

It is an industry absolutely essential to the welfare of California. And as other important industries have been saved to their owners and to the world by the adoption of the cooperative method of marketing, there is every reason to believe that this great basic source of wealth and means of preserving life will also be maintained in volume of product and satisfactory average of returns, once the growers organization shall secure control of the situation.

It is a mystery why farmers in any line in California should hesitate about organizing for cooperative marketing.

The system has done so much for the raisin and peach grower and is doing so much for farmers in many other lines that it would seem safe to assume that no producer would think of sticking to the old discredited competitive selling under which the industries mentioned were threatened with extinction, and by reason of which the farmers of wheat and other staples are now suffering unprecedented losses. The lesson should have been learned, long ago, by every farmer in the land, and not a pound of farm product should now be finding its way to market through the old competitive channels.

No more time or money should be lost. Farmers should organize everywhere, and in all lines of farm industry for the intelligent cooperative marketing of their crops.

But in the alfalfa business the organization is already formed. Much good was accomplished even under the former imperfect organization. Now, with a richer experience and solider organization, there should be no trouble in securing a proper price for the commodity. That is all the alfalfa grower asks for, and that he is fully entitled to receive.

Growers should remember that the result depends upon themselves. Organized they can secure their full rights; disorganized they are at the mercy of circumstances similar to those that have always operated to the disadvantage of honest industry.

Why should any farmer hesitate between such alternatives? There should be no waiting. Every alfalfa grower who has not already done so should at once ally himself with the organization, selling his crops through it, to the advantage of himself, his neighbors and the state.—The Cooperative Californian.

GRAPE WILD FARM

A. B. Humphrey, Owner Escalon, Cal.

Grain Growers Marketing Plan

The U. S. Grain Growers, Inc., is sending out a booklet of information, "Grain Marketing Plan of the Committee of Seventeen," which explains the working plan of the great cooperative organization of the grain growers of the United States. Copies may be had by writing U. S. Grain Growers, Inc., 59 East Madison Street, Chicago. From a circular sent out by President Gustafson we quote:

There are two things which farmers must do to assure success for this historic movement:

First, pay $10 for a life membership in the U. S. Grain Growers, Inc., and sign the grower's contract.

Second, subscribe, wherever it is at all possible, for stock in the Farmers' Finance Corporation, admittedly the most important phase of this promising effort to remedy the injustices to which the farming community is subjected.

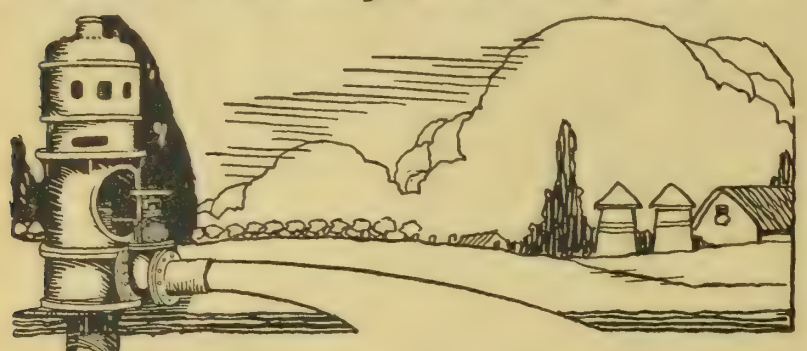
Stock will be issued in amounts of $100 and up and certificates will be offered for sale by membership solicitors while organization work is in progress, thus eliminating the expense of a second campaign.

No farmer can afford to lose sight of the importance of the Farmers' Finance Corporation. It ranks second only to the U. S. Grain Growers, Inc., itself, and if carried to fruition will put the farmer in a position where he will be independent of unsympathetic financial interests for all time. The Farmers' Finance Corporation will be a $100,000,000 corporation, and in point of magnitude will be second to only one other finance institution in the United States. However, it will be concerned only with the financing of farmers' cooperative marketing organizations. The needs of the farmer owned national grain sales company, of course, will come first, but it will be friendly to cooperative organizations concerned in the marketing of all farm products.

The Farmers' Finance Corporation will be under the supervision of the same farmer directors who are responsible for the U. S. Grain Growers, Inc. The Farmers' Finance Corporation will have a standing in the business world that will not be excelled. It will be the farmers' own credit institution upon which the grain growers and other farmers may depend.

Farmers' money is now and always has been used to finance the business interests of the nation. This corporation will remove all chance of producers' money being used in channels opposed to cooperative marketing. Briefly stated, a request that you subscribe for stock in the Farmers' Finance Corporation is merely a proposal that you invest some money in your own business.

The cheapest water



CHEAP water is that which costs the least per gallon. Only the finest machined pumps can produce the cheapest water.

This is the reason for the wide-spread adoption of Byron Jackson deepwell turbine pumps. Through their daily performance extending over a period of years these pumps have demonstrated their ability to deliver the most water for the least cost, both as to power and maintenance.

Our engineering department is at your disposal—no obligation on your part.

Alfalfa Growers Market Letter

Receipts of alfalfa hay, while somewhat larger than during preceding weeks, are still light for this time of the year and consist largely of ordinary and low quality hay. It now looks as if this year's production would in most parts of the state fall short the equivalent of at least one cutting and probably decidedly more than that as far as the higher grades of hay are concerned. The market continued firm with a further stiffening up in the prices of the higher grades, offerings of which have become very light. Supplies in the hands of dealers and users still remain very small. Current prices are of course still too low, from the standpoint of cost of production plus a legitimate margin of profit, but it would be a mistake on the part of the growers to expect a rapid return to adequate prices. Such a return must come gradually or it cannot be maintained. It would lead to violent and erratic price fluctuations, thereby unsettling business more than ever and postponing the return of stable conditions of regular demand and free consumption. We must bear in mind that it was the very unfavorable money and credit situation, beginning last fall, which brought about the intense and long drawn out general business depression and tremendous price declines, and which in turn compelled dealers and users of alfalfa to reduce and practically exhaust their stock on hand and then buy from hand to mouth only. This situation was not less unsatisfactory to dealers and users than to growers, but there was no help for it. While this general depression has not yet disappeared it has of late become gradually less severe, encouraging the belief that we are on the road again to normal conditions, and making alfalfa buyers disposed to again take hold more freely, especially in view of the inherent strength of the alfalfa situation. Further improvement in the money and credit facilities being promised by the authorities, from President Harding down, we may look for a further gradual improvement in the alfalfa market and the alfalfa business generally, provided of course that these promises are kept. This return to normal conditions can, however, only be brought about by the buyers feeling reasonably sure that they are running no serious risk in buying freely at the current prices during the next few months and are also fairly sure of finding it profitable to do so. It would therefore be a mistake on the part of the growers if they were to discourage this demand by advancing their prices too quickly. We do not mean by this that we advise growers against holding part or all of their hay for sale next fall and winter, if they want to do so; on the contrary, it is very desirable that a substantial part of the production should be so held back by the growers who are able to carry it in order to fill the demand during the six or seven months of the year during which no hay is being produced. What we advise against is the refusing of fair offers during a time of good demand by growers who need the money to meet their current obligations; they should make up their mind to keep their sales a little ahead, if possible, and not behind their money requirements, so that afterwards they do not have to force sales at the wrong time. If after having made these provisions they wish to hold the balance of their production they are then in much better position to do so. In other words, our endeavor is to come as near as possible under existing conditions to establishing a market throughout the year on basis of cost of production plus a fair profit, and of course a fair additional margin for such part of the production as will have to be carried for consumption during the non-producing time of the year. By thus doing all we can to stabilize the market on a fair basis and at the same time give due consideration to the protection and promotion of the other legitimate interests of dealers and users, we believe we are operating in the best interests of buyers as well as producers.

COTTON WAREHOUSES APPEAL FOR LICENSES

There has been a marked increase in the demand for cotton warehouse licenses during the past year. In the administration of the United States warehouse act 242 such licenses were issued since July 1, 1920 by the bureau of markets, United States department of agriculture, and applications were received for 289. During the previous year 106 applications were received and 24 licenses issued. The increased interest in the licensing of cotton warehouses is thought by department specialists to be due largely to the following facts:

The Atlanta federal reserve bank is actively encouraging warehousemen to become licensed and bonded under the United States warehouse act and a cooperative agreement has been entered into with the Georgia state bureau of market whereby the state bureau furnishes a free grading service to all licensed warehousemen who desire it. The governor of the federal reserve bank at Dallas has recently taken an active interest in the act and is circularizing member banks in his district in advocacy of the federal system of warehouses.

Very substantial reductions in the rates of fire insurance on licensed warehouses have been granted by the various rating bureaus in the South. In a majority of Southern states this reduction amounts to 25 per cent from the scheduled rates; in other Southern states the reduction ranges from 25 per cent on certain classes of warehouses to 10 per cent on others. Ten per cent is the minimum concession. The federal farm loan board has approved forms of receipts to be used under the regulations and steps have been taken to secure like approval from the federal reserve board.

CONDITIONING THE PULLETS

(Continued from Page 5.)

is done. The feeds carrying a great deal of protein, animal protein especially, should be cut down. The feeds carrying a great amount of fiber, such as bran, ground oats, alfalfa meal, which the birds should get during the summer or growing season, should be cut down, and the feeds carrying great amounts of carbohydrates or fattening elements and small amounts of fiber should be materially increased.

"The simplest and perhaps the handiest way to make this change under ordinary circumstances is to add more cracked corn to the scratch feed and to increase the amount of corn or hominy feed in the mash by about double the amount of feed used during the summer. Increase the amount of scratch feed given daily until they get about all they will clean up, and it will be found that if the corn is of good quality, dry and sweet, the birds will eat almost their whole ration of this scratch feed. Sometimes they may leave a few oats or barley. If they do, don't cut down on the amount of scratch given, but decrease the amount of these feeds in your scratch feed." This extra amount of fattening feed is given for a month or six weeks and dropped as soon as the pullets seem in good condition and anxious to lay.

I have mentioned briefly these three theories in regard to preparing pullets for their winter work in the hope that my readers will each one work out his own system of pullet feeding, and having found what worked best, hold onto it. We are all learners together and the last word is yet to be spoken.

POULTRYMAN'S CALENDAR—JULY, CLEAN-UP MONTH

July is not always housecleaning month. Many years this work must be done with the first hot days of June. This season is late, and after the cool, foggy weather of May and June the hot July days will see an army of mites breeding in every neglected henhouse. Now is the time to clean out dust and cobwebs, as well as every bit of manure, to freshen up nest and scratching litter, to hose the walls, using boiling water on ends of roosts and other places that show the dull gray of mite infestation, and then to disinfect with carbolineum or with kerosene and crude carbolic acid or a cresol preparation. Disinfect twice, a week apart, and then a third time for luck, and there will be no more mites unless they have hidden in cracks out of reach of the disinfectant. Spade the yards that have not been already purified with a green crop, and sow barley in them. The hens will dig up most of it, but some may sprout if it is watered. In any case the hens get the exercise and the barley. If the birds can be moved to another yard for the summer or allowed to run in the orchard it will be good for them and for the houses.

Clean up the flock as well as the houses. Get rid of birds that are plainly unprofitable and reduce the flock to its lowest terms, for the sake of both health and sanitation. The fewer birds there are in a house the easier it is to keep it clean and them healthy.

Poultry Queries

Conducted by Jean A. Koethen

Bald Heads

Can anyone tell me what to do for hens that lose their head feathers? I have a few that get perfectly bald every spring and put on feathers again when they molt.—Subscriber, Los Angeles.

If a male is running with the hens I should be inclined to blame him for the loss of head feathers. An active male often loosens the feathers in the heads of his harem. There is a mite which sometimes eats off the feathers on various parts of the body of fowls, but they would not grow again after the molt if such a mite were there. If you find any indications of its presence, such as rough ends of feathers or debris at their base, you might anoint with a mixture of lard and sulphur, half and half.

Poultry for Profit

Will you please advise me where I can purchase and the price of your valuable book, "Poultry for Profit." I have borrowed it from a friend and would like to have one of my own as I am a beginner and your book has lots of good advice and ideas.—Subscriber, Santa Rosa.

Thanks for the kind words. "Poultry for Profit" may be had from the Cultivator, 115 North Broadway, Los Angeles, and costs one dollar. It was written for beginners and aims to give necessary information simply and accurately.

Coccidiosis

Please tell me what causes the disease called coccidiosis. Does it only appear at about five or six weeks in young chicks? I had a flock of 1,000 five weeks old chicks and they were absolutely fine and in one day it looked as though the whole flock would die. Lost 100 in four days. The directions for using Lactein are to discontinue mash altogether. Does this mean that mash is not very safe food? I fed mash (P. C. A.) from 8 a. m. to 12 daily. Would it be safer and as well to feed half of mash and same of bran until, say eight weeks? I never had this experience before as my chicks were good after about the first ten days. What can be done to prevent this disease? Thanking you for much useful and helpful information.—Subscriber, Inglewood.

Coccidiosis is seldom seen except in large flocks and most frequently those kept on the same soil for several years. A liberal use of buttermilk or clabbered sour milk is the best cure. If milk is not available a teaspoon hydrochloric acid to quart of drinking water sometimes gives good results. In order to make the chicks drink as much sour milk as is necessary the mash must be limited. Probably this is what is meant by the directions for using Lactein. "Feed a small amount of grain night and morning," is Dr. Beach's advice. "Feed mash during the middle of the day, never leaving it before the chicks longer than two hours. Feed greens as usual. Keep buttermilk in fountains constantly before the chicks. The restricted grain ration will keep the chicks hungry and they will consume large quantities of buttermilk. If too much grain and mash are fed and the chicks drink large quantities of buttermilk sour crop is very liable to result. There is no danger of this occurring, however, if the amount of grain fed is small." The chicks should be moved to new ground if possible. If not, the ground of the yards should be spaded, and the houses thoroughly cleaned and disinfected. Fresh scratching litter should be spread on the floors daily and swept out and burned every day. Feeding troughs and water fountains are best disinfected with boiling water. After all, prevention is a good deal simpler than curing, and prevention would seem to demand: Clean soil and clean houses and brooders. It is a singular thing that coccidiosis never appears before the chicks are two weeks old, when things begin to get a little dirty; as much room for each chick after two weeks as before; suitable food. Mash is not considered an unsafe food, though it is not given the first week. Beef scrap should not be used the first ten days. It is a good plan to begin with a mixture of bran and rolled oats, and then to gradually add corn meal, beef scrap and other ingredients, but as far as I can learn, the poultrymen who use a commercial mash after the first week do quite as well as those who mix their own. The little chick requires hard grain, mash, greens and grit for grinding them. Just exactly what mixture shall be used is not as important as cleanliness, a chance to exercise, untroubled sleep, in short, the favorable environment which keeps digestion normal.

The cooperative cannery at Modesto opened for the season's run, June 23.

LIVESTOCK

Los Angeles, June 28. — Weighed and delivered off cars without food or water:

Hogs (hard grain fed), 125 to 175 lbs., 9.00; 175 to 225 lbs., 9.50.

Cattle (on foot, gross weight): Steers, good, 8.00@8.50; medium, 7.50@8.00. Cows, good, 6.00@6.50; medium, 5.50@6.00. Calves, 125 to 150 lbs., 9.50; 175 to 225 lbs., 9.00.

Sheep: Ewes, 5.00@5.50; lambs, 8.50@9.00.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock June 28, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Supplies heavy, movement slow, market dull. New Stock: Wide range in prices, mostly 50@60, few best 65, poorer 40 per lug. No. 1, sacked per cwt. wide range in prices, mostly 1.40@1.50. Jobbing: No. 1 sacked per cwt. mostly 1.25.

Onions: Supplies moderate, market firm. Very little good stock on market. Coachella and Imperial Valleys: Standard crates Yellow Bermudas 1.10@1.25, few best 1.50, few fancy Wax 2.00@2.25. Jobbing: Bermudas 1.00, fair condition 85@90.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock June 28, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Asparagus: Market firm; supplies moderate. Local: 16@18 per lb.; Northern mostly 10@12; poorer 6@8; fy. 15.

Beans: Supplies heavy, market weaker. Kentucky Wonder mostly 3½; jobbing 2½@3½.

Beets: Doz., 30@40.

Cabbage: Field crate best mostly 2.25, few 2.50.; poorer 1.75@2.00.

Carrots: Doz., 30@40.

Celery: Supplies moderate, market steady, cr. mostly 6.00@6.50.

Corn: Supplies heavy, market steady, local mostly 1.40@1.50; few fy. 1.75.

Cucumbers: Supplies heavy, movement slow, market weaker. Local: Lugs most-

Lettuce: Local field crate mostly 1.00; few 1.25; poorer 75@90.

Peppers: Supplies moderate; market steady. Imperial Valley: Bells best, 18@20; few, 22@25; poorer 15. Chilis, best 20 per lb.; poorer 15@18.

Radishes: 15 doz.

Rhubarb: Local strawberry, best 90@1.10; poorer 65@75 bx.

Squash: Supplies moderate, market weaker. Summer squash: Local, 25@30 per lug.

Tomatoes: Supplies liberal, market firm. Imperial Valley: Crates 1.50@1.60 for best greens and pinks, poorer 1.25@1.40, fancy ripes 1.65@1.75. Local: Supplies moderate, market steady, crates best 2.00@2.10, lugs 2.50@2.75, fancy 3.00@3.25. Jobbing: Local crates 1.90@2.00, lugs 2.00@2.25, fancy 2.50@3.00.

FRESH FRUITS

Apples: New lb., 4@5.

Apricots: Supplies heavy, market weak, 2½@3 per lb., few fancy 4@4½; poorer 2. Jobbing: 2@3 per lb.

Cantaloupes: Supplies heavy. Demand and movement moderate, market firm on fancy stock, weak on ordinary stock. Ponys mostly 1.75@2.00, standards mostly 2.00@2.50. Jobbing: Standards 1.75@2.00, few fancy 2.25, poorer 1.50, ponys mostly 1.50@1.65, few 1.75, poorer 1.25@1.40.

Cherries: Supplies moderate, market steady. Whites, various varieties mostly 10@12, few 13@15, ordinary 8@9 per lb. Blacks, various varieties 10@12, few fancy 13@14; poorer 8@9; Bings fancy 18@22 per lb. according to quality.

Figs: Supplies light, market stronger. Flats 1.00@1.25.

Grapes: Supplies light, market steady. Per lb. 12@13.

Loganberries: Supplies moderate, market steady; 30 pint crates 2.50@3.00; few 3.25.

Peaches: Supplies increasing; movement slow, market firm. Wide range in quality and condition. Lugs, best 1.50@2.00, poorer 75@1.25; fy. Red Bird 2.00@2.50; various varieties, 5@6 lb.

Plums: Supplies heavy. Movement very slow, market weaker. Santa Rosas, best 6@7, various varieties mostly 5 lb.

Raspberries: Supplies moderate; mostly 2.50@3.00 per 30 pint crate; few fancy 3.25@3.50.

Strawberries: Supplies moderate, movement slow, market weak. Per crate, 30 pints best mostly 3.50@4.00; No. 2 stock, 2.75@3.00.

Watermelons: Supplies liberal, market steady, mostly 2@2½ per lb., poorer 1½@1¾. Jobbing: Klondikes, 40.00@45.00 per ton, other varieties 30.00@35.00.

CITRUS FRUITS

Grapefruit: Supplies liberal, market steady on good stock. Local: per box, market pack 2.00@2.50, special packed brands 3.00@3.25; ordinary 1.75.

Lemons: Supplies moderate, market steady, wide range in prices. Local: packed box 4.50@5.00; few fy. high as 7.00; loose 1.25@1.75 per box; few fy., 2.00@2.25; per lug mostly 50@75.

Oranges: Supplies liberal, market steady. Valencias, best brands, all sizes, 3.50@4.00, few 4.50; ordinary 3.00@3.25; packing house culls 50@75, few best 1.00@1.75 per box.

HONEY

As reported by the Bureau of Markets:

Supplies of White Sage, Light Amber and White Orange light, other varieties heavy. Light wire inquiry. Movement very slow, market dull, little change in prices. Carloads f. o. b. usual terms at loading points: White Orange, new crop 12@12½; old crop, no sales reported. Light Amber Alfalfa, old crop 5½@6, new 6@6½; White Sage best 12@12½; Light Amber Sage, no sales reported. Hawaiian White 6, Light Amber 5½.

Beeswax in less than carlots light 30@33, dark 26@28 per lb. Alfalfa crop is now estimated normal, orange 25 per cent and Sage at 30 per cent of normal.

GRAIN AND FEEDS

Grain Exch. price bid June 28:
Corn: Bulk No. 2, Yellow 1.57½.
Bran: Kansas, 25.00.
Milo: No. 2, bulk, 1.50.
Barley: Carloads, 1.12½.
Kafir: No. 2, bulk, 1.50.

HAY

Alfalfa Growers of California report prevailing prices f. o. b., Los Angeles:

No. 1 Dairy	19.00
Standard	16.00

Shipments of alfalfa hay to the Los Angeles market, to be sold after arrival there, continued to come in quite freely, in fact they formed the bulk of the week's receipts and further depressed prices. Practically all of these lots were shipped by growers not belonging to the association; these shipments consisted mostly of the coarser grades of hay and as they broke the market for these about $5 a ton in two weeks, it needs no further argument to show how very expensive to the growers, aside of selling commission, is unorganized marketing. We want to emphasize again that it is the unorganized growers, principally those in one section of the state, and not the dealers and speculators, who are primarily to blame for this temporary break which has brought prices down to where they net the growers less than half the cost of production. Present total receipts are really not heavier, in fact they are still rather lighter than usual at this time of the year, which is the stocking up period for dealers and users.

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	18.00@26.00
Barley	16.00@24.00
Alfalfa, No. 1 Dairy	18.00
Standard	16.00
Straw	10.00@13.00

San Francisco Markets

San Francisco, June 28, 1921.

Quotations made daily by San Francisco Wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by the wholesalers to producers are eight per cent less.

4	287	20	8.15

Two cars, 19 consignors, $3,289.72.

Total for the week 10 cars, 78 consignors, $12,269.49.

These prices are net to the farmer, while the prices as quoted in the papers, or other markets are f. o. b. the packers' yards.

POTATOES AND ONIONS

Wholesale prices:

Potatoes: Street prices: River, nominal; do, Oregon Burbanks, 2.00@2.25; Nancy Hall, 5.00@6.00 per 100 pounds; Idaho Gems, 2.30@2.60.

New: Garnets, 1.75@2.00 per 100 lbs.

do, White, 1.50@1.75.

Onions: Australian brown, 35@50 per bag; new red, 75@1.00 bag; green, 1.50@1.75.

Garlic: New, 6@8 lb.

VEGETABLES

Wholesale selling price:

Artichokes: Crate, 3.00@12.00.

Asparagus: Culls, 2½@3 per lb.; field run, 4@5; fancy graded, 7@10; green, 3@5.

Beets: 1.75@2.00 per sack.

Beans: String, 3@12.

Celery: New, 8.00@9.00 cr.

Corn: Alameda, 7.00@7.50 per crate of about 9 dozen ears; 5.00@6.00 per sack; Vacaville, 2.00@2.50 per sack.

Cucumbers: 50@90; lug, 2.15.

Eggplant: Lb., 10@12½.

Okra: 8@12½ lb.

Peas: 3@4 lb.

Peppers: Bells, 10@30; Chili, 15@20.

Spinach: Lb., 2@4.

Tomatoes: Imperial, green, 1.00@1.75; ripe, 1.75@2.00; Merced, 1.60; small lug, 2.50. The first large consignment of Stone tomatoes from Merced arrived yesterday, according to advices received by local dealers, who anticipate getting in the neighborhood of $2 for the first shipment. In addition to the large shipments from Merced, the crop movement of "Stones" from Los Angeles will begin the latter part of the week, and dealers are of the opinion that lower prices for tomatoes will prevail this year than did last. They cite for example the fact that the first shipment of tomatoes from Merced last year netted the grower $3 a lug, f. o. b. Merced, in contrast to $1.50 this year.

FRESH FRUITS

Apples: New crop white Astrakhans, 50@75 per small lug; do, reds, 50@75 per lug box; fancy Gravenstein, 75@1.50.

Apricots: 1.00@1.25 per 4-basket crate; 60@1.00 per lug box.

Avocados: California, doz., 3.00@6.00.

Bananas: Lb., 8½@10.

Blackberries: 40@45.

Cantaloupes: Standard, 1.50@2.00; ponies, 1.00@1.50; flats, 50@75; Honey Dew, 1.50@2.00 per crate; flats, 75@1.00; Casabas, 2.50@3.00.

Cherries: Tartarian, bulk, 5@7 per lb., 1.00@1.25 per drawer; Bings, 17½@20 lb.; Santa Cruz, 11@12; Royal Anne, 7@10 per lb., 75@1.25 per drawer.

Currants: 85@1.00 per drawer; 8.00@9.00 per chest.

Figs: Black, 40@65.

Grapes: 3.00@4.00 small lug.

Gooseberries: 7@8 lb.; English, 15 lb.

Loganberries: Red, chest, 7.00; 35 per drawer.

Loquats: 6@7.

Peaches: Cr., 1.00@1.75; lug, 2.00@2.25.

Plums: 1.50@2.00; fy, 2.25.

Raspberries: 75@90 per drawer.

Strawberries: Peninsula and Watsonville, 50@60, some higher; Salinas, 1.10@1.35 per crate; Watsonville, 1.00@1.25 per crate, according to quality.

CITRUS

Navel oranges, 4.00@5.25; Valencias, 3.00@4.00. Lemons, 5.00@7.00 per box; lemonettes, 3.00@4.25; grapefruit, 2.50@4.00.

BEANS

Below California Bean Growers Association shippers prices choice recleaned:

Large Whites	3.75
Small Whites	3.65
Pinks	6.40
Mexican Reds	8.00
Red Kidney	9.75
Henderson Bush	4.50

Corn Meal	45.00@47.00

GRAIN

Wheat: Milling, 2.10@2.20; feed, 2.10@2.20.

Barley: Feed, 1.10@1.25; shipping, 1.20@1.30.

Oats: Red Feed, 1.20@1.30.

Corn: California yellow, 1.55@1.60; white Egyptian, 2.40@2.60 per cental; California red milo, 2.00@2.10; Eastern red milo, 1.95@2.00; Eastern kafir, 1.75@1.80.

Citrus Markets

Los Angeles, June 29, 1921.

Shipments of oranges have been running rather lighter during the past week. This because of the effort to steady up the market a bit which has been running somewhat easier than during the preceding two or three weeks.

Lemons are holding up to very satisfactory prices. The hot streak of the Middle West has shifted to the Atlantic but demand continues strong with limited imports. There are now on hand or available within 30 days 60,000 boxes of foreigns.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 29,079 cars; lemons, 7,447; total, 36,526. To same date last season: Oranges, 23,067; lemons, 5,885; total, 28,952. From Central California to date this season: Oranges, 6,617; lemons, 198; total, 6,815. To same date last season: Oranges 5,370; lemons, 289; total, 5,659. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total 283.

IN THE BILLION CLASS

(Continued from Cover.)

In five states the average value reported per farm was above $25,000. These states were Iowa, $35,616; South Dakota, $33,122; Illinois, $31,270; Nebraska, $29,927; and California, $26,-122.

Average Value Per Acre

The average value of land and buildings per acre in farms in the United States in 1920 was $70.94, as compared with $39.60 in 1910.

An average value of more than $100 per acre was reported for eight states, as follows: Illinois, $231.93; Iowa, $227.09; Indiana, $125.98; Ohio, $113.18; New Jersey, $109.67; Minnesota, $109.23; California, $104.67; and Connecticut, $100.20.

CROP TONNAGE ON COUNTRY ROADS

Eleven principal crops afforded 86,-500,000 tons for hauling on country roads in the yearly average of 1915 to 1919, or 27 tons per 100 acres harvested. Among the results of computations made by the bureau of crop estimates, United States department of agriculture, Illinois is far in the lead of states in providing crop haulage, and its fraction of the United States total is one-tenth, or 8,855,000 tons. Iowa has 6,590,000 tons and Kansas somewhat more than one-half of the Illinois tonnage hauled, with 4,862,000 tons. Following in order are Nebraska, Indiana, Ohio and Texas, with 4,050,000 tons in the last named state. The difference between high and low costs of hauling due to poor or good condition of roads reaches a large figure in the hauling of this great tonnage or a large fraction thereof.

Where is California? Counting up its money, perhaps, for it does not specialize on tonnage so much as quality, or rather, commercial worth. California crops produce the gold.

SHORT STRAW—MUCH GRAIN

Answering Farm Adviser Curtis of Tehama as to the behavior of Mariout barley, Geo. W. Hendry, professor of agronomy, writes:

"I would say that Mariout has a shorter straw than common barley, Tennessee Winter barley or Four Thousand barley and that in dry seasons on dry soils or when spring planted it is frequently very short in its growth. The majority of all the barley in this (Davis) region, however, is now Mariout and very little difficulty is experienced in harvesting it. We have found that growing conditions which result in Mariout straw too short to harvest with the combined will generally result in a complete failure of common barley. Many crops of Mariout in this locality which averaged from six to ten sacks per acre last season stood only about six to eight inches in height at maturity, but by dropping the cutting bar of the harvester until it touched the ground and by attaching strips of rubber automobile tire casing to the reel in such a manner they acted as flaps it was possible to recover without loss barley which stod only six inches in height in the field. This of course was on fairly level ground which was not cloddy.

"Tennessee Winter barley, on the other hand, shows marked superiority to the other varieties on any of the heavy, poorly drained soils under circumstances which would result in drowning out due to the presence of standing water. To get the best results with Tennessee Winter, planting should be done early in the season and not later than January 1. It is at a great disadvantage with other varieties in spring plantings and especially in dry seasons and on dry soils. We do not recommend it except for early fall planting and on heavy, poorly drained soils.

"I am very gratified to learn of the good report upon Four Thousand barley and trust that it will meet with continued success in your locality. It is nothing more than a pure strain of common or coast barley and has no special adaptation such as the wet resistance of Tennessee Winter or the drouth resistance of Mariout. It has been our experience, however, that it is about ten per cent more productive than common barley under all conditions, but is generally exceeded in yield by Mariout on dry soils and by Tennessee Winter on wet soils."

COMING EVENTS

SALT PER CAPITA

About 130 pounds of salt, possibly the weight of Lot's wife, was produced in the United States in 1920 for each person in the country. Of course everyone or anyone of the 106,000,000 inhabitants did not use or eat that much salt, but salt is employed for many other than culinary uses. It is used in packing meat, curing fish, dairying, refrigerating, preserving products from detérioration, making a glaze on pottery, enameling, curing hides, making pickles, and salting live stock, and it is used in some chemical industries, as in preparing soda ash and caustic soda.

According to figures just compiled by the United States Geological Survey, the quantity of salt produced in the United States in 1920 was 6,965,188 short tons, or only slightly less than that produced in the peak year, 1917. The value of the product was $30,539,-168, or nearly $3,500,000 more than in any other year. The average price per ton of all salt sold by the producers in any form rose from $3.93 to $4.38. The average price and total value has increased more than 100 per cent since 1916.

The imports of salt in 1920 amounted to 137,654 short tons and were practically balanced by the exports, which amounted to 139,272 short tons.

FIRE PREVENTION TO BE TAUGHT

Paul G. Redington, district forester of the United States forest service, says that through the signing of Assembly Bill No. 769 and observing of Forest Protection and Fire Prevention Week the state of California has aligned itself with a nation wide drive against the ravages of fire.

Assembly Bill No. 769 provides that each teacher in any public school of the state of California shall devote a reasonable time in each month during which such school is in session to the instruction of the pupils thereof in a course of study and fire prevention comprising ways and means of preventing loss and damage to lives and property through preventable fires.

Last year in California fires destroyed timber, grass and grain worth $983,-562 and burned over approximately 415,275 acres. This bill will go far to provide a remedy for the needless destruction of timber and other resources. Another and very simple remedy may be summed up in the phrase "Help Protect the Forests—Be Careful With Fire." This done, 75 per cent of our forestry problems will be solved.

SALMON PACK CURTAILED

Because of shelves overstocked with high priced 1920 salmon, the canners of British Columbia look for about a 20 per cent pack; some canneries are prepared to put up about 25 per cent of their normal pack, while others are figuring on only 15 per cent. These will all be sockeyes. No "chums" will be canned in British Columbia during 1921, as there are close to three-quarters of a million cases still in stock without a market. In previous years the lower grades of fish shared the overhead expenses of the canneries; this year, there being no lower grades, the sockeyes will carry the entire cost of operation.

Me-o-my, how you'll take to a pipe—and P.A.!

Before you're a day older you want to let the idea slip under your hat that this is the open season to start something with a joy'us jimmy pipe—and Prince Albert!

Because, a pipe packed with P. A. satisfies a man as he was never satisfied before—and keeps him satisfied! Why—P. A.'s flavor and fragrance and coolness and its freedom from bite and parch (cut out by our exclusive patented process) are a revelation to the man who never could get acquainted with a pipe!

Ever roll up a cigarette with Prince Albert? Man, man—but you've got a party coming your way! Talk about a cigarette smoke; we tell you it's a peach!

Prince Albert is sold in toppy red bags, tidy red tins, handsome pound and half pound tin humidors and in the pound crystal glass humidor with sponge moistener top.

Let the SUN give you plenty of HOT WATER

DAY & NIGHT

SEEMS impossible, doesn't it: But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home—mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept. E.

Where Does Our Camphor Come From?

And, we may add, "Where does it (camphor) go to?" It comes mostly from Formosa and may come from almost any humid section where the orange tree will exist. In fact, it may come from a semi-arid section, but probably not with profit. The above specimen stands in Orange County in the city of Orange and is proof of the magnificent growth the tree will make under favorable conditions in California. As a shade tree it is grown largely in California and still more extensively in Florida.

Gum camphor is made by distillation of the wood and even of the leaves of this tree. Japan has now stopped exporting the crude camphor and we are compelled to buy the refined. In 1919 this country imported 2,622,792 pounds of crude and about half that amount of refined.

The gum is used in medicine as a diaphoretic and both stimulant and sedative, but more largely in the manufacture of celluloid.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

It is probable that California will never produce camphor in a large commercial way, yet the tree does sufficiently well in this state to make the photograph which appears on this cover and the facts given with it of considerable interest. The tree is of such slow growth under ordinary rainfall and climatic conditions of this state that unless there is something like the ecualyptus boom of a few years ago or the present effort to make the carob a commercial factor, there will be no general commercial planting. Where the camphor grows naturally there is usually a rainfall of from 100 inches up and humid climatic conditions. However, America needs considerable camphor gum and California can produce it if it is made an object.

* * *

We are assured that the reorganization and bringing together of crop reporting and market bureau forces will give far greater efficiency and be of benefit to producers. One of the latest announcements has to do with a nation wide wireless market news service. We believe it is not yet in operation in California but is from the eastern seaboard to a great number of Middle West market centers. The idea is to make this of value to most remote farms through crop reporting by county farm bureaus. "It is expected that market news will be in the hands of farmers shortly after the close of the markets every business day" and "will help materially to regulate the movement of farm products to meet demand, a condition precedent to stabilization and equalization of prices.

* * *

The International Institute of Agriculture at Rome writes as to supplies of wheat and "arrives at the conclusion that the world stocks are sufficient for all requirements until the new harvest and will leave a margin of 1.4 million metric tons." The world will not go hungry this year and probably not for another twelve month for the institute adds: "It is fortunate that the prospects of a new crop are fairly favorable and indicate a satisfactory yield."

* * *

It is estimated that the United States has one-eighth as much oil in the ground as all the rest of the world and is using four times as much oil as all the rest of the world. An "oil census" is about to be taken by the U. S. geological survey. The work will require nine months' time. Fortunately for Californians the Pacific Coast oil situation is the best of any part of the United States. The object of the census to be taken is to give warning to oil users and secure greater economy in operations.

* * *

Californians who anticipate building campfires must bear in mind that before they are permitted to do so in any one of the ten national forests of California they must secure a permit. There is no charge for the permits and they may be secured from forest rangers or officials in the field or often from merchants and fire agents near the reserves. But even with the permit there is no remitting of the provision that all fires must be extinguished before camper leaves them.

NOT SUFFERING

Eugene Grubb, just back from an observation trip over the East, in referring to financial conditions here and there, says that as one goes east from the Pacific Coast financial conditions become gradually more depressing. Some California producers are unable to see the bright side of things, but the general conditions of the state are vastly better than those of the East. Nor is it entirely due to tourists "doing" the resorts, rather to the putting out of a class of products which the world must have. We won't say the only fly, but we will say the biggest fly, in our ointment is the transporting of these products to market. Fortunately, one great big factor in our transportation is the biggest ocean in the world and the Panama Canal.

FERTILIZERS PAY

The farms of the United States spent during 1919 nearly a third of a billion dollars for fertilizers. This varies from about $9,000, which is spent by the farmers of Nevada, to $52,546,795 which is spent by South Carolina. North Carolina is second with almost as large an expenditure, nearly $49,000,000, while their neighbor, Georgia, is third with over $46,000,000. In fact, the farmers of these three states spend nearly one-half of the fertilizer money of the entire country. The three Pacific states spend which is spent by the farmers of California.

Explanation by the census bureau of the large outlay for fertilizer in the Southern States is found in the character of crops grown, cotton and tobacco being crops which require a great amount of fertilizer.

FARMERS BY RACE

Of California's 117,670 farmers 290 are negroes, 578 Indians, 466 Chinese and 5,152 Japanese; 76,995 are native white farmers, 34,189 are foreign born white farmers. Or, expressed in percentages: Native white, 65.4; foreign born whites, 29.16; colored races, including red, black and brown, 5.5. The increase in the colored races since 1910 was from 3.5 to 5.5 per cent, largely in Japanese. In number of Japanese farmers California is vastly ahead of any other state in the Union, or, rather, all other states in the Union. The states showing the next largest number of Japanese farmers are: Washington, 691; Colorado, 321; Oregon, 224.

DAIRYMEN BEAT WORLD

California dairymen have again shown their ability to produce a superior product. Dean Van Norman, director of the world's dairy congress, writes that at the recent annual meeting of the American Association of Medical Milk Commissioners, held in Boston, California dairymen won first and third on certified milk which was shipped from California to Boston in competition with scores of exhibits from other states.

The Cold Springs Dairy of Pasadena took first, with a score of 99.6, while the Arden Farm Dairy of Los Angeles took third, with a score of 99.4. Dean Van Norman states that these scores would be remarkable if the contest had been held in California, but to ship across the continent and get such scores certainly reflects rare credit on the character of work being done on these certified milk farms.

Nor is this the first time, for California dairymen have repeatedly shipped fresh, unpasteurized milk thousands of miles across the desert and proved winners. It costs money to produce clean 100 per cent pure milk. California has it—and spends it.

CORDIALLY RECEIVED

The Farmers Weekly, published in South Africa, reports the sending of a commission of wool producers to German manufacturers to dispose of some of the South African surplus. The African wool growers received most cordial reception in Germany but went home without any contract for: "We have come to the conclusion that the government is, no doubt with the cooperation of the banks, keeping the industrial development of the country back as far as possible just now so as not to give the appearance to the outside world that Germany can or could pay a large indemnity, and we therefore think it is quite possible that the mark is artificially kept at its present depreciated figure for obvious reasons. In other words, we think that directly the indemnity question is finally settled the country will be allowed to develop on natural lines, and we venture to think that it will quickly improve despite its present very great difficulties, always provided that nothing unforeseen arises, such as internal or external far reaching troubles. It is illustrative of the present policy of Germany, in our opinion, that they do not publish, as has always been and is the case with all other countries, the returns of their imports or their exports, and neither will they allow any inquirers to get any idea as to what these figures are."

ENJOY BUT DON'T DESTROY

The mountains from Monterey to the Mexican border are covered with "waxen tapers which increase in height as the white bells climb the slender shafts. Each cluster reaches its perfection and becomes a solid distaff of two—yes, even six—thousand of the waxen blossoms. These grand white soldiers with their hundred swords * * * surpass all known species in the height and beauty of flower and panicles." We said "covered," which is hardly correct, for these wonderful yuccas, or Spanish bayonets, appear at rare enough intervals to glisten purest white against the deep green of the hillsides.

The reason for referring to these flowers of wonderful beauty is not that we may quote the charming poetical expression of another, but to call attention to the more practical suggestion that we may preserve some of these California flowers. It is hardly probable that they will ever disappear for their habit of growth takes them to the most inaccessible of locations where even the most greedy of humans may not reach them, but, so far as they can, they go forth in automobiles, laden with hatchets and saws and carry by the thousands these beautiful flowers to destruction. We have seen great spikes tied to the sides of autos, and occasionally these are so tall that in passing under a low shade tree or other overhanging object the spikes have been broken at the tip and the 30 or 40 mile speed has enabled the wind to whip to pieces the mass of flowers. The spikes of wonderful bloom arrive in the city—where they do not belong—with little of beauty left.

There is as yet no "Save the Yucca" organization, but we may at least pass on the word and urge a bit of consideration for these flowers. Fortunately the California yucca is better located for preservation than the California poppy. The poppies prefer the plains, where automobilists go by the thousands and carry away literally loads of flowers and seed possibilities. Those gathering the flowers seem to feel that they may only possess them by clutching in their hands or entirely uprooting. These beautiful things are "going to waste" if the observer looks and leaves them for some one else to see.

They are apparently inspired by the same feeling as that of an Easterner who arrived in the fall as the Golden Glow was in its glory. She secured a cottage alongside of which was a great bed of them and asked permission to cut them for bouquets. While the flowers were directly alongside the cottage she was told: "Surely, gather all you wish." And she wished many, for she cut them by the armful. She cut without any idea of preserving the beauty which should have remained with the garden for many weeks. She threw her arms around all she could possibly reach and then with the shears left only mutilated stubs. Where one or two or at most a dozen of the blossom stalks would have made a glory in the room she massed them by hundreds in tubs and pails and revelled in them because for the first time in her life she had cut all she wanted to. Her idea of possession was in having in her "own hands."

In these days when our hills afford so much of beauty we may well conduct a campaign of education for our Easterners and—we must regrettfully add—some of our Californians, in this matter of preserving our own natural beauties.

California Cultivator

Vol. LVII, No. 2 | Los Angeles, July 9, 1921 | One Dollar Yearly

A New Cover Crop

MUCH interest is being displayed in the California trials of a new "annual white sweet clover" discovered in the greenhouses of the agricultural experiment station at Ames, Iowa, and later proven to be native to Alabama, perhaps to adjoining states. However, this new form seems to be a mutant or sport. It has been tried on the Pacific Coast at various points and the roots have lived through the past winter and made new tops. It is doubtless biennial, perhaps triennial. Farm Advisor Hodgson of Los Angeles County says he has placed it in about ten different localities and that it is growing vigorously at each station. The Iowa state college says of it:

A Giant Hubam Plant Five Months From Seeding

This plant has been a great success in Iowa and has adapted itself satisfactorily to California conditions.

"The new Hubam clover has surpassed all previous records in the many tests made with it during the past year. When the Iowa station first announced the discovery of this clover in 1916 it was with the statement that it had made the remarkable growth of 4½ feet in 3½ months from seeding, while medium red clover and common sweet clover grown in comparison and under exactly the same conditions measured 5 inches and 14 inches respectively. Many tests, from Maryland to Oregon, showed growths of from 6 to 8 feet in 1918, while the past season the clover grew 9 feet high in 3½ months, or just twice the growth first reported by the Iowa station. Growths of from 7 to 10 feet have been reported from nearly every state and from many foreign countries.

"A seeding of Hubam made in New York on June 1 of last year measured exactly 108 inches (9 feet) in 103 days (3 months and 16 days) from planting. This clover made a total growth of 10 feet and matured seed before the end of the season. Many carefully measured 10 foot growths were reported from widely different parts of the country.

"While we may not want a 10 foot clover for hay, and hogs might have some difficulty in getting the tender topmost leaves, the vigor of the growths reported gives some idea of the possibilities of the plant for green manure, pasture and honey production. Grown under crowded field conditions the clover makes a much finer growth and may furnish two cuttings of hay or an abundance of highly nutritious pasture for such animals as cattle, horses or sheep.

"But the remarkably rapid and vigorous growth made by this clover is only one of the many interesting demonstrations of the year. When seeded with small grain at Ames it produced six times the growth of medium red and mammoth clover and three times that of the biennial white sweet clover, following the removal of the small grain crop. When seeded broadcast on a weedy and poorly prepared seedbed the last of May it overcame the weeds, made a growth of 5½ to 7 feet and matured a seed crop.

"The drouth resistant qualities of the clover are reported from several states as remarkable. In one instance, without irrigation and with less than one inch of rainfall after the clover was seeded, it grew to a height of 7 feet and showed no ill effect of the drouth when all other vegetation perished in the worst drouth experienced since 1882.

"The growth when carefully measured has often averaged over 1½ inches per day, with a maximum under greenhouse conditions of 2½ inches in 15 hours.

"Its heavy seed setting character is indicated by seed spikes which have measured 20 inches in length. Planted in rows 3 feet apart the seed yields have averaged 5 to 8 bushels per acre, while with closely spaced growths the yield has run over 10 bushels per acre of clean, scarified seed.

"While Hubam clover has gained many friends the past year, the most uniformly enthusiastic group of men are the bee keepers. The most widely read and oldest bee journal in the United States carried extensive discussions of its merits, with many illustrations, in eight of the twelve issues of the year 1920."

Citrus Culture in Texas

By W. R. Wood

ALONG the Gulf coast of Texas from the Louisiana line south to the Rio Grande River is a strip of territory in which numerous attempts have been made to grow citrus fruits. Around Port Arthur, and south of Houston a few miles, there were at one time quite extensive plantings of Satsuma oranges, but one or two cold winters, together with a very bad infestation of citrus canker, practically wiped out the industry in these sections. Further south in Brooks County there was quite a planting of oranges, and I was told that at one time there was an annual production of 25 or 30 carloads of oranges from one locality, but the citrus canker also invaded this section, and when the writer was there two years ago there remained only a few acres of bearing orchards.

South of this section, in what is known as the Lower Rio Grande Valley, there has been considerable activity during the past ten years, particularly in the planting of pomelos. The Lower Rio Grande Valley is bounded on the east by the Gulf of Mexico, on the south and west by the Rio Grande River, and on the north by a strip of low sand dunes, and contains something over 600,000 acres of irrigable land. Several thousand acres of this valley is now being irrigated from the Rio Grande, and if the present movement is carried out, it is expected that by means of storage reserviors farther north sufficient water will be available to irrigate the entire valley. The soil ranges from a light sandy loam to a very heavy silt, some of it being in the nature of adobe, but it is all very rich and when properly irrigated produces wonderful crops of cotton, corn and vegetables. Citrus trees also make a remarkable growth and at three years of age they are fully as large as our average five year old trees here in California. This is due not only to the richness of the soil but to the long growing season. The winters are usually mild and the trees do not stop growing during the winter months. As an illustration, the writer saw nursery stock that had been budded in October, which with us would remain dormant until spring, in which the buds were two to two and one-half feet high and calipered three-eighths to one-half inch the first of February. This winter growth is what makes citrus culture hazardous, as the amount of cold necessary to damage a growing tree is much less than when the trees stop growing and harden up in the fall, and people not acquainted with this fact wonder why trees in Texas do not stand as much cold as they do in California. The cold snaps in this section come quite suddenly and are usually of short duration. Oftentimes there are just one or two nights during a winter that the temperature goes down to the danger point and the balance of the winter, both day and night, is as pleasant as our spring and summer weather here.

Of all the citrus stock planted in this valley, fully 90 per cent are pomelos, as they seem to do better than oranges or lemons and the fruit is decidedly superior to anything grown in California. The sizes are larger, with a very thin skin, and the flesh tender and very juicy, with an excellent flavor. They ripen early, about the same as in Florida, and will therefore never come in competition with California pomelos, especially if we hold our fruit until it is ripe and fit to eat. Oranges of the Florida type do very well and are very prolific, but I have been told that they do not carry well. This is possibly due to their being too ripe at the time they are shipped. The Washington Navel does not do well, the tree being somewhat shy in bearing and the fruit large and very coarse. The Valencia is somewhat better but does not reach the perfection that it attains here in California. There are very few lemons growing in the valley, but the few there are seem to produce a good quality of fruit and blossom and set fruit throughout the year.

It is rather difficult to estimate the acreage of citrus fruits in this valley as it is scattered over an area some 30 or 40 miles long, by 10 to 20 miles in width, the bulk of the planting being in small tracts of from one to ten acres, with an occasional planting of 40 to 100 acres. Very few of the older plantings remain, as little or no protection was given them, and they have gradually been killed out by frost. During the last four or five years, however, more attention has been given to the trees planted, and at the present time there are some very nice young groves that will produce considerable fruit this season.

The principal farm crops of this valley are cotton, corn, potatoes and winter vegetables, and up until the last two or three years citrus culture has been a side issue with most of the farmers, as a consequence of which very few of the plantings have received proper care and attention. In spite of this it is remarkable to note how well the trees have done, and had proper winter protection been given them there would be a large acreage of full bearing trees at the present time.

The past two winters have been very mild, with little or no frost, and the orchards look better now than at any time the writer has visited the valley.

On my last trip I had occasion to visit the Raymondville section, which is in the northern end of the valley and about 20 miles from the Gulf coast. Up to the present time this territory has never been under irrigation, although artesian wells are available at a depth of 1,200 feet, and, I understand, furnish a very good supply of water. There are a number of citrus orchards here that have not been irrigated excepting when first planted, and they look remarkably well. The moisture from the rains is conserved by constant cultivation, a practice that is not followed in the sections where irrigating water is available.

The average rainfall in the valley is 26 inches, most of which comes in the spring and summer, there being very little rain during the fall and early winter. The summer temperature ranges from 85 to 110 degrees, and the nights are usually warm although there is nearly always a rather stiff breeze which makes the heat less noticeable.

The country is being rapidly settled up by farmers from the Middle West and North who are anxious to get

(Continued on Page 47.)

Agricultural News Notes of the Pacific Coast

Northern California

Milk at 12 cents a quart is promised Alameda County.

State fair, Sacramento, September 3-11. The premium list has been issued.

Eldorado County farm bureau will hold its annual picnic July 23 at Eldorado.

The State Automobile Association has been sign posting roads in Butte County.

Arbuckle, Colusa County, will hold its almond festival September 28 to October 2.

The forest service has granted permits for eight municipal camps in this state.

Pleasanton, Alameda County, has begun working to secure the county fair for the fall of 1922.

It is expected that the state highway from Chico to Los Molinos will soon be thrown open to travel.

Dairyville, Tehama County, has organized a pig club. The first regular monthly meeting was held July 5.

The Pacific Rice Growers Association is before the railroad commission asking the same rate on rice that is given to grain.

Fifty per cent of the pear growers in the Auburn district of Placer County have signed up with the Pear Growers Association.

Donnieville, Sierra County, reports peculiar streakiness of frost damage in cherry orchards, some spots showing all fruit killed while nearby trees are loaded.

Committees of farmers and the Colusa County chamber of commerce have been formulating plans for handling the rise of the water table from rice irrigation.

A travel conference to study spray residue on pears in Sacramento County was recently conducted by Horticultural Commissioner Brosius. Fifteen state, county and federal officials attended.

Horticultural Commissioner Shoup of Shasta County estimates the peach crop at an average for the uplands, but in the lowlands, where there was some frost, at 50 or 60 per cent of normal.

It has been proposed to form drainage districts in rice growing sections of Butte County to meet complaints brought by non-rice growing property owners against drainage of waste water into canals of Sutter Basin.

President Sheehan of the Grape Growers Exchange reports an increase in price of grapes of from five to 20 dollars per ton. This increase is due primarily to the shortage caused by late frosts. Some of the prices are: Zinfandels and similar grapes, $70; Alicante Bouschet and high colored juice grapes, $90 per ton.

Farmers of Placer County met in Auburn last week and adopted the following wage schedule: Unskilled labor, 35 cents per hour; packing cherries, 20 cents straight box and single faced lug; packing cherries, 25 cents double faced lug; packing plums, 6 cents per crate; packing wrapped plums, 6 cents per box; packing lugs, 6 cents per box, graded; packing peaches, 2½ cents per box; packing pears, 6 cents per box; packing grapes, 5 cents per box, cleared.

Central California

A new $15,000 fig preserving plant is being built at Sultana.

Ripon district of San Joaquin County is raising big crop of melons.

Modesto milk distributors began delivering 12 cents a quart milk July 1.

Japanese of Fresno County will test the constitutionality of the alien tax law.

A Fresno grape grower reports sale of 20 carloads of Zinfandels at $82.50 per ton.

The Madera Fruit Growers Association expects soon to start shipping green grapes East.

The Monterey County farm bureau held a big picnic and barbecue at Alisal Park. June 23.

The new Los Banos creamery of the Associated Dairymen of San Francisco is practically completed.

Visalia canneries plan not to run on apricots. The fruit in that section will be shipped to Hanford.

Cantaloupe shippers and growers of the Turlock section will generally conform to standardization rules.

Wheat harvesting in the Oakdale section of Stanislaus County shows good yield; barley very spotted.

The first whale of the season, a humpback, was brought into Moss Landing, Monterey County, last week.

Five carloads of dried peaches left Porterville last week for Philadelphia by way of San Francisco and Panama Canal.

The new five cent raisin package put out by the California Associated Raisin Company has met very favorable reception.

The first shipment of cantaloupes in the Turlock section went out July 1. Carload shipments will not begin until after The Fourth.

The last shipments of Valencia oranges have left the Lindsay district. Apricots and plums are now being shipped to Chicago.

A carload of fresh figs was shipped East from Fresno, June 23. Half the carload was auctioned in Chicago, the other half in New York.

The San Joaquin Milk Producers Association is securing signatures to its credit-member agreement and will soon hold election of new board of directors.

The Tulare supervisors have decided to continue the work of squirrel control and to furnish Horticultural Commissioner Collins with additional inspectors.

According to D. F. Collins, horticultural commissioner of Tulare County, that county will have a light olive crop this year because of heavy rainfall during May which destroyed the blossoms.

Horticultural Commissioner Rutherford of Stanislaus County says that prospects for the cantaloupe crop this year are above the average, although the acreage planted is something less than last year.

Something over 30 sections in the Tulare Lake grain fields are reported as having a good stand of grain, about evenly divided between barley and wheat. One field alone consists of 12 square miles without a fence or break in the grain.

Southern California

Apricot growers report contracts made at from $30 to $70 per ton.

Ventura farmers are discussing breaking into the cabbage growing game.

Chaffee junior college is conducting a summer school of agriculture for teachers.

Julian, San Diego County, reports about a half crop of apples as a result of the freeze.

Great plans are being made for the San Fernando Valley fair to be held September 13-18.

A conference of citrus fruit shippers is to be held this week to discuss continental freight rates.

Yorba Linda, Orange County, is becoming one of the greatest avocado producing sections of the Southwest.

Harvesters are busy in the grain fields of the Calipatria section. Ranchers are securing average price of 90 cents.

Several Los Angeles milk distributors have been indicted by the grand jury because of alleged violation of the Cartwright act.

The last meeting of the Garden Grove, Orange County, farm bureau was addressed by Poultry Expert Easson of the university farm.

Blackeye bean growers of Orange County are forming a marketing pool which is expected to include most of the growers in the county.

Imperial Valley papers are urging Imperial and San Diego Counties to cooperate in maintaining the Mountain Springs grade in better condition for travel.

Lemon men are pleased at present price situation but realize the improvement is only temporary and are still discussing restoration of the industry to stable basis.

The Brawley farm bureau has appointed committee to draw up constitution and by-laws of a farmers exchange which will handle veal calves, hogs, hay and grain.

Southern California lovers of the beautiful are appealing for preservation of the yuccas now in full bloom on all the mountain sides. Automobile parties have made a habit of destroying them by the thousands.

The high record herd for May in the Imperial Valley cow testing association is the property of R. G. Cleghorn of Holtville, whose 20 cows averaged 945.7 pounds milk and 38.6 pounds butterfat per cow for 30 days.

The first annual grape growers conference in the Imperial Valley was held June 29. Many of the vineyards in the valley were visited and experts were present from the state university and department of agriculture.

The California Lima Bean Growers Association, in a recent advice, says that "the 1920 crop is not yet all sold but near enough to know that the distribution to local associations on regular Limas will be over $5 and under $5.50 per cwt."

L. J. Weishaar of the state standardization service recently left Brawley with an east bound shipment of seven cars of cantaloupes. He will conduct a minute investigation of temperatures at stated intervals, re-icing records and the quality of the stock on arrival at New York.

The Coast and General

The apple growing district of Southern Idaho this year shipped out 2,244 carloads of fruit.

The Wenatchee Valley of Washington shipped in 1919-20, 10,396 carloads of apples; in 1920-21, 8,162.

A new cow testing organization has been organized at Tempe, Arizona, with more than 600 cows signed up.

The Oregon Growers Cooperative Association will dispose of its apples and pears in the Rogue River section through the Stewart Fruit Company.

Gooseberry producers of Oregon are spraying with Bordeaux to prevent anthracnose. The gooseberry crop will run this year about 6,000 pounds per acre.

The proposition is being considered by the civic organizations and business interests of the Salt River Valley to carry out a $200,000 advertising campaign.

A preliminary reconnoissance survey of the Colorado River and vicinity is being made by Harry Blake under the direction of W. S. Norveil, state water commissioner of Arizona.

The condensed milk plant which recently reopened at Tempe, Arizona, is putting out 15,000 cans of milk daily. There is said to be a market for at least twice this amount at the present time.

Lieut. Alexander Pearson recently made an aeroplane flight over the Grand Canyon and succeeded in making a landing in the canyon. He is making a study of the air currents of the canyon.

The apple season in the Pacific Northwest shows shipment of 28,000 carloads up to March 1, 1921. This is 9,000 cars less than last year at same date. Winesaps made up 36 per cent of the shipment.

There is much talk in the Northwest of reviving the apple show at Spokane which was for years an annual feature. It is suggested that it be held in turn at Portland, Tacoma, Seattle and Spokane.

Grain growers of the Salt River Valley have organized as a subsidiary of the farm bureau. It is expected that through the organization growers will receive at least 35 cents a hundred more for their wheat than was offered before the organization.

Previous to the war prunes were grown in Bosnia and Serbia to about the same extent as in California. Most of the packing houses and many of the orchards were demolished, but last year the crop was a good one and 50,000 tons of dried prunes were produced.

The new state law of Arizona requiring all real estate dealers to take out a state license is now in effect. Clarence Woodbury, former secretary of the Maricopa County Realty Board, has been appointed state real estate commissioner. This is handled through the office of the state land commission.

The board of supervisors of Maricopa County, Arizona, are recommending to the state board of equalization the reduction of 25 per cent on the valuation of irrigated lands and 20 per cent on the valuation of city lots. Also a reduction of valuation of range cattle, poultry, dairy cows, sheep and swine.

A Fragment

THE Cultivator recently referred to the death of James De Camp and to the fact that he had been connected with the Cultivator for the past two or three years. At the time of his death he was just beginning an article on California highways and the proper protection of them, especially in the particular of their misuse by overloaded trucks. One of the large trucks, with weight of load and truck of ten tons or more and making on a level or a slight down grade an easy 20 miles an hour, gives terrific hammer blows from its solid rubber tires, and this has been definitely shown to have a most serious effect upon highways made on even heavier base than is now possible. It is with extreme regret that we give only this fragment of Mr. De Camp's work and wish that he could have finished the article with other facts that he was gathering to show that we should give more consideration to our highways.

* * *

By James De Camp

There was once a man of my acquaintance who climbed far out upon a husky tree limb and carefully sawed it off between himself and the trunk. The spectacle of this witless woodsman hurtling himself earthward toward the hospital is scarcely less comical than that of the California truck owner wailing to high heaven about the expense of highway building and maintenance while his grossly overloaded caravans thunder from Mexico to Oregon.

It is a fact that one-eighth of the trucks on California highways today are overloaded to some extent, most of them seriously enough to damage the road surface in the localities they traverse. It is also a fact that in the greater part of the state little or no effort is being made by the authorities to enforce those provisions of the California motor vehicle act which specify a penalty for the overloading of trucks.

Before any of the measures now being considered for adjusting license fees, taxing gasoline, etc., are settled upon to help finance extension and maintenance, would it not be well for the law abiding seven-eighths of California's truck owners to insist that the weight hog be summoned to an accounting and required to show a proper respect for public property? If a person should throw a brick through one of the windows of the state capitol he would be rushed to the calaboose with more speed than style. Yet another may load down a truck with double the weight the law allows and proceed to hammer the daylights out of an expensive highway surface to his heart's content.

Section 15, paragraph C of the motor vehicle act fixes the maximum load permissible at 800 pounds upon any inch width of tire. In speaking of enforcement the act says "The supervisors of any county, etc. . . ." In several districts local and county authorities are enforcing this provision carefully, but throughout the major portion of the state a truck operator is permitted to haul whatever his motor can pull.

The California State Automobile Association (representing the northern part of the state) and the Automobile Club of Southern California recently conducted a joint investigation into the overloading of motor trucks. During a period of four months 2,000 trucks were weighed in various districts. Of this number 256 were found to be overloaded to various degrees, some carrying as much as 100 per cent overload.

The truck owner who believes he is beating the game by overloading will ultimately be in the same predicament as the man who went to sleep with his wooden leg in the fire. In addition to running up city, county and state road taxes for himself and his neighbors he is shortening the life of his truck equipment and boosting repair bills.

San Joaquin Grape Growers for New Markets

By Arthur L. Dahl

THE dried grape has made Fresno the raisin capital of the world, and one who remembers the old town of ten years ago will never cease to marvel if he again visits the new city built almost entirely with raisin money. There was money in grapes in the old days when wineries bid against other markets for the luscious clusters from the vines, and there still is money in grapes in these dry days, for new markets are opening to the growers, and even some of the closed wineries are again opening their doors and the wine presses are busy with more legitimate objects in view.

The making of fresh grapes into raisins is one of the most effective ways devised by man for preserving the fruit of the vine, and the cooperative efforts of the raisin people have taught the whole world to appreciate California raisins, but all grapes cannot be converted into table raisins, and it is for this class of products that the most concern has been felt, for ordinarily the wineries would have absorbed these grapes at a price that would return a fair margin of profit to the grower. Certain varieties of black grapes were grown almost entirely for wine making purposes, while a considerable part of each season's crop of raisin grapes was found suitable only for crushing, so that the advent of prohibition affected nearly all grape growers to a more or less extent.

In a talk recently with a man prominently identified with the grape industry, some very interesting information was secured as to the plans of the grape growers for marketing their crops not found suitable for raisins. According to Ed Harper, president of the Golden State Products Company, which company operates a big plant at Kingsburg and is a large buyer of fresh grapes, a number of avenues are open to grape growers for disposing of their crops. To begin with there will probably be this year, as in the last two seasons, a big Eastern demand for fresh grapes, and this demand includes all varieties. Last season thousands of crates, barrels and boxes of fresh grapes were shipped to various parts of the country to be used for pressing into home made beverages by the Latin people accustomed to their daily portion of wine, and unless it is held that shipment of fresh grapes for pressing purposes is unlawful, the market this year will be even bigger than usual. This pertains exclusively to those varieties of grapes not ordinarily classed as table grapes, and shipped east in cork or redwood sawdust for sale to the family trade. There is always a steady and fairly large market for such eating grapes, and prohibition has not affected it one way or another.

Mr. Harper further reports that thousands of tons of fresh grapes will be crushed and the juice made into grape syrup, which will insure another market for the growers. Last season several concerns, including the Golden State people, put out considerable quantities of bottled grape syrup which was extensively advertised as a new table product, for use on hot cakes, in making soft drinks, etc. So well did this product go that the big plant at Kingsburg is being enlarged to handle double the quantity of grapes this season, and it is possible that one or more additional plants will be opened up in the San Joaquin Valley to manufacture grape syrup. For this purpose the old winery buildings and equipment serve admirably, with some necessary changes and additions, for the crushing of the grapes and the handling of the juice in the preliminary stages are identical for grape syrup and wine. For making syrup, however, large vacuum boiling pans are required, where the fresh juice is divested of its surplus water, and the necessary bottling equipment is needed, where the product is prepared for the market. To keep the fresh juice from fermenting or spoiling until it can be run through the vacuum pans, the Golden State plant has installed a series of huge reservoir tanks, in which refrigerating coils are installed, so that the contents of each tank can be kept at a given temperature indefinitely. This solves the most important problem connected with the conversion of fresh grape juice into syrup. Since the grape harvest extends over a period of but a few weeks, and the commercial plants must necessarily crush the grapes faster than the juice can be boiled, it was necessary to devise some means of preserving the fresh juice, and the cold storage was the result. Now, by maintaining sufficient storage, a grape syrup plant can operate over a period of many months, drawing on the cold storage tanks for the fresh grape juice required to keep the vacuum pans going, and as a result such plants as the one at Kingsburg can run long after the grape season is ended, giving employment to hundreds of men and women.

One of the plans that is being worked out by Harper and his associates is to pool the interests of the grower, manufacturer and distrbutor so that all will work for the advantage of all. This is done by having the growers adjacent to a syrup factory become stockholders in said plant and deliver to it a certain percentage of the grape crop from their vineyards. Likewise, fruit brokers and distributors in various parts of the country are taken in as stockholders, in consideration of which they are given the exclusive agency in their territory for all the products of the factory. Many of these brokers already have the facilities for handling fresh fruit, and they will solcit orders for fresh grapes, for eating or crushing purposes, and these orders will be wired to the California plant and filled from the fresh stock of grapes offered daily. By this means it is expected that the same plant can make shipment of fresh grapes in boxes or crates, or if this market is not available, the grapes can be crushed and made into syrup or bottled as grape juice. The grower will benefit in two ways, first by having an assured market for his grapes, and next by partiicpating in the profits of all sales made by the plant in which he is a stockholder. The eastern brokers likewise profit from the commissions earned on shipments of fresh fruit and bottled syrup or juice handled by them, and by owning stock in the manufacturing unit, they will participate in the profits of the concern. Mr. Harper stated that so keen was the competition amongst eastern distributing firms that one concern alone, in Chicago, offered to take all the allotment made to dealers, but it was thought best to distribute the stock among a number in different parts of the country to assure a more permanent success.

That California grape growers feel assured of a successful future for their industry is shown by the high prices asked for bearing vineyards, and the additional acreage that is being planted to vines. The grape area in the San Joaquin Valley is gradually creeping farther south, and many vineyards in Kern and Kings Counties are vying with those of Fresno County for first honors, and in the northern part of the state, in Sonoma County and other vineyard districts, sales of grape holdings are at fancy prices, and contracts for the 1921 crop of grapes are being made at profitable figures for the growers, and many of them refuse to sign up at all, planning to dry or otherwise handle their own production when harvest time comes.

FRESH FRUIT, ESPECIALLY IN HOT WEATHER

Fresh fruit furnishes a valuable part of the meal, stimulates the jaded appetite, cools, refreshes and is easily assimilated. Especially in hot weather fresh fruit is doubly welcome at meal time.

Grapes, for instance, contain blood building constituents such as sugar, potash, salts, phosphoric acid, lime and iron. Apples and pears contain phosphates, lime, albumen, and malic acid, and act as gentle laxatives. Cherries and plums furnish phosphates, sugar and nitrogen. Berries are good tonics for their acids and salts of lime and iron. Oranges are blood makers and laxatives. Melons are largely water in combination with sugar and starch. Lemon juice taken regularly is a valuable laxative with a pronounced beneficial effect on torpid livers. In children's diets oranges, berries or acid fruits should not be given along with milk. Continued use of fresh fruits will promote intestinal activity and reduce acidity of the blood. Fruit has ceased to be a luxury. Even at higher prices for standard grades it is a wise and excellent investment.

Spray Now---Delay Is Costly

From a large grower and packer we have received the following letter:—

"Replying to your inquiry regarding our experience with Citrospray will say that we welcome this opportunity of telling you of the splendid results we have had both in controlling the scale and cleaning up the fungus with which the trees were infested.

"The fruit from the trees sprayed with Citrospray was of excellent quality, and arrived in the eastern markets without decay, bringing the top prices for fruit from this district.

"We did not get all of our orchards sprayed last year, and we figure that on one orchard of 12 acres our loss this year will be at least $5,000.00 on account of not being able to spray it. We won't let this occur again, however.

"Wishing you continued success in your good work, we are, etc."

Seedling Avocado Orchard

By Ernest Braunton

IN company with County Farm Adviser Hodgson and K. A. Ryerson, assistant state leader of agricultural clubs for the coast counties, the writer visited several avocado orchards ranging from Azusa in Los Angeles County to Yorba Linda in Orange County. All but one were planted to budded varieties; one five acre orchard was planted to seedlings of varied type and uncertain parentage.

The owner of this land had been a cook in a prominent Los Angeles hotel. In that capacity he had been able to secure all the seeds that came to the hostelry. The fruits were doubtless unnamed sorts from Florida, the West Indies, Central America, Mexico, Hawaii, South Sea Islands, and a few were, perhaps, Californians, for this happened 11 years ago. Today the orchard is a study, an avocado museum. Every type of tree is present. Some are tall, columnar, others spreading and drooping, with every transitional form. Foliage runs from the pale green of the West Indian to the deepest green possible. Some leaves are small, some large, some thick, some thin. Smooth leaves scarcely veined are on one tree, on the next may be a rough, deeply channeled leaf. In no orchard in California is the range of gross aspect or detail of parts greater.

At least 25 per cent of the trees have fruited and the fruits are as variable in appearance as the trees and their leaves. As to palatability, the writer is at present eating the different types of fruits as they become ripe and therefore has nothing to say just yet. Suffice it to say that in the entire orchard the fruit of no tree appear good enough to name and perpetuate. Had these trees come from seeds of good named varieties the per cent of desirable fruits would probably have been greater. Yet even this we do not know. But based on the experience of many years of study and plant breeding, we opine such selection should have been productive of better results. No doubt it would pay the owner of this orchard to top-work every tree. This treatment would not deprive him of an income from the second grade fruits now being sold. The transition from old top to new may be so graduated as not to imperil the corpulency of the pocketbook. We shall watch closely this orchard and report further.

The Silent Homestead

EXCEPT for song of bird and ripple of waterfall the homestead is silent, the voice of the maker will never return; for this fine country home near Glendora, Los Angeles County, was the property of the late Charles Silent, a pioneer settler of Los Angeles. Since the death of the owner no one but caretakers are there, the gates are locked and large signs proclaim "Closed to the Public."

Two members of the Cultivator staff, with G. P. Rixford, physiologist, United States bureau of plant industry, recently visited this noted foothill country place and found easy entrance. The public are excluded only because some of them do not seem to be aware that the property was not designed for them to prey upon at will. Not alone flowers, but oranges, avocados and other tropical fruits have been ruthlessly stripped from the trees, the latter sometimes being broken down by vandals climbing far for the last unlawful prize in the form of a ripe avocado, cherimoya or sapote.

The place is one of surpassing loveliness. One hilltop has been flattened to a level greensward, supported by terrace walls of Glendora purplish brownstone, the crest enclosed by noble specimens of the beautiful Cocos plumosa palms. At one end is an "outdoor" rustic dining pavilion, and at the rear a number of tiny palm thatched cottages, each containing living room, sleeping room and bath. About these buildings grow begonias, fuchsias and other decorative flowering plants in almost tropical luxuriance, thriving as they seldom do at lower altitudes. Over the buildings and arbors clamber such rare plants as the Copa de Oro, or Cup of Gold (Solandra guttata of the botanist), the huge golden chalices as large as teacups and quite similar in form. With this species is also growing one having large bell shaped flowers of white, Solandra grandiflora. All about are palms, bamboos, glens filled with ferns of many species, hillsides covered with flowering yuccas, the whole scene one of unusual garden splendor, cared for as in the days when the plant loving owner lavished his affections upon each favored subject. For out of the wilderness Judge Silent wrought much of this loveliness with his own hands.

Stone enclosed roadways wind about the 400 acres, skirted on either side by subtropical fruit trees. There is nearly a mile of avocados marking the roadway's course through the more somber orange groves, and a majority of these seem to be of the Dickinson variety, now loaded with ripening purple fruits. On one main road the avocados are alternated first by a white sapote (Casimiroa edulis), and next by the Queensland nut (Macadamia ternifolia), both now in fruits about half grown. Feijoas and other guavas, carissas, cherimoyas, and a considerable variety of tropical fruiting shrubs complete the border plantation about this beautiful building site from which may be seen the mountains in the background, the broad, orchard covered valley in front, and beyond the round topped San Jose hills that divide it from the Pomona Valley on the other side. To the east the view is extensive toward San Bernardino and westward toward Los Angeles and the sea.

FRESH FIGS SHIPPED EAST THE FIRST WEEK IN JUNE

For the first time in the history of the fruit shipping industry fresh figs in carload lots are being supplied to American markets from California.

The failure in the past to successfully ship fresh figs has prevented the markets of the East from securing any great quantity of a fruit that is considered in a class by itself by epicures. In California where the problem of getting the fresh fig to the market in good condition is simplified, it is one of the most popular fresh fruits sold and demand has invariably been greater than supply. The revival of fig planting of recent years has increased the supply to a point where the fresh fig is available for Eastern shipment.

Officials of the United States department of agriculture state that not one-tenth of one per cent of the American people ever saw a fresh fig, say nothing of ever having eaten one. As the supply increases yearly the shipments will be extended to the principal markets of the East. The first will be distributed from New York and Chicago.

The decision to ship fresh figs is the result of a growing demand in Eastern cities. In order to carry out the project successfully four concerns active in the fig industry have combined for the purpose of getting the shipment through in the best condition possible.

The orchards selected to contribute the first carload of fresh figs were the Everett Goodale Black Mission orchard at Farmersville and the Scott and Forkner Fig Gardens at Fresno. The figs were picked at dawn by a trained crew from the J. C. Forkner Fig Gardens and pre-cooled in the early morning hours. The California Peach and Fig Growers supervised the packing and furnished boxes. The car was supplied and prepared by the Earl Fruit

UNITED STATES TIRE
USCO TREAD
Here is the U. S. Usco Tread, with a long-established standard of service among motorists who have an eye to value, as well as to price. While selling for less than the other tires in the U. S. Fabric line, the Usco has earned a reputation for quality and dependable economy which is not exceeded by any tire in its class.

Why are so many tires sold at big discounts? How old are they? Who made them? Who is responsible to *you* in seeing your investment is protected?

Go to a legitimate dealer and get a United States Tire. A *fresh, live* tire with all its original service and vitality. Back of your tire investment stands the U. S. reputation, the U. S. quality policy, the U. S. out-in-the-open methods of doing business.

This way you get *economy*. You know who you're trading with. And in the end you have nothing to charge up to experience but a credit of your own *satisfaction* and proof of your own *good judgment*.

Reclaiming Gophered Trees

By Ernest Braunton

FARM Adviser Hodgson of Los Angeles County has been holding a series of 12 demonstrations of inarching gophered orange trees. The work is done by planting close to the afflicted tree from three to five sour seedling oranges two years of age, usually about a half inch caliper. These are cut off and the top of the stubby trunk shoved up under the bark of the old tree, as near the ground as possible.

If gophered trees are small it is better to dig them out and replace with young trees. If of such size as to make them of decided value over a young newly planted tree, and the condition is not bad, it will pay to inarch with three trees. Older trees require four, and in very large ones it is better to use five, seedlings. Holes are dug around the gophered tree and

Two Inarched Seedlings

These may be told by the black "patches" of waxed-over cloth at the unions. Also note the gopher eaten zone below.

the young seedlings cut off to about a foot of stem or trunk. The cut is a slanting one of about one and one-half inches from heel to toe. This slanting cut is placed against the wood of the tree under the bark. An inverted T cut is used and the stem is shoved well up under the bark. When in place a small nail less than an inch long is used to nail the flat cut surface firmly against the sapwood of the tree. The earth is then placed about the roots of the seedling and all is ready for the finishing touches.

The cut is well waxed while the wax is warm. A shield or patch of waxed cloth large enough to cover the entire wound is placed and the whole again waxed. This gives a good protective covering that will last as long as protection is necessary. Soil is then piled up high enough to cover the union and is left there for about a month. This keeps the wound cool and moist, conditions ideal for uniting or knitting together the tissues. Action is set up in a few days and trees soon begin to show deeper color and increased vigor. This work should be done as quickly as possible after injury is done and for that reason orchardists should thoroughly inspect their trees each spring for trees attacked. Some orchards are free, but of those afflicted the per cent of gophered trees has been determined to run from five to 50.

The trees used by Mr. Hodgson were presented to him for this work by R. M. Teague of San Dimas, and when the latter was asked their value he said balled trees are worth 20 cents each and bare root trees 15 cents. Mr. Hodgson says bare roots are best because lightest and most convenient to carry about. A good man will treat from 15 to 20 trees a day and experts are now in the field who charge $1.50 per hour for their labor, so the cost per tree is easily determined. This method of rejuvenation will save badly injured trees whose value is too great to be sacrificed by neglect until they perish, or else linger for some years before again returning a profitable crop.

TEN POINTS ON PRUNING FIG TREES

By I. J. Condit

The pruning of fig trees depends upon the variety and the method of harvesting the crop.

Trees grown for fresh fig production such as the Kadota are headed low by heavy annual cutting back.

Trees grown for dried fruit are headed at about 16 inches and from three to five main branches selected for the framework of the tree.

Most fig trees bear two crops, the first crop on the old wood, the second or main crop on the new wood of the present season's growth.

Young Calimyrna and Kadota trees have a tendency to produce long, upright branches without laterals. Heading back early in the growing season or during the winter induces branching and prevents the branches from becoming top heavy.

Adriatic and Mission trees naturally produce laterals on the main branches. Cutting away low lying and interfering branches constitutes the principal pruning of these varieties.

Low headed trees are as a rule most vigorous. Long exposed trunks are very subject to sunburn and should be avoided.

Summer pruning seems to be advisable with Calimyrna trees early in the season to induce branching, and with other varieties simply to remove useless branches and suckers from the base.

The pruning of bearing trees consists in thinning out old wood to encourage new growth, in cutting back long branches to induce laterals, and in removing branches which interfere with cultivation.

Caprifig trees are pruned simply for shaping and for economical harvesting of the crop.

APPLES, PEACHES AND PEARS IN THE UNITED STATES

The condition of apples throughout the United States is 41.8 per cent of a normal, indicating a total crop of 107,698,000 bushels. A crop of 240,442,000 bushels was harvested last year when the condition was 79.3 per cent on June 1. The commercial crop (that part of the crop boxed and barreled) is estimated to be about 16,592,000 barrels or 49,776,000 bushels.

The production of peaches is estimated at 31,769,000 bushels on a condition of 45.5. Last year on June 1 the condition was 64.9 and a crop of 43,697,000 bushels was harvested.

Pears are only 43.8 per cent of a normal crop, indicating a production of 8,899,000 bushels. A crop of 17,279,000 bushels was harvested last year when the condition was 73.4 on June 1.

KEEPING CHERRIES FRESH

The preservation of cherries in fresh condition for one year by a new cold storage process has been practically demonstrated by experiments recently completed at the University of California by E. L. Overholser, W. V. Cruess and S. A. Bjarnson. Fresh cherries were retained frozen in dilute sugar solutions, with their original color, flavor and appearance unchanged.

The new method offers promise as a profitable means of keeping cherries for pies, pastries, soda fountain use, and for serving fresh in hotels and restaurants. With the low prices being received during the present season for fresh cherries, this method can be profitably utilized in the disposition of the cherry crop.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sand Cherry

Can you tell me where I can get seed of the Western sand cherry (Prunus pumila Besseyi), also Prunus pumila which grows about five feet tall in the wild state in the East? These are used for dwarfing stock for plum, peach, etc. Is the Rocky Mountain cherry one of these and what can you tell us of each?—Subscriber, San Jose.

We have been able to find no one who has the seeds or knows where they may be obtained. Prunus Besseyi is the western sand cherry and the original of the "Improved Rocky Mountain Cherry," now a fruit tree of commerce. It is a distinct species (from P. pumila), of prostrate habit, four to five feet high. Prunus pumila is known as sand cherry, grows five to eight feet high, with a small valueless fruit, whereas Prunus Besseyi has an edible fruit of some size. The geopraphical range of the two species is somewhat different.

Beans as Pigeon Feed

How do Garbanzo beans compare with peas as feed for pigeons? When is the proper time to start them? Do they yield as heavy a crop as peas? What are proper methods of growing? —Subscriber, Modesto.

This is a question which we will pass on to practical pigeon feeders. We can find no analysis of the Garbanzo but take it that it is very similar to the common field pea. Beans and peas run very close together as to analysis except that soy beans, peanuts and similar legumes run far richer in both protein and fat. Soy beans run over 14 per cent fat while some beans like teparies have only eight-tenths of one per cent and common field or garden peas run around 19 to 21 per cent crude protein.

Leaf Cutter Bee

Am sending leaves of a climbing rose. It is covered with leaves like the enclosed, showing little circular pieces cut out. Please tell me what is causing the condition and what is the cure?—Subscriber, McFarland.

This is the work of the leaf cutter bee, Megachile. Comstock says: "The bees of the genus Megachile have the curious habit of making cells for their young out of neatly cut pieces of leaves. These cells are packed away in such secure places that one does not often find them; but it is a very easy thing to find fragments of leaves from which the pieces have been cut by bees. The leaves of various plants are used for this purpose, but rose leaves are used more frequently than any other kind. The bee is a carpenter as well as a leaf cutter. It first makes a tunnel in wood, often selecting that which is partially decayed; then it proceeds to build a thimble shaped tube at the bottom of this tunnel. For this purpose it cuts from the leaves oblong pieces, each of which forms a part of a side and the bottom of the thimble shaped tube. When the tube is completed, the bee partially fills it with a paste of pollen and nectar, and then places an egg upon the supply of food. She then cuts several circular pieces of leaves, the diameter of which is a little greater than the diameter of the tube, and forces them into the open end of it, thus making a tightly fitting plug. Usually several cells of this kind are placed end to end in a burrow; and sometimes many bees will build their nests near together in the same piece of wood. The leaf cutter bees do not always bore tunnels in which to place their cells. We have found these cells in a crack between shingles on a roof, in the cavity of a large branch of sumach, beneath stones lying on the ground, and in Florida in the tubular leaves of a pitcher plant. Some species of bees make nests similar to those of the leaf cutter bees, except that the cells are formed of pieces of petals of flowers. The petals of Pelargonium are often used for this purpose."

While this pest is perplexing during time of its most severe attack it is hardly worth going to the expense of treatment.

Watermelon Blight

Is there any commercial fertilizer that will keep wireworms away from melons? I have noticed several of the long runners on my watermelon vines have wilted and dried up with apparently no cause. On some I noticed a small place where a little sap came out and dried. Can you solve the mystery and give a remedy? — Subscriber, Norwalk.

This is probably the common wilt or blight affecting melons, cucumbers and pumpkins. It is a bacterial disease carried from plant to plant by the twelve spotted beetle or other leaf eating insects. The first step is to destroy the insects by spraying with an arsenical spray. This should be followed by the removal and burning of the affected vines.

To Purify Water

What is the best way to purify water? We have a dug well 40 feet deep in which the water has stood for seven years without using. I have emptied the water out and let it fill up again and want to find out how to make it fit for drinking purposes.—Subscriber, Valley Center.

We think the pumping out and filling with pure fresh water should be sufficient. However, if there should be any decaying vegetable matter that should be carefully removed, and if one wishes to be doubly sure he may use sulphate of copper in the water, thoroughly agitating it and allowing it to remain a few hours, after which the water should be carefully pumped out and the new pure water which will fill should be perfectly safe to use. Where sulphate of copper is put into the water which is expected to be used for drinking or cooking purposes it may safely be used at the rate of one ounce of the chemical to 30,000 gallons of water. Presumably the application in the well which may be pumped out might be of much greater strength.

Moles

You are able to help others so I am sure you can tell us what to do to rid our fruit ranch of moles.—Subscriber, Loomis.

The only way to eradicate moles is by the use of a regular mole trap. We think all seed and plant stores carry these. The trap consists of two sets of jaws separated six or seven inches. To set the trap press down lightly the raised runway, then press the jaws down either side so that the trigger of the trap comes just above the pressed down runway. When the mole comes back through the same runway he naturally lifts the dirt, releasing the trap, and he is caught no matter which way he is coming from. The poisoning of moles is not practical for their diet consists of live grubs, worms and insects. They seldom molest the roots of plants or vegetable matter and by many are considered beneficial in orchard. Of course in lawn or in flower beds they are an insufferable nuisance and trapping becomes necessary.

Ant and Fly Poisons

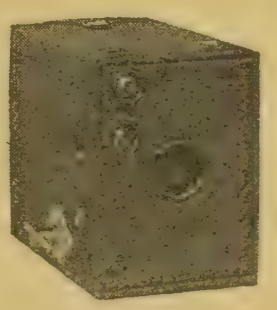
I would like to know a good paste or poison for flies and ants as we are

Enlarged from a negative made with a

Two Dollar BROWNIE

THE BROWNIE CAMERAS of the box type are the simplest of all cameras to load and to use. But what is even more important, they are well made and carefully inspected, have good lenses and make *good pictures.*

THE No. 0 BROWNIE makes pictures 1⅝ x 2½ inches. It has an excellent meniscus lens, a shutter for snap-shots or time exposures, has two finders and is handsomely finished. Kodak film cartridges for 8 exposures to fit this Brownie are but twenty-five cents. In every detail a practical little camera. Inexpensive to buy and inexpensive to use.



The No. 0 Brownie.
The Price, $2.00, includes the excise war tax.

Ask your dealer or write us for a catalogue of Kodaks and Brownies.

EASTMAN KODAK CO., ROCHESTER, N.Y.

being overrun with them this year. At the state fair last year there were signs "Use Germo for flies" in the sheds where the stock was kept, but I've been unable to find out where to get it. Any information concerning flies and ants would be welcome.—Subscriber, Stockton.

There are many very satisfactory ant poisons, fly poisons, sticky fly paper and fly repellents. Nearly all drug stores and seed and plant stores carry them. The ant poison comes in the form of pastes or liquids and often with the container comes small vessel for placing them in an attractive way before the pests. In addition with ants by tracing back the procession which they often form to their nests one may secure quicker action by destroying the whole bunch by pouring boiling water, gasoline, sulphate of copper solution or almost innumerable other destroyers into the hole. With flies common fly poisons or fly traps usually are satisfactory. Like the ants, however, begin at the source: Keep all manure in fly-tight bins or distribute and put under the soil so as to remove breeding places. Closet vaults and outhouses should be screened and kept fly tight. Besides the fly repellents put up commercially and sold as above suggested one may use the following spray to keep flies from cattle: 4½ quarts coal tar dip, 4½ quarts fish oil, 3 quarts coal oil, 3 quarts whale oil, 1½ quarts oil of tar. Dissolve three pounds laundry soap in water, add the ingredients of the spray and bring the whole up to 30 gallons with lukewarm soft water. This spray will keep off the flies and prevent the coats of the animals from becoming harsh. The cows should be sprayed twice a day, in the morning after milking, and in the afternoon when in the barn for silage or green feed.

Tanning a Rabbit Skin

Would you be kind enough to print an article in the Cultivator on tanning rabbit skins. I have several beautiful rabbits and would like to know if a person could tan them at home so that they would be suitable to be made into caps? Or would it be more satisfactory to send them to a real tannery? Also would like to know where I could buy a very good book on rabbit breeding.—Subscriber, Camarillo.

"The Rabbit Book" by Washburn suggests that one desiring to tan skins may "either use a commercial tanning compound of which there are one or two on the market which give good results, or he can, at less expense, make his own tanning fluid. In any case the treatment of the skin with the fluid is but a small part of the work involved in producing a soft, white hide, for while the skin is drying it has to be pulled and twisted, stretched and rubbed until quite dry and soft; this takes time and energy. The rubbing can be done over the edge of a board, the fur being protected by folding the skin. The fat or any flesh adhering has been removed before immersing in tanning fluid. If the fur is greasy the skin can, when partly dried, be immersed in a good grade of gasoline for about an hour, then wrung dry and dried with cornmeal or fine sawdust. The United States department of agriculture publishes the following recipe for a tanning liquid: To one gallon of water add one quart of salt and one-half ounce of sulphuric acid. Immerse thin skins for one day and heavy skins longer, but any skin may remain in the liquid indefinitely without harm. Remove, wash several times in soapy water (after this it should be rinsed thoroughly in warm, clean water), wring dry, then rub on flesh side with cake of hard soap, fold lengthwise, hair side out, and hang over line to dry. When barely dry, scrape (to remove any remaining fat and the tissue between muscle and hide, which, if left on, tends to harden and stiffen the skin), then stretch, rub, and twist until dry. Animal fat or butter may be worked in when warm, then worked out with hardwood sawdust. A dried pelt should be soaked in warm water for an hour before being placed in the tanning liquid."

"The Rabbit Book" by Washburn is published by the J. B. Lippincott Co., Philadelphia, at $2 net. Another book is "Practical Rabbit Keeping" by George Townsend, published by Cassell & Co., New York.

Trellising Raspberries

I set out a number of raspberry plants this spring which are growing vigorously. They now have shoots ranging from four to six feet long, which are one-half inch in diameter where they commence and taper down to about one-fourth inch. May I cut these shoots to a desirable length or must I train them up on a lattice fence? We have already had a few berries from them this year.—Subscriber, Orange.

If one wishes he may stake up raspberries, although with the red variety its canes are usually stout enough to take care of themselves. This is helped by pinching off tips and thus preventing excessive length and inducing fruit bearing branches. Blackberries and logans are usually trellised.

Government Whitewash

Will you please give me directions for making government whitewash for use on the outside of buildings.—Subscriber, Van Nuys.

An old time recipe for whitewash issued by the lighthouse board of the treasury department and often called "government whitewash," is as follows: Slake half a bushel of unslaked lime with boiling water, keeping it covered during the process. Strain it and add a peck of salt, dissolved in warm water; three pounds of ground rice put in boiling water and boiled to a thin paste; half a pound of powdered Spanish whiting and a pound of clear glue dissolved in warm water. Mix these well together and let the mixture stand for several days. Keep the wash thus prepared in a kettle or portable furnace, and when used, put it on as hot as possible with painter's or whitewash brushes. The washes which contain milk, flour or glue are not to be advised for use in damp, interior places, owing to danger of decomposition of the organic matter. For such locations it is better to use one of the formulae containing none of such ingredients. Whitewash is applied with a broad whitewash brush and is spread lightly over the surface, no attempt being made to brush it in as is the case with an oil paint.

Another formula recommended by a Sacramento painter, which will not rub off, especially when applied to smooth surfaces: Whitewash requires some kind of grease in it to make it most durable. Any kind of grease, even though it be old and partly soiled, will be all right, though tallow is best. The grease imparts to the whitewash an oil property the same as in good paint. To a 40 gallon barrel, say, of whitewash thinned ready to use, have incorporated in it ten pounds of tallow or any grease, mix in lime in the slacking stage, also ten pounds salt. In order to incorporate the grease properly it is necessary to put it in a vessel on the stove and boil it into a part of the whitewash so as to emulsify and get it into such condition that it can be properly incorporated with the whitewash mixture.

Another "lighthouse whitewash" is: (1) 62 pounds (one bushel) quicklime, slaked with 12 gallons of hot water; (2) 12 pounds rock salt, dissolved in six gallons of boiling water; (3) 6 pounds Portland cement. Pour (2) into (1) and then add (3). Alum added to a lime whitewash prevents it rubbing off. An ounce to the gallon is sufficient. Flour paste answers the same purpose, but needs zinc sulphate as a preservative. Molasses renders the lime more soluble and causes it to penetrate the wood or plaster surface; a pint of molasses to five gallons of whitewash is sufficient. Silicate of soda solution (about 35 degrees Baume) in the proportion of one to ten of whitewash produces a fireproof cement. A pound of cheap bar soap dissolved in a gallon of boiling water and added to about five gallons of thick whitewash will give it a gloss like oil paint.

Spray for Citricola

What is the proper amount of lime-sulphur to mix with 100 gallons of water in spraying for citricola scale? Also, when is the best time for spraying, and if I spray twice, when I should do it?—Subscriber, Highland.

As a rule fumigation has been preferred for the control of this pest. J. A. Prizer, in his address before the California Citrus Institute, stated that among the best spray remedies was the lime-sulphur solution in combina-

UTILITY TRAILERS

Ranching or farming today is a serious business. It calls for keen, intelligent judgment and the application of every economy to the work in hand.

¶ ¶ ¶ ¶

A large economy can be practiced through the use of a Trailer. Their initial cost is remarkably low—the saving usually great.

CHEAPEST HEAT YOU CAN BUY

The Sievert Oil Burner burns either distillate or kerosene oil in cook stoves, heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

Requesting your local merchant to stock articles advertised in the California Cultivator helps your town, the advertiser and the Cultivator.

tion with oil and glue, four gallons of commercial lime-sulphur to one and one-fourth gallons of miscible oil. Citricola should be sprayed or fumigated at once or by the middle of July, if possible. Of course, great care should be used in spraying.

Controlling Grasshoppers

Please send me formula for making poison bait for grasshoppers. Is there any other way of conbating them?—Subscriber, Delano.

The poison formula recommended by the state department of agriculture is: Paris green (or white arsenic), 1 pound; molasses (cheap black strap), 2 quarts; lemons (ground very fine), 6; water, 4 gallons; wheat bran (or alfalfa meal), 25 pounds. Add molasses, poison and ground lemons to water first. Stir thoroughly, then slowly pour this solution over bran and stir until an even mixture is secured. Spread the wet poison bran mixture very finely by hand from a bucket or with an end gate grain seeder attached on rear of wagon. This is sufficient to cover 4 or 5 acres. In orchards and cultivated fields spread poison in forenoon; on alfalfa and grassland in the heat of the day and before cutting the crop. Keep livestock away from bags containing poison mixture. Fall plowing and breaking up of soils where they lay their eggs is beneficial; also they are sometimes controlled, where they are a serious pest, by use of hopperdozer, a long scraper-like contrivance drawn by two horses, with trough containing coil into which the hoppers are supposed to hop. This has not proved a very practical means of control and its use has not extended.

Leaf Eaters

Enclosed please find leaves from plumcot and walnut trees. They are perforated and are rapidly falling. Would you advise cause and remedy?—Subscriber, Shafter.

This plumcot leaf has been injured by leaf cutter, or one of the leaf eaters. There are many of these, such as the rose chafer, May beetle, leaf cutter bee and others. Their work is not sufficiently damaging to justify campaign of control, and we presume before this time they have disappeared. The walnut leaf appears to be affected by some fungus, but specimen is too dry to determine. If the trouble still appears serious larger and fresher specimens may be sent and we will submit to an expert.

Experiment Station Addresses

Will you kindly tell me the location of the agricultural experiment stations in South Carolina, Florida, Alabama, Mississippi, Missouri and Tennessee? I believe the most helpful department of the Cultivator is your "Answers to Questions."—Subscriber, Arcadia.

The agricultural experiment station of South Carolina is located at Clemson College P. O.; the Florida station, Gainsville; Alabama, Auburn; Mississippi, Agricultural College P. O.; Missouri, Columbia; Tennessee, Knoxville.

Resetting Strawberries

I planted about an acre to strawberries last fall and the ground not being level I am having a hard time to get water to the plants. Would it have any effect on the berry crop if I should dig the plants in August and set them back in ground within a few days? What is the best way to plant them?—Subscriber, Sacramento.

If the soil is of sufficiently firm texture it is very possible that these plants could be dug, those that are in hollows raised with leveling done by shovels and those that are on the higher points lowered and thus continue growing and even bear a crop. That would call for great care, however. If the field is so uneven that the entire surface has to be cleared in order to do a complete job of leveling, then we would prefer to wait until the dormant period, preferably in December.

Salting Hay

I am going to stack and salt my oat hay this season and would like to know what quantity of salt to use per ton.—Subscriber, Chino.

Regarding salting hay Henry's "Feeds and Feeding" says: "Salt and lime scattered over hay when put into the mow tend to prevent fermentation and check the growth of molds. Salt also renders it more palatable. These materials are not essential, but are helpful, especially when storing partially cured hay during bad weather." We will ask any subscriber who has had experience in salting hay to give suggestions as to the amount per ton. It would surely be a very few pounds and we presume would be a matter of judgment.

Orange Trees Run Down

I have 14 acres oranges and two acres do not do well. Trees are three to four years old on sandy soil and small for their age. I give them plenty of water once a month. Fertilized a year ago with bean straw and barnyard manure; again this year with barnyard manure; also had a good cover crop of Melilotus Indica. Trees seem to leaf out well, then leaves gradually drop off and trees are always full of dead twigs. Most of the time they are about half defoliated. What's the matter with them and what can I do to get them normal? These trees are in front part of place and look bad. The soil gets heavier towards back of place.—Subscriber, Buena Park.

This is a matter for study of the particular problem. The falling leaves indicate that at least periodically the tree or the soil is in bad condition. It would be well to give a general overhauling such as pruning out the dead material, irrigating so that water reaches to the lower depths and in sufficient quantity that the tree does not dry before the next irrigation. Again, there may be a serious infestation of scale. This is a serious drain on the vitality of the trees and might cause the appearance indicated. Late in the fall thorough and deep plowing might correct soil conditions and make next season's work more satisfactory. The tree, like the human, is liable to so many ills that a correct diagnosis, which can only be had by personal contact, is the first step.

Zante Currant

Is the Zante currant a hardy vine in a hot climate? Do the vines have to be staked like a seedless vine? How far apart should they be planted?—Subscriber, Guinda.

See page 393 of the California Cultivator of September 25, 1920, for extended article and cultural directions on the Zante currant which does well in the San Joaquin Valley. That article is illustrated with photographs of the vine showing method of pruning and calling attention to the success which the vine has had in that valley. The article is written by Fred K. Howard.

Bush Fruits

I wish to get some Cory thornless blackberries, thornless gooseberries, barberries and currants. Will you please inform we where I can get them and the best time to plant?—Subscriber, Reedley.

We think any of the nurserymen advertising in the Cultivator can supply vines of the Cory thornless at the next planting season which will be in December or January when vines are dormant. As to thornless gooseberries and currants we will pass the question on to our subscribers though we take it ordinary gooseberries may be had of nursery people in the neighborhood of Greenfield, Monterey County, and in the coast counties north of San Francisco where they are also grown. Of course the most common variety of gooseberries is the Downing, often termed the American gooseberry. As to barberries, many eastern states make it a misdemeanor to harbor this pest which encourages the rust. Usually the fruit is not considered of sufficient value to justify any general planting.

THE CARELESS SMOKER

(Apologies to Kipling.)

A fool there was and his pipe he lit
(Even as you and I)
On a forest trail where the leaves were fit
To become albaze from the smallest bit
Of spark—and the fool he furnished it—

The forest burned to its very roots,
Even beneath the ground,
With the flowers, the birds and the poor dumb brutes,
Old hoary oaks, and the tender shoots
Which might have made logs but for such galoots
Allowed to wander round.

The lumber jack has now passed on
His pay day comes no more
And the screech owls haunt the camp at dawn
Where the cook's tin pan woke the men of brawn,
But the mill is silent, the trees are gone,
The soil and the forest floor.

A deadly sight are those hills of rocks
Which once were beds of green.
No hope for the human, no food for the flocks,
The floods must be held by expensive locks
And the harbor is silted to the docks,
The ships no more are seen.

But the fool smokes on in the forest still,
Leaves camp fires burning, too.
While the patient public pays the bill
And the nation's wealth is destroyed for nil—
If the law doesn't get him, Old Satan will,
When his smoking days are through.
—Harris A. Reynolds, in "The Open Road."

ELSIE

By Margaret Condon

(Continued from last week.)

Thus it was decided. As soon as Donald could find a tenant for the ranch they would leave for the East.

"What do you think, Donald," she exclaimed excitedly, "My cousin, Janet Harris, is coming to spend a day and a night with us on her way East. I told you she was visiting friends in San Francisco. She is returning by the southern route so that she may see us. Isn't it great, Donald?" and Elsie's eyes were shining with joy.

"It's jolly good news, Elsie," Donald returned heartily. "When will she come?"

"Tomorrow on the early train. We must drive into town to met her."

Donald assented, and Elsie, all her troubles forgotten for the time, began preparations for her guest.

Mrs. Harris, Elsie's Cousin Janet, was on friendly terms with Donald long before their small roadster had covered the distance from the railroad station to their home.

"You see, Donald," she said in her frank, kindly manner, "I am years older than Elsie and privileged to scold her if she deserves it. Why are you so quiet, Elsie? I expected you would have wonderful stories to tell me of your life in California," and her clear eyes rested inquiringly on the girl's flushed face.

Elsie was spared the necessity of replying as at that moment Donald turned the car into the driveway that led to the house and the joyous welcoming bark of Teddy greeted them.

Janet Harris was out of the car almost before it had stopped and caressingly patting the collie's head as Donald said cordially:

"Welcome to Oakglen Ranch, Cousin Janet."

"Oakglen," she repeated. "An appropriate name for your beautiful place." Then glancing about keenly, "I see from what it is named; those wonderful live-oak trees, and it is a glen in the foothills, isn't it?"

Donald smilingly assented, while Elsie maintained her quiet demeanor, and Janet's lively flow of conversation went on.

"Roses, roses!" was her exclaimation, as she caught sight of the pergola. "Red and white, and pink and creamy! Oh, glorious, glorious! How do you manage it in the dry season?" as she turned to Donald.

But it was Elsie who answered brightly:

"Donald loves the roses—and so do I," she added slyly, stealing a glance at Donald. "He takes especial care of them, and they know it, so they respond. You should have seen our pergola after the rains, Janet. Just covered with masses of fragrant bloom. It was wonderful."

Donald smiled, his eyes on the girl, and her face colored hotly as she read his thoughts.

"No, I don't want to go into the house yet," came Janet's lively voice, as Donald started up the steps. "I have only this one day, remember, and I must see everything on the place."

And so, luncheon forgotten for the time, they wandered over Donald's broad acres, and although the crops were harvested and the land sere and brown, awaiting the autumn rains, Janet found new wonders at every turn. The great live oaks and sycamores, the fringe of tall, pungently odorous eucalyptus trees that sheltered the ranch from the sea breeze, the birds flitting among the trees, the wealth of bloom and shrub, all appealed to this appreciative Eastern visitor.

Finally they turned their footsteps toward the house and Janet said earnestly:

"I congratulate you, Donald. I love it all, and I'm sure Elsie must be very happy here. A lovely home and a devoted husband," she added archly, glancing at Donald. "What more could a girl ask?"

Donald flushing hotly under his bronzed skin, turned his gaze upon Elsie but said nothing. Loyally he was standing by his girl wife, leaving it to her to tell her cousin what she chose.

To Elsie the situation was embarrassing and her thoughts perplexing. In the face of Janet's appreciation of their home and surroundings how was she to confess that the ranch was to be given up at her insistence? How reveal her lack of interest in all that Donald cared for? She had looked forward to receiving Janet's sympathy in her homesickness, but that was impossible now. A twinge of remorse seized Elsie as she thought of Donald's goodness and of all that he was sacrificing for her. All through that bright September day a still small voice was whispering to the girl, "Janet is right. You have a lovely home. You are selfish." Then came thoughts of her old home and dear ones so far away, and the small prompter was silenced.

The hours of their brief day with Janet sped quickly and evening found them gathered on the veranda.

Janet glanced at the collie where he lay at Elsie's feet.

"Contentment personified," she said. "How Teddy would miss you if you left him. I think, Donald, if you and Elsie make a trip East any time in the near future you will have to bring the collie. You couldn't bring your roses and your mockingbirds, but you could bring Teddy."

Elsie stooped to caress the dog as Donald returned whimsically

"O no. We could never take Teddy on a long journey, and then he's a 'native son.' He would not like the ice and snow of New England. We'd leave him with Pedro."

Elsie's eyes met Donald's with a peculiar look and his heart beats quickened. "If only," he thought, "Elsie would see things as Janet sees them," when an exclamation from Janet drew their attention.

"Look!" she said. "How beautiful the night is!"

The stars had come out and in the clear atmosphere they sparkled like jewels set in a deep blue background that seemed tonight very close to them. A red gold crescent moon was mounting over the Verdugo hills, lying dark and deep in the distance. The night was warm and the light breeze wafted to them from the mountains the fragrance of wild growing things.

(Continued next week.)

HINTS FROM HOUSEKEEPERS

Quince Preserve

Peel ripe quinces and cut in squares the size of cube sugar. Pour boiling water on them and boil five minutes. Pour off water, put in a little boiling water and cook until done, add sugar to taste and cook five minutes. Then you will have the finest pale pink colored preserves you ever saw or ate. It has been thought that quinces were worthless except for jelly, but they make the finest tasting preserves of any fruit that grows. This recipe, with an explanation under it, printed in J. E. Bergthöldt's cook book of all kinds

The Cultivator Patterns

3302-3610. Ladies' Costume.—Waist 3302 cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3610 cut in six sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. To make the dress for a medium size will require 3¼ yards of 27 inch material for drapery, collar and cuffs and 5½ yards for short sleeves and waist. The width of the skirt is two yards at the foot. Two separate patterns, 10 cents for each pattern.

3602. Girl's Dress.—Cut in four sizes: 2, 4, 6 and 8 years. A 4 year size will require 2½ yards of 36 inch material. Price 10 cents.

3603. A Charming Negligee.—Cut in four sizes: small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size will require 5⅝ yards of 44 inch material. Price 10 cents.

3593. Junior Dress.—Cut in three sizes: 12, 14 and 16 years. A 14 year size will require 3¾ yards of 38 inch material. Price 10 cents.

3389. A Simple Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 5⅝ yards of 40 inch material. The width of the skirt at the foot is about 1⅞ yards. Price 10 cents.

3291. Child's Dress.—Cut in four sizes: 2, 4, 6 and 8 years. A 4 year size will require 2⅜ yards of 36 inch material. Price 10 cents.

3596. Ladies' Apron.—Cut in four sizes: small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size will require 4¼ yards of 36 inch material. Price 10 cents.

2418. Play or Work Uniform for Boys.—Cut in five sizes: 4, 6, 8, 10 and 12 years. Size 10 will require 4 yards of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best **NEW YORK** styles, all patterns ordered are filled in **NEW YORK.** Therefore, we promise to deliver all patterns ordered within **TWO WEEKS;** we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT
California Cultivator
Los Angeles

of fruit, circulated through the United States, would advertise the quinces in such a way that it would be almost impossible for many years to supply the demand.—O. H. Mack, Reno, Nevada.

Peanut Taffy—Nut Crisp

In your issue of June 25 you ask for a recipe for a peanut taffy. Here is one which has been in our family for years: 2 cups molasses, 1 cup brown sugar, 1 tablespoon butter, 1 tablespoon vinegar. When the candy threads pour it over peanuts in buttered tins.

Here is another recipe which makes delicious candy:

Nut Crisp.—Butter a pan about 8 by 12 inches and cover with coarsely cut nut meats, raisins, fig and citron. Boil two cups sugar and ½ cup water to soft ball, add 1 teaspoon vanilla and pour over the hot nuts. When perfectly cool mark off in sections.—Mrs. Clara Kommers Hall, Waterford.

Peanut Taffy—Cream Rice Pudding

Peanut Molasses Taffy, such as we made at home in New England when I was a little girl: 2 cups molasses (light), 1 cup sugar, 2 tablespoons butter, 1 tablespoon vinegar, pinch of salt (unless butter is quite salty), 2 cups shelled peanuts. We made it in an iron kettle with a round bottom. Put butter in first and when melted add molasses and sugar. Stir until sugar is dissolved. When nearly cooked should be stirred constantly as it burns very easily. Boil until brittle in cold water. Add vinegar just before taking out, also peanuts. Pour into well buttered pan about one-half inch deep.

Cream Rice Pudding with Honey.—One quart milk, 2 tablespoons rice, ¼ cup honey, ½ teaspoon salt. Pour into buttered pudding dish and bake very slowly for three hours. Stir several times the first hour. If you wish it very sweet use one-third cup honey. Add a little flavoring if you wish, but honey has a flavor of its own.—Mrs. R. P. Dickson, Porterville.

HOUSEHOLD QUERIES

Sweet Pickles—Mixed Pickles

I would like some one to publish through your columns a recipe for making cucumber pickles that will be of good color and crisp when taken from jar or bottle (I prefer the sweet pickle); also one for mixed pickle.—Subscriber, Modesto.

Sweet Pickles.—To 500 small cucumbers allow 3 quarts cider vinegar, 7 ounces mixed pickle spice (or 2 ounces each cinnamon, allspice, cloves and a few small peppers), 3 pounds sugar, light brown or white. Let cucumbers stand in salt water overnight. Put cucumbers together with spices and sugar into cold vinegar. Heat and boil two or three minutes. Pack tightly in jars, fill with boiling vinegar and seal. If vinegar is too strong a quart of water may be added.

Mixed Sweet Pickles.—Put equal quantities cauliflower, onions and little cucumbers in brine for a week, each vegetable separate. Drain off brine and put vegetables in layers in kettle. Make syrup of 1 quart vinegar, 2 pounds brown sugar, ¼ teaspoon black pepper, 1 large onion, cut fine, 1 small pepper. Pour this syrup over the vegetables, bring to a boil and fill jars with them, putting into each jar a small piece of red pepper, a piece of green pepper, 2 bits of lemon, 2 teaspoons celery seed, 1 teaspoon coriander seed and ½ teaspoon mustard seed. Seal cans at once.

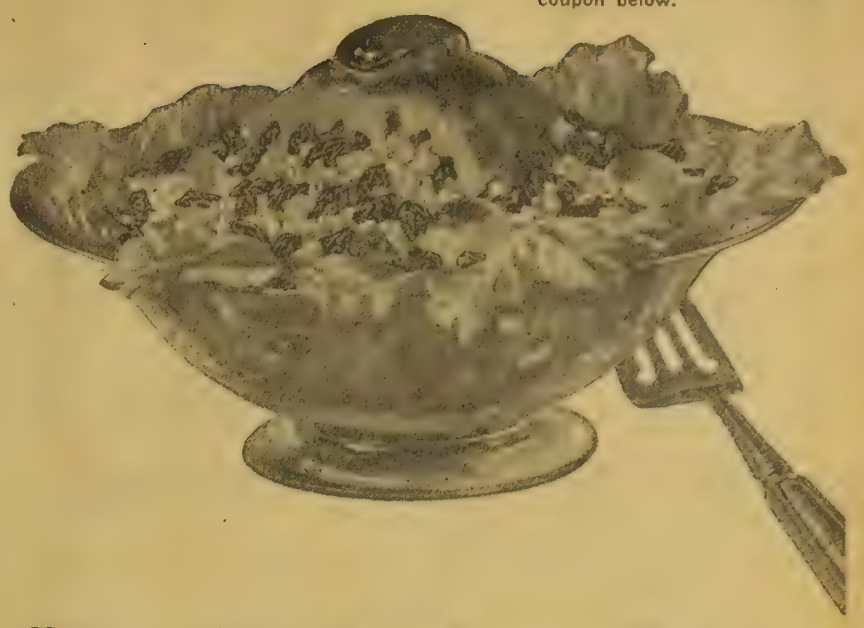
Mixed Mustard Pickles.—Place in brine made in proportion of ½ cup salt to 1 quart water and let stand over night: 2 pints small cucumbers, 1 pint small onions, 1 cup string beans (string and break as for cooking), 3 chopped green peppers, 3 chopped red peppers, 1 pint small green tomatoes cut in half, 1 pint cauliflower broken in small pieces. Freshen in clear water, scald in vinegar and water equal parts, sufficient to cover.

Make mustard dressing of 1 quart vinegar, 4 tablespoons flour, 1 cup sugar, 3 tablespoons powdered mustard, ½ tablespoon celery seed. Rub dry ingredients together, heat vinegar to boiling and add gradually, working into fine paste. Cook in double boiler till

(Continued on Page 42.)

FREE

A valuable book, "Sun-Maid Recipes," will be sent free to those who mail the coupon below.



Rosy Cheeks From Raisins

Certain foods, madam, bring the good looks of good health, due to the **food-iron** *they contain. This luscious raisin salad is one of them*

Raisin Salad

1 cup Sun-Maid Seeded Raisins
¼ cup lemon juice
2 cups chopped apples or pears
2 cups coarsely shredded lettuce
1 cup cream mayonnaise

Wash and dry the raisins, add to the apples and lemon juice. Line bowl or plates with shredded lettuce, pile raisins and apples in center, cover with mayonnaise; serve with Neufchatel cheese balls and garnish top with small pieces of red, tart jelly. Shredded lettuce is a matter of taste. It will go farther and decorates better if shredded.

Send for 97 other "Beauty" Recipes

Don't fail to send the coupon for 97 other "beauty" recipes. Raisins lend charm and healthfulness to many other foods, also increasing their nutrition. The book is worth while and is free, so send for your copy now.

There's more than merely flavor in the luscious raisin foods that we suggest.

There's food-iron—an essential to good health.

Without your necessary supply of iron in the blood you are paler than you should be to be pretty.

The bloom of youth which shows on young girls' and children's cheeks is evidence of that proper supply of iron. It is the **true beauty**—the good looks of **good health**—and there's no reason why all women shouldn't have it.

Serve raisins frequently in salads and desserts—in puddings, bread, pie, cakes, rolls, etc. Stewed raisins is a luscious breakfast dish and one of the most healthful known. Great sanitariums, like that at Battle Creek, Michigan, prescribe them for anemic patients.

The raisin is also slightly laxative, which helps to keep complexions clear.

* * * *

Use Sun-Maid Raisins—California's finest, made from thin-skinned, tender, juicy table grapes. **Clean, sweet, wholesome American** raisins—the kind you **know are good.**

Three varieties: Sun-Maid Seeded (seeds removed); Sun-Maid Seedless (grown without seeds); Sun-Maid Clusters (on the stem).

Be sure to send for the free book of luscious "beauty" recipes.

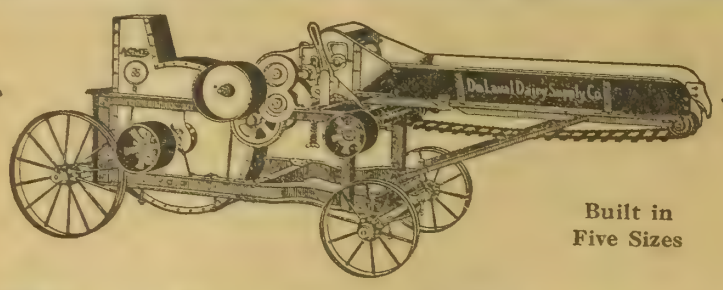
FILLS THE SILO

MAKES ALFALFA MEAL

CUTS DRY FEED



Built in Five Sizes

The ACME Cutter

While waiting for the silage crop to ripen use the Acme Cutter to chop all your dry hay and make your alfalfa meal. Chopping alfalfa hay increases its feeding value 25%.

You can be saving feed and money all through the year with the Acme.

It's a combined Silo Filler, Hay Chopper and Alfalfa Meal Machine. Hundreds of successful Pacific Coast dairymen now use the Acme Cutter.

Cutter Catalog and Sample Acme Made Meal Mailed Upon Request

DE LAVAL PACIFIC COMPANY

61 Beale Street, San Francisco

Either of These Bulls

Will Put Your Herd in Line With the Leaders

More good herds are headed by sons of KING KORNDYKE PONTIAC 20TH, the $12,000.00 son of Miss Valley Mead De Kol Walker, than by the sons of any other sire yet developed in California, and among them is the $41,000.00 bull King Korndyke Pontiac Acme, heading the high class herd owned by Anita M. Baldwin, Santa Anita, California.

Practically my entire herd of females is made up of daughters of KING KORNDYKE PONTIAC 20TH, heifers yet to drop their first calves, all of which I expect to develop fully.

I have for sale two high class sons of KING KORNDYKE PONTIAC 20TH that I consider good enough to head herds of high class registered females, and they are priced well within their value.

KING KORNDYKE PONTIAC FOBES MONA 316441
Born December 5, 1919

Sire: KING KORNDYKE PONTIAC 20TH.

Dam: MONA FOBES, 863.96 lbs. butter from 22,733.7 lbs. milk in 305 days, carrying a calf 231 days. She also made 30.12 lbs. butter from 514 lbs. milk in 7 days. She is a daughter of the well known 30 lb. bull Mutual Fobes Longfield De Kol, and is out of a daughter of Sir Ormsby Burke Segis, one of the best proven sons of King Segis. Second dam a 22 lb. cow, third dam with 795.46 lbs. butter in one year and 26.41 lbs. in 7 days at 10 years of age.

SIR PONTIAC SKYLARK ORMSBY 330700
Born January 8, 1920

Sire: KING KORNDYKE PONTIAC 20TH.

Dam: SIR SKYLARK ORMSBY HENGERVELD PET 2ND, 32.01 lbs. butter from 621.6 lbs. milk in 7 days, and she made 30.33 lbs. butter from 512.1 lbs. milk in 7 days at her previous freshening. She is by King Pontiac Netherland Segis, one of the good proven sons of King of the Pontiacs, and is out of a half sister to the noted twice 34 lb. cow Gerben Abbekerk Maid.

Both of these bulls are excellent individuals, well marked, and ready for service. If you want one of them act promptly as they are priced to sell.

W. J. Higdon **Tulare, Cal.**

Holstein Sale Season Closes Strong

The spring and summer sale season came to a close June 29 when the Gotshall and Magruder herd of registered Holsteins was dispersed. Few sales of the season have furnished more convincing proof of the stability of the Holstein business in this state and none have been held which at the close appeared to leave so many buyers without cattle. A remarkable feature was the fact that though 13 buyers appear in the sale list, one man, F. L. Hogue of Santa Barbara, secured the bulk of the offering, taking 65 head. Mr. Hogue, who is a large land owner, is developing a new property in Stanislaus County where he plans to install his newly purchased cattle. The fact that he was able to select such a large number of the catalogued lots in no way indicates a lack of buyers in attendance. As a matter of fact, a large crowd was present and furnished plenty of competition on nearly every animal up to their limits, and it is known that at the close of the sale several would-be buyers for as many as 30 head went home without cows.

Eighty-three catalogued lots from the Gotshall and Magruder herd averaged $405; nine head from the W. A. Walker herd made $288, and 92 head of the catalogued lots, many of which were young, made a general average of $394.

The $1,000 mark was reached but three times and passed but once. Moxee Lucy, a three year old granddaughter of Sir Johanna Ruth Fayne, topped the sale, going to Chase Bros. of Escalon, who were persistent bidders on nearly all of the better things. One of the real bargains of the sale was the three year old daughter of Sir Aaggie De Kol Acme, Jane Creamelle De Kol Acme, that went to W. A. Walker for an even thousand. Mr. Hogue secured a real cow in the 25.69 pound Josie De Kol Fobes Tritomia 2d, that fell to his bid of $1,000.

One of the most critical buyers of the sale was Noel Negely, Escalon, formerly in the dairy division of the United States department of agriculture. Mr. Negely selected five head.

Horace Hill, Jr., owner of the Toyon Farm, selected a seven months old daughter of Sir Aaggie Mead at $400.

The sale marked the closing up of the affairs of the Gotshall and Magruder herd and it is understood that a new herd will be established under the name of Gotshall-Magruder and will be conducted under the personal direction of A. R. Magruder.

The sale was managed by C. L. Hughes of the California Breeders Sales and Pedigree Company and was a splendid closing of the most successful season the sales organization has had. Ben A. Rhoades of Los Angeles was on the block and John A. Davis of Manteca was in the ring.

The sale list follows:

1, Josie De Kol Fobes Tritomia 2d, Nov. 1915, 4½ yr., 25.69 lbs.; F. L. Hogue, Santa Barbara, $1,000.
2, Karlray Josie Mead, Aug. 1920; F. L. Hogue, $400.
3, Korndyke Daisy Segis, Dec. 1916, 21.04 lbs.; F. L. Hogue, $650.
4, Karlray Korndyke Colantha, Aug. 1920, F. L. Hogue, $375.
5, Jane Creamelle De Kol Acme, Feb. 1918, 17.76 lbs.; W. A. Walker, Ripon, $1,000.
6, Clothilde De Kol Mead, May, 1919; F. L. Hogue, $775.
7, Boweda Segis, Nov., 1916; F. L. Hogue, $900.
9, It Tola, May, 1918; F. L. Hogue, $825.
10, Mooresta Ormsby of Vina, Dec., 1913, 25.20 lbs.; F. L. Hogue, $800.
11, Moorland Miss Mooresta, Aug., 1917; F. L. Hogue, $700.
12, Moorland Mooresta Ormsby, Dec., 1920; F. L. Hogue, $325.
13, Moorland Mooresta Colantha, Aug., 1918; F. L. Hogue, $550.
14, Moorland Mooresta Fobes, April, 1921; F. L. Hogue, $125.
15, Moorland Mooresta Mead, Feb., 1920; F. L. Hogue, $350.
16, Moorland Lady Colantha, Sept., 1917, 3 yrs., 25.79 lbs.; F. L. Hogue, $400.
17, Moorland Lady Cristeria, Oct., 1920; F. L. Hogue, $200.
18, Moorland Lady Linden, Oct., 1920; F. L. Hogue, $200.
19, Moorland Mabel Haskins, Jan., 1915, 4 yrs., 21.32 lbs.; F. L. Hogue, $825.
20, Spring Farm Cornucopia Ormsby, May, 1915, 5½ yrs., 20.63 lbs.; F. L. Hogue, $775.
21, Karlray Ormsby Valdessa, Oct., 1918; F. L. Hogue, $550.
22, Karlray Ormsby Mead, Mar., 1921; F. L. Hogue, $225.
23, Karlray Hartog Mead, Mar., 1920; F. L. Hogue, $425.
24, Segis Fayne Clara, Mar., 1912, 6 yrs., 21.12 lbs.; Chase Bros., Escalon, $375.
25, Cascade Lucy, Feb., 1916, 643.33 lbs. 357 days; Chase Bros., $600.
26, Moxee Lucy, Mar., 1918, 21 mos., 406.87 lbs. 305 days; Chase Bros., $1,025.
27, Karlray Cascade Hengerveld, Mar., 1921; John Lorieu, Ripon, $350.
28, Cascade Queen Juanita, Feb., 1915; F. L. Hogue, $875.
29, Karlray Cascade Juanita, Dec., 1920; Chase Bros., $325.
30, Albino De Kol Hartog 3d., Jan., 1912, 21.06 lbs.; F. L. Hogue, $310.
32, Karlray Beryl Colantha, Oct., 1920; J. E. Headley, Ripon, $275.
35, Dominita Bonnie De Kol 4th, July, 1912, 21.36 lbs.; J. G. Jamison, San Jose, $385.
36, Dominita Colantha De Kol 2d, April, 1914, 28.74 lbs.; F. L. Nahar, Merced, $535.
37, Karlray Dominita Ormsby, Dec., 1920; F. L. Hogue, $150.
38, Emily Johanna of Masterpiece, Dec., 1916, 21.68 lbs.; F. L. Hogue, $400.
40, Karlray Hengerveld Ormsby, Jan., 1919; F. L. Hogue, $425.
41, Hollywood Lilth Sita De Kol, June, 1915; F. L. Hogue, $400.
43, Johanna Neeltje De Kol, April, 1912, 24.37 lbs.; F. L. Hogue, $275.
44, Klondyke Beauty 2d, Mar., 1913, 26.74 lbs.; F. L. Hogue, $310.
45, Karlray Klondyke Mead, Dec., 1920; F. L. Hogue, $200.
46, Merci Pauline Burke Walker, April, 1919; F. L. Hogue, $550.
47, Karlray Aaggie Colantha, Nov., 1918; F. L. Hogue, $335.
48, Karlray Aaggie Ormsby, Dec., 1920; R. Stevens, Stockton, $150.
49, Moorland Ansella Colantha, Mar., 1916; F. L. Hogue, $325.
50, Moorland Ansella Mead, April, 1919; F. L. Hogue, $300.
51, Moorland Ansella Ormsby, Jan., 1921; F. L. Hogue, $125.
52, Karlray Belle Colantha, July, 1919; F. L. Hogue, $450.
53, Karlray Bonnie Colantha, July, 1920; F. L. Hogue, $200.
54, Moorland Colantha Belle Fobes, Mar., 1921; J. F. Nahar, $85.
55, Creamcup Pontiac Consort Pet, Dec., 1913; F. L. Hogue, $385.
57, Empress Bergsma De Kol, Jan., 1915; Chase Bros., $485.
58, Karlray Foxy Mead., Aug., 1919; F. L. Hogue, $475.
59, Frenesta Pietertje Korndyke, June, 1915; Noel Negley, Escalon, $525.

100, Bessie Pearl Fobes, April, 1916; Leslie F. Miller, Ripon, $155.

Livestock News Notes

In the last monthly news letter of the western office of the dairy division of the United States department of agriculture a grade Jersey cow owned by H. L. Wakeham of Santa Ana is credited with having produced 511.75 pounds butter fat in 151 days.

At a special meeting of the California Holstein-Friesian Association, held at Stockton the evening of June 28, it was decided to subscribe $1,000 toward the $25,000 asked by the management of the California National Livestock Show, which is being planned for this fall. Under the plan adopted for financing the show the livestock interests propose to raise $100,000 and of that amount the Holstein breeders are called upon for $25,000.

The summer sale of Berkshires from the Grape Wild Farm herd scheduled for June 28 proved a considerable disappointment. Owing to harvest being in full swing few farmer buyers attended and the small crowd of breeders and others could not absorb the entire offering. An average of $68.75 was made on the gilts sold.

The Sutter County farm bureau has decided upon a series of fat hog auctions to be held this fall, the first taking place in October. Swine raisers in Butte and Yuba Counties will be asked to consign to the sales.

Hogs sold from $10 to $10.30 in auctions at Tulare, Visalia, Hanford and McFarland June 21-24. In each sale preference was given the light handy weights. The top lot averaged 163 pounds.

Miss Valley Mead De Kol Walker, the famous dam of King Korndyke Pontiac 20th, Sir Prince Aaggie Mead and Sir Aaggie De Kol Mead, after completing the splendid 305 day record of 1,006.24 pounds butter from 22,148.4 pounds milk, has freshened again after a short rest, dropping a fine heifer calf by Sir Pietertje Ormsby Mercedes 43d. She is again on test and in seven days made 33.14 pounds butter from 725.4 pounds milk, and in 30 days 133.45 pounds butter from 3,021.4 pounds milk, with 108.7 pounds for her best day. She is being continued on yearly test again by her owners, A. W. Morris & Sons.

A number of excellent official records have recently been made in the high class herd of registered Holsteins owned by Robt. N. Clapp of Nuevo at his farm, Sycamore Acres. The famous cow, Gerben Abbekerk Maid, now in her tenth year, with ten living sons and daughters, made 852.3 pounds milk in seven days and 3,460.7 pounds in 30 days, best day 124.6 pounds. She is being continued on yearly test. Her junior four year old daughter, Abbekerk Pontiac, made 25.59 pounds butter from 446.9 pounds milk in seven days. Four more daughters of the good bull King Pontiac Netherland Segis 3d, son of Gerben Abbekerk Maid, completed excellent records. Rosamaines Rowena, a junior three year old, made 28.79 pounds butter from 551.2 pounds milk in seven days, and 115.81 pounds butter from 2,398.8 pounds milk in 30 days. Aralia Pontiac as a four year old made 26.25 pounds butter from 536.5 pounds milk in seven days. Rosamaines May Korndyke at two years four months made 21.12 pounds butter in seven days, and her full sister, Rosamaines Korndyke Beauty, has lately made one of the greatest heifer records ever made in California. Freshening at one year and ten months she made 22.24 pounds butter from 575.1 pounds milk in seven days, 88.27 pounds butter from 2,368.7 pounds milk in 30 days, and continued on test made 160.46 pounds butter from 4,525.1 pounds milk in 30 days. Mr. Clapp recently added another high class lot of females to his herd and now owns one of America's strongest herds in the blood of King Segis.

One of the highest producing small herds of registered Holsteins in California at present is owned by W. A. Walker, Ripon, where some especially noteworthy yearly records are in process of making, with two already completed. A daughter of Lad Legend of Kakenstein lately finished with right around 940 lbs. butter in 365 days, and a daughter of Arcady Pontiac Wayne Hengerveld finished with over 800 pounds in 305 days. One of the promising records in the herd at present is being made by Belle Faskie Hengerveld De Kol 2nd, who was grand champion at the 1918 California State Fair. She is milking right up at the 100 pounds per day mark and her chances look very promising. She is the dam of the great Freeman & Edwards heifer at Modesto, Belle Faskie De Kol Witkop, that made over 800 pounds butter and over 20,000 pounds milk as a first calf junior two year old. Mr. Walker has at the head of his herd the richly bred young bull Dutch Vina, sired by the Freeman & Edwards bull Segis Pontiac De Kol Dutch, and out of a dam that recently completed a year with over 1,150 pounds butter from 29,009 pounds milk.

One of the sensational Holstein records of the year is under way in the herd of John Saxer, Modesto, where the senior three year old Moorland Colantha Rose has milked over 18,000 pounds in 182 days and has over 700 pounds butter to her credit in the same time. She made over 126 pounds butter in her sixth month. This heifer has been fed, cared for and milked throughout the entire time by Olga Saxer, 17 year old daughter of Mr. Saxer, who is handling her in this test in a manner that might well be the envy of some of the best men handling test cows. Moorland Colantha Rose is an exceptionally good individual with plenty of size and has a correspondingly good pedigree, being a granddaughter of Colantha Johanna Lad.

Manteca Lyons Jewel Glista, a first calf daughter of Supreme Glista Pietje, recently made an official record of 13.79 pounds butter from 338.3 pounds milk in seven days in the registered Holstein herd owned by J. W. Scudder, Escalon, her test coming during one of the hottest spells of the season.

Wm. F. Wattson, El Cerrito, who has been an occasional purchaser in a number of the registered Holstein sales during the past two years, is securing a nice heifer increase in his herd. Manteca Segis Alban De Kol, purchased from Henderson Company, has contributed two good heifers to the herd, while Laconner Netherland Pontiac Girl, secured from Carnation Stock Farms in the last Guaranty Sale at Sacramento, recently dropped a beautiful heifer calf by the famous bull Matador Segis Walker.

STATE FAIR PREMIUM LIST

The premium list for the 1921 California state fair, which is to be held at Sacramento, September 3 to 11, inclusive, is now being mailed to exhibitors and others throughout the state and elsewhere.

In the book attention is called by President H. A. Jastro and Secretary Chas. W. Paine of the board of directors of the state agricultural society to the magnitude and variety of exhibits of the 1921 fair which will far surpass any previous exhibition. The principal object of the fair, as explained by them, is to exhibit the resources and products of the state and stimulate Californians to greater efforts for the improvement and development of the state's agricultural, horticultural, viticultural, livestock, mining and mechanical resources.

The list totals approximately $100,000, which will be given as a reward for those who have produced something better for the benefit of the people. Several new classes have been entered in the livestock sections and bigger premiums are offered as an incentive to exhibitors to enter their best stock in this year's show. Student judging of cattle, sheep dog trials, sheep shearing contests, reclassification of milk goat entries, additional prizes in the draft horse classes and improvements in other departments bid fair to make this year's exposition one of the largest and most diversified ever held.

Copies of the premium list will be mailed to anyone upon request to Secretary Paine.

FIVE DUROC BEAUTIES

This group of junior yearling Duroc gilts is a part of the litter farrowed last year by High Lady Sensation, the gilt for which W. H. Dupee paid Winsor Ranch $2,000. They are by Great Sensation 3rd. At 13 months of age they averaged a little over 500 pounds and were not fat.

This litter and the dam were a part of the herd sold by W. H. Dupee to the Sierra Vista Ranch at Perris, and these juniors will be a part of the fine show herd being fitted by Sierra Vista.

MOLASSES

Are You Feeding It?

Every man who feeds stock has wished for a way to save the waste that comes with the feed left in the mangers. The cheap roughages that stock leave in the mangers *can* be converted into profit making feed, that the stock will clean up to the last straw, and will thrive on.

Here's the Way to Do It.

Feed Camo Pure Hawaiian Cane Molasses. The sweetness of molasses affects stock like candy does a kid, and they eat and eat and eat. And the nice part of it is the fact that molasses is *good* for your stock. It acts as a tonic and conditioner. It fattens and builds milk production. But get the facts. They are in a booklet we have here for you.

COW TESTING ASSOCIATIONS IN ARIZONA

By M. E. Bemis

EVIDENCE that Arizona dairymen are "coming alive" is apparent every day. Pima County dairymen have a cow testing association that has been in operation for some months. Following the opening of the Tempe condensed milk plant there has been organized in the Tempe district an association with 29 dairymen and more than 600 cows. Under the plans of this association the tester spends one day of each month with each member of the association, the milk from each cow is weighed and recorded and a sample of each milking taken and tested. From these weights and tests the records of the cows are computed. Other records, such as the age of the cow, time of freshening, breed, etc., are kept, so that at the end of the year each member of the association has a fairly complete record of each cow in his herd.

Cow testing associations are not new in the Salt River Valley although none have been active during the past four years. The advantage of associations of this kind has been proved times without number. It is the poor cows that hold back the herd from making a profit. The record of the year's test, or frequently less, enables the owner to cull out the unprofitable cows. It is so plainly obvious that the cost of feeding and caring for the poor cow is so near the cost of the good cow that it would seem no argument ought to be necessary to convince any dairyman that it is decidedly to his interest to affiliate with an association.

Some dairymen appear to be of the opinion that they lose when a cow is proved to be poor. In a way this is true for the selling value of a cow is decreased if her production is low, but on the other hand the value is increased if the production is high. In the average of a herd there would be almost sure to be a greater gain from increased valuation than loss from decreased valuation. In any herd where this would not hold true the loss from milking so unprofitable a herd would be so great as to make it a losing game anyway.

We hope to see a cow testing association in every dairy community in Arizona before the end of 1921.

CALIFORNIA NATIONAL

C. R. Thomas has been chosen manager of the California National Livestock Show to be held in San Francisco, October 22-30. C. N. Hawkins of Hollister is president. We hope this is the beginning of a permanent livestock show for California.

The livestock end of the state fair has been growing in importance and has been a credit to the state. The shows formerly held at San Francisco and at Los Angeles have likewise been successful in bringing together a fine representation of California's good breeding, but neither of the two big towns of the state have yet succeeded in putting their shows on a permanent basis.

NEW RULES FOR INTERSTATE SHIPMENT

Regulations governing interstate movement of livestock, which became effective on and after July 1, 1921, and which supersede previous regulations on this subject, have been published by the United States department of agriculture. For purposes of identification these regulations are designated as B. A. I. (bureau of animal industry) Order 273. The regulations published in the circular prescribe for the inspection, disinfection, certification, treatment, handling, and method and manner of delivery and shipment of livestock which is subject to interstate commerce. The enforcement of the regulations is assigned to the secretary of agriculture by acts of congress. Their purpose is to control the

interstate shipment of livestock and prevent the spread of diseases.

Included in the publication are acts of congress relating to this subject, general provisions, and regulations to prevent the spread of the following diseases: Splenetic, southern, or Texas fever in cattle; scabies in cattle and sheep; dourine in horses and asses; hog cholera and swine plague, and tuberculosis in cattle.

Why Build a Silo?

NOT only will the silo save 40 per cent of the corn crop from waste and deterioration, but it puts it in better condition for feeding purposes. One acre of corn preserved in the form of silage has a feeding value equivalent to that of one and one-half to two acres preserved in the form of shock corn. In seasons where the grain fails to develop the ratio in favor of silage may run as high as one to five.

Silage has no equal in reducing feed costs. During the last few years all feeding tests with beef and dairy cattle have shown that where silage is used as a major portion of the ration, beef and milk are produced most cheaply. During the winter 1917-18, the Kansas experiment station fed one lot of baby beeves corn, linseed meal and alfalfa hay. Another lot was fed corn, linseed meal, alfalfa hay and silage. In the latter lot the cost of gains was $1.20 a hundred cheaper than in the former, and it sold on the market at 25 cents a hundred more.

During the last ten years, due largely to the expense of winter maintenance of the cow herd, the number of beef cattle on Kansas farms has decreased 50 per cent. In view of this fact it is significant that the Kansas experiment station kept mature cows in good breeding condition during the winter 1917-18 on a ration chiefly of silage and wheat straw at a cost of five cents a day.

The dairyman has used silage longer than the cattle feeder though it is equally valuable for both. In a report of the cow testing associations of Minnesota covering records of 5,500 cows it is shown that the cows receiving silage produced 1,275 pounds more milk per cow and 51 pounds more butterfat than did those not fed silage.

In a farm management contest conducted by the Wisconsin agricultural college, records of the business were secured on 531 average farms for two successive years. The 390 farms which had silos made an average net profit of $875 per farm, while the 141 without silos made an average net profit of $535 per farm per year. It is pointed out that the difference, or $340 per farm, is enough to pay for a good silo once a year.

Silage alone is not a balanced ration. For the best results it should be supplemented with a small amount of clover, alfalfa, cowpea hay, or linseed or cottonseed meal. This is particularly important in the case of calves and young stock. Silage and alfalfa hay make the cheapest ration obtainable for feeding a dairy cow. One giving less than a gallon and a half of milk daily needs nothing else.

The general advantages of the silo and silage may be summarized as follows:

The silo reduces the amount of labor required to feed livestock during the winter, also in preparing the ground for next year's crop.

More livestock may be carried on a given acreage when crops are fed in the form of silage.

Silage insures the utilization of practically the whole corn or sorghum plant. Feeding in any other forms results in the loss of from 20 to 40 per cent of the plant.

The silo is an economical means of storing feed. A cubic foot of hay contains approximately four pounds of dry matter while a cubic foot of silage contains ten pounds.

The silo preserves the succulence of the plant ensiled and this has a beneficial effect upon the digestive organs.

The silo preserves the palatability of the plant ensiled and the animal will consume more roughage than when fed in any other form, thus resulting in a saving of other feeds.

The use of silage lessens the costs and adds finish in fattening cattle.

Silage insures a succulent feed for any season of the year.

Silage eliminates the bother of cornstalks in handling manure.

Manure is more easily preserved and less plant food is lost when crops are fed in the form of silage. — Kansas College of Agriculture.

BLOAT

Other plants may cause bloating, but the leguminosae are the most dangerous in this respect. In mild cases it is not necessary to puncture the stomach as the administration of medicines which absorb the gases and allay fermentation suffice to bring about a normal condition. Kneading and massaging the left flank for 10 or 15 minutes frequently terminates mild cases. In cases where the bloated animal is in distress from the pressure produced on the internal organs, a puncture should be made immediately in order in many cases to save the animal's life.

The puncturing is done with more assurance of safety by means of a trochar, a short, sharply pointed rod enclosed in a sheath which permits only the point of the rod to project. The puncture is made at a point equidistant from the last rib, the hip bone, and laterally projecting portions of the backbone in the region of the loins.

To insert the instrument it is more convenient to make a slit through the skin at the point of puncture. Then take the instrument and with the point directed toward the right elbow give the top of it a sharp blow with the palm of the hand. The trochar is then withdrawn from the sheath or tube, through which the gases escape. The operation may be repeated if gases again accumulate.—State Department of Agriculture.

GLENN CALF CLUB

The Holstein breeders of Glenn County, not to be outdone by the Jersey breeders, have a calf club of their own breed, in which 12 boys and girls have each selected a pure bred Holstein calf of high quality which they will take care of and develop as best they can under the directions of the county club leader. Eleven of these 12 calves are heifers, the twelfth is a bull. Two were secured within the county and the remaining ten have been imported for the club work.

Willys Light

*Power and Light with the Quiet Knight

$525

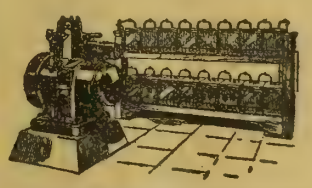
There never was such a remarkable reduction in price as this. Here is a practical power and light plant which is admittedly superior in every sense.

—And yet so reasonably priced that every home in North America can now have the convenience of electricity.

Precedent has been swept aside in meeting what we consider our obligation to the American farmer—giving him the benefits of our tremendous purchasing power, sound engineering and manufacturing economies in this electric plant highest in quality yet lowest in price.

Willys Light is an established success. One exclusive superiority alone, the Willys-Knight sleeve-valve engine, is of itself a sufficient reason for buying *only* Willys Light. In addition it has fifty distinct advantages.

Thousands of homes where electric current is not available will take advantage of this opportunity *now*. See your Willys Light dealer —there is one near you.



The famous air-cooled Willys-Knight Engine burns kerosene, cranks itself, stops automatically, and "improves with use".

*The Willys-Knight sleeve-valve engine

Every Home Can Now Have Electricity

Willys Light Junior

JUNIOR

$295

Here is the "eighth wonder" of the farm power and light world—Willys Light Junior.

It is large enough for lights and small power uses, and more important—it is low enough in cost for every purse and person.

Neat, compact, made with the high quality which characterizes *all* Willys Light products —its very name is a pledge of satisfaction with nation-wide service behind it. It has the wonderful Auto-Lite engine generator, and long-lived dependable battery.

Could there be any greater evidence of our intention to place our entire resources and production capacity at the disposal of every farm home?

Farms that were formerly denied electricity will glisten with safe, clean light at the snap of a switch.

Ask your Willys Light dealer about Willys Light Junior, or write for booklet.

Willys Light Junior has the wonderful Auto-Lite engine generator, a battery of ample capacity and is of standard voltage.

Catalogues and Booklets, office forms and correspondence stationery for the nursery, seed and florist trade; half tone cuts of many standard plants. Correspondence invited. The Kruckeberg Press, 236 Court St., Los Angeles.

Ventura County members of the Prune and Apricot Growers have decided to pay 33⅓ cents an hour for manual labor, 17½ cents per 50 pound box for pitting apricots and $3.50 per ton for contract picking.

HOUSEHOLD QUERIES

(Continued from Page 37.)

it thickens. Pour this over pickles and heat to simmering. Pack hot in jars, boil 15 minutes and seal.

Dill Pickles in Imperial Valley

Is it possible to make dill pickles successfully in Imperial Valley with the temperature from 80 to 115? If it is possible will you please send me a reliable recipe for the making of them?—Subscriber, Brawley.

We do not believe there will be any difficulty in making good dill pickles in your climate. The pickles need to stand in brine in warm place for three or four weeks to ferment. Then they may be heated to boiling in the brine in which they are made and sealed boiling hot in fruit jars just as you would can fruit.

But surely some of our Imperial Valley readers have had experience, and experience is the teacher the Cultivator swears by. Can't they help us out? The Cultivator will be glad to advance subscription credit one year for good answer to this question.

Meantime here are directions for making dill pickles as given by W. V. Cruess in "Home and Farm Food Preservation":

Cucumber Dill Pickles.—Wash cucumbers. Prepare a crock, keg, barrel or wooden bucket. Do not use metal.

Place layer of dill plant in the bottom of the container and a small quantity of mixed dill pickle spices. These can be obtained from a grocery. On these place two or three layers of small cucumbers. Add another layer of dill plant and spices and two or three layers of cucumbers, repeating the alternation of layers until the container is almost full. Cover with layer of beet leaves or grape leaves at least an inch thick. Fill and cover with a brine made of one pound salt, ten quarts water and two-thirds quart vinegar. Allow to stand until fermentation ceases (three to four weeks). Seal with paraffin. Dill pickles may be kept indefinitely by heating to boiling in the brine in which they are made and sealing boiling hot in glass jars.

My Rosary

I've read in the California Cultivator where other people have asked for poetry to be published in the Cultivator and there is one, "The Rosary," that I've wanted badly for so long and I can't find it anywhere, so could you publish it in the home department if it wouldn't be asking too much?—Subscriber, Holtville.

My Rosary

The hours I've spent with Thee, Dear Heart,
Are as a string of pearls to me.
I count them over, every one apart,
My Rosary, My Rosary.

Each bead a pearl; each pearl a prayer
To soothe a heart in absence wrung.
I count each bead unto the end — and there
A cross is hung.

O memories that bless and burn,
O barren gain and bitter loss,
I count each bead and strive at last to learn
To kiss the cross, Sweetheart, to kiss the Cross.

Pickled Walnuts

Can you make pickles out of green walnuts? If so, please tell me how.—Subscriber, Ventura.

Nuts should be gathered when they are tender enough to be pierced with needle. Make strong brine, 4 pounds salt to gallon water. Prick skins of walnuts and put in brine for nine days, but change brine every third day. After nine days drain off brine and place in sunshine, moving occasionally, until they are evenly black. This will take two or three days. Pack jars three-fourths full of nuts and pour over them boiling syrup made in proportion of ½ cup brown sugar, 2 ounces cloves, 1 ounce black pepper, 1 ounce allspice, 1 ounce bruised ginger, 1 stick cinnamon. Boil spices (in cloth) in vinegar ten minutes and pour over nuts. In a day or so take off syrup, reboil and pour over nuts. Repeat a second time. Then seal or cover closely and put away in cool, dry place. They should stand about a month before using.

HOW THE LIVE OAK PIG CLUB WAS ORGANIZED

On Wednesday, June 15, a meeting of boys and girls and their parents was held at the Greenwood Farm of Witherow and Stafford, and under the direction of Frank S. Spurrier, assistant state leader of clubs, the Live Oak Registered Durco-Jersey Pig Club was organized.

John Leighton Ames Jr. was elected president and Vorus Roulsten secretary. The membership of the club includes the following boys and girls: Grace Aloise Ames, Mary Rosini Charles Vantress, Horace Vantress, Lewis Farrar, Russell Bowman and Frank Hansen.

Messrs. Witherow and Stafford furnished the pigs and each of the club members made a selection from the lot offered them and signed the following agreement:

This agreement was made and entered into on June 15, 1921, between Witherow & Stafford, hereafter referred to as owner, and .....; hereafter referred to as boy.

1. The owner is to let the boy have a pure bred Durco-Jersey gilt to raise.

2. The boy must enter the Live Oak Pig Feeding Contest, and is to feed and care for the gilt under the direction of H. C. Witherow and Frank Spurrier, assistant state leader of clubs.

3. When the pig is about eight months old the owner agrees to breed the pig free of charge. The boy agrees to bring the pig to the owner's ranch for breeding.

4. When the sow's pigs are eight or nine weeks old a division is to be made on either of the following plans, the boy to have his choice of propositions:

(a) The boy may own the sow, and the owner the pigs.

(b) The boy may own the pigs, and the owner the sow.

(c) The boy may own one-half interest in the sow and one-half of the pigs, and the owner one-half interest in the sow and one-half of the pigs.

5. The owner agrees to replace the sow if she should unavoidably be injured or die, the director of the Live Oak Farm Bureau Center to be the judge.

6. If the boy desires, the owner further agrees to purchase at the time when the above division is made the boy's one-half interest in the sow at 12 cents a pound, and the boy's one-half of the pigs at 12 cents a pound for boar pigs and 18 cents a pound for sow pigs, and, if so desired, the boy may buy the sow from the owner at the same rate as above mentioned, and also the pigs at the same ratios as above mentioned.

7. The boy must make all deliveries of hogs.

8. The owner agrees to furnish $25 to be divided as prizes among the club members who do the best.

9. The owner agrees to pay the boy 12 cents a pound for all gain on sow in case she fails to breed, or to replace the sow.

(Continued from Page 30.)

FRESH FIGS SHIPPED EAST

Company of Fresno, which had active charge of the shipment from California through to the actual marketing in the East.

This is the first time a carload shipment of fresh figs has ever left the state and marks the launching of a new departure in the fig industry. Guided in their judgment by the overwhelming demand on the Pacific slope for the fresh fig, officials of the California Peach and Fig Growers believe that a fertile field will be opened by the shipment.

The great drawback heretofore to fresh fig shipments East has been the indifference in packing and care. The four concerns identified with the shipment have been studying the problems for several months and believe that a solution of shipping difficulties has been reached.

The National Livestock Exposition recently in annual session at Cleveland voted to hold its annual for 1922 at Kansas City. Its president is Everett C. Brown of Chicago.

New Life for Old Shingles

That old shingle roof—neglected—is a danger signal! It means the cost of repairs or even a new roof soon, unless you put it in good condition.

ORONITE SHINGLE OIL *Preserves Shingles*

Natural oils in the fibre of unprotected shingles soon evaporate from exposure to the hot sun. Cracking and warping of the shingles follow—and the roof begins to leak. Rain and wind penetrating the shingle fibre hasten disintegration and decay.

An application of Oronite Shingle Oil will help put your shingle roof in condition to stand up to the weather and give longer service to you. Oronite Shingle Oil is a high-quality preservative for all shingles—on roof or on side walls. It penetrates the shingle fibre with a moisture-resisting preservative. It retards evaporation of natural oils in the wood and counteracts the effect of age and exposure.

Oronite Shingle Oil will cover from 80 to 100 square feet of shingles per gallon, according to the age and condition of the shingles. It can be mixed with colors—ask our nearest agent for formulas. Use Oronite Shingle Oil on your roofs—*now*. It may save the cost of repairs or even an entire new roof next season.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Soldiers Aid Bill

Has the soldier aid bill become a law?—Subscriber, Valley Center.

From newspaper reports it seems that congress is still debating the federal act. An act has been passed and approved by the governor in the state of California but it will not be until some time in August at the earliest when it will be operative.

House Not Moved

I sold a piece of my farm, together with a house upon another part. Under the provision of the bill of sale it was required that the house be removed within one year. The purchaser of the house later sold it and the house has been on the land 16 months but has not been removed. I have rented this land to another party and desire to take it off. What can be done?—Subscriber, San Diego.

The house has become personal property and the parties have unlawfully been permitted to remain on your land. It would be well to notify them that you are holding this property for them for a certain definite stated time and that at the expiration of that time you will cause the house to be sold as pledges or other property are caused to be sold. Upon such sale you would undoubtedly have the right to purchase it for the rental value of the land which it occupies and tear it down.

Bees a Nuisance

A party keeps bees near a fruit orchard. They cause loss of much of the fruit besides annoyance. What is the remedy?—Subscriber, Garden Grove.

Unless there is some county ordinance there seems to be no definite state law applicable to the case and there would hardly be any relief. There have been instances wherein injunction suits were brought to restrain the depredations of bees, but the difficulty there is the proof that bees of the party against whom the suit is brought are the ones that are doing the damage. If this can be proven, undoubtedly under the general rule of nuisance he would be required to restrain his bees from entering upon your property.

Takes Swarm of Bees

A man came into our back yard and took a swarm of bees from our hives, saying that they has just swarmed. Has he any right to do this?—Subscriber, Arroyo Grande.

He had no right whatever to trespass upon your property. Indeed, there are many decisions to the effect that bees are in the nature of wild animals and that when they swarm they belong to the person who seizes them rather than to the original owner of the hive from whence they came.

Cows on Contract

I bought a small herd of cows on monthly payments. Three died. The veterinarian stated that all were diseased. Two of the payments were missed and the vendor retook the cows. Have we any redress? — Subscriber, Hynes.

Undoubtedly when the cows were sold they were sold as healthy cows. If that was not the case, then you would certainly have a right of action to recover the difference between the value of the animals in the diseased condition in which they were and their value if they had been as represented.

Disposition of Estate

Husband originally had separate property, to which when married to second wife was added her separate property. This was then traded for a ranch in California. Subsequently the husband placed a homestead upon this ranch. Thereafter he made out a deed to this ranch to a son by the first

Poultry Can Be Made Profitable

wife for love and affection. The husband thereupon placed the deed in his trunk and died. The son came on, took the deed from the trunk and recorded it. There was no will. What are the rights of the parties?—Subscriber, Chula Vista.

Apparently this marriage took place in an Eastern state. The California community property law does not apply in many of these Eastern states. Therefore the question of the original respective rights of the parties would be necessarily determined by the state wherein the marriage took place. Apparently this real property stood in the husband's name in the state of California. As he placed a homestead upon this land it was either his own separate property or community property. Under the rule of law the real estate would go to the wife as surviving joint tenant. The deed of the husband to the son would be ineffectual upon that ground. This deed would also be invalid for the reason that there was no delivery made by the husband to the son prior to death. The placing of it in his trunk and merely informing the son to obtain it could be no delivery. The title to the property is, of course, clouded by this deed and it would be necessary to take action against the son in order to clear the title of the wife to the property and have declared of record the fact of the death of the husband.

Federal Farm Loan

Can I borrow money from a federal farm loan bank to stock our dairy? I noticed the law provides for a loan to pay for a prior loan to make improvements but contains nothing about stocking ranch.—Subscriber, Hynes.

Federal farm loans may be made for the following purposes: To provide for the purchase of land for agriculture; to use for the purchase of equipment, fertilizers, and livestock necessary for the proper and reasonable operation of a mortgaged farm; to provide buildings and the improvements of farm lands; to liquidate mortgages existing upon the land. The terms "equipment" and "improvements" are such as may be defined by the federal farm loan board. The provision for the purchase of livestock is expressly included, and the term "equipment" would undoubtedly include necessary farming improvements, which would propably depend upon the size of the farm and character of the use. Improvement would doubtless also bear relation to the character of the farm.

Poultry Queries

(Conducted by Jean A. Koethen)

Poults Pick Toes

My young turks have a habit of picking between their own toes until they crack. They pull at them nearly all the time. When they get ready to hover under the hens they stamp their feet and seem to be in misery. This happens after they are about two weeks old. I feed them well, hard boiled eggs and baby chick feed, and always fresh water and grass. I thought perhaps it was cholera. They get weak and if the hen steps on them they die of weakness, and they generally run around on the ball of the foot and turn up their toes. Some of my neighbors say that ants bite them, so they have to pick their toes. I have taken them from the mother hen and put carbolated vaseline on their feet. They eat well but do not like to be shut up. I thought if I kept them from running out it might help. —Subscriber, Corning.

This question was sent by inquirer to Dr. Beach of the state college of agriculture, and he writes: "It is very probable that the cause of your young turkeys picking their feet is that they are irritated by some sharp object or irritating chemical substance. In sections of the United States where young turkeys are run on land on which cactus is growing it has been found that the thorns on the cactus will stick on their feet. It is very possible that there are other forms of vegetation which will cause a similar injury. It has also been observed in some localities that alkali soil is very irritating to the feet of young birds. It is my opinion that some such cause is responsible for your trouble."

May Be Mites

Can you tell me what causes my chicks, seven weeks old, to huddle together and droop and die? There is no sign of blood in the droppings, the house is new and they are carefully fed and kept.—Subscriber, Inglewood.

I should look for mites, even if the house is new. This is the season when they breed most rapidly, and if they once begin to suck the blood of your young chickens the results would be just what you have described. Look under ends of roosts and in cracks. If you see a grayish dust, that is mites. If you cannot see anything, put your hand and arm in the coop for a few minutes after dark. You will feel them crawling if they are there. Even if you should be satisfied that there is not a mite on the place, it is safest to paint once a week with kerosene and crude carbolic acid, 1 part acid to 5 or more of kerosene. Paint every corner, roosts and walls near the roosts, and do it early in the morning so the fumes will have time to evaporate before night. It is possible the chicks are drooping because they are overcrowded or because they have not a suitable growing ration. As you do not tell me how they are kept and fed I can only suggest that in addition to disinfecting the coop you keep a good commercial growing mash before them and give plenty of cracked corn in the scratch.

Mites Again

Can you tell me why my chickens, ten weeks old, are dying? They stand around with their wings drooping, eyes shut and heads under wings, no appetite. They have mash with buttermilk and grain at night; everything clean.—Subscriber, Compton.

See answer to Inglewood subscriber above. June is the month when we see this mysterious drooping and death, and the answer, 99 times out of 100, is mites. Roosting quarters should be disinfected frequently at this season whether there are indications of mite infestation or not. If they are not there, they will be, no matter how new and clean the house. Painting or spraying with an insecticide such as crude carbolic acid and kerosene, carbolineum, or a cresol preparation, is the only way to keep them out.

Feeding Pullets

How shall I feed my White Leghorn pullets, hatched early in February, so that they will lay during the winter, and when ought I to encourage them to start laying?—Subscriber, Lindsay.

As soon as the first egg is dropped take away the laying ration, or the growing mash if they have not had a laying ration, and place before them a maintenance mash of bran and ground bone (bone meal), 95 per cent bran and 5 per cent bone meal, and add to their scratch feed all the cracked corn they will eat. The corn fattens them and the bran and bone meal develop frame without encouraging production. Keep them on this ration till you see they are bound to lay in spite of it, then put them back on the laying mash with a mixture of wheat, oats and barley, or three other grains if you prefer, for scratch feed at night. If you can add sprouted oats or barley or sour milk or a mash moistened with milk once a day to the foundation of dry mash and scratch feed, and feed at all times a liberal supply of greens, they will lay fast enough without other encouragement.

Jobbing: Standard 1.85@2.00, few fancy 2.25, poorer 1.50@1.75, ponys mostly 1.50@1.65, poorer 1.25@1.40.

Cherries: Supplies moderate, market steady. Whites, various varieties mostly 10@12, few 13@15, ordinary 8@9 per lb. 10@12; Blacks, various varieties 10@14; Bings fancy 18@22 per lb., according to quality; poorer 13@15.

Figs: Supplies light, market firm. Northerns, flats, Black Spanish 1.00@1.25. Imperial Valley, San Pedros, flats 85@1.00.

Grapes: Supplies light, market steady. Per lb. 12@14.

ket firm; 30 pint crates 3.00@3.25.

Loganberries: Supplies moderate, market steady; 30 pint crates 2.50@3.00; few 3.25.

Peaches: Supplies light, movement moderate, market steady; wide range in quality and condition. Lugs, various varieties, best 1.25, poorer 75@1.00, fancy Redbirds 2.50@3.00, various varieties 5@6 per lb.

Plums: Suplies liberal, movement moderate, market weak. Santa Rosas mostly 5, few varoius varieties mostly 3@5 per lb.

Prunes: 5@6 per lb.

Raspberries: Supplies heavy, market weaker. Cuthberts 2.50@3.00.

Strawberries: Supplies moderate, movement slow, market weaker. Per crate, No. 1's 3.00@3.50, No. 2 stock 2.25@2.75.

Watermelons: Supplies liberal, market steady, mostly 2@2½ per lb., poorer 1½@1¾. Jobbing: Klondykes, 38.00@40.00 per ton, other varieties 30.00@35.00; poorer 25.00.

CITRUS FRUITS

Grapefruit: Suplies liberal, market steady, movement slow. Local: Per box, market pack 2.00@2.50, special packed brands 3.00@3.25; ordinary 1.75.

Lemons: Supplies moderate, market steady, wide range in prices. Locals: packed box 4.50@5.00; few fancy 6.00@7.00; loose 1.50@1.75 per box; few fancy, 2.00@2.50; per lug mostly 50@75.

Oranges: Supplies liberal, market steady. Valencias, best brands, all sizes, 3.50@4.00, few 4.50; ordinary 3.00@3.25; packing house culls 50@75, few best 1.00@1.75 per box.

HONEY

As reported by the Bureau of Markets: Supplies of White Sage, Light Amber and White Orange light, other varieties heavy. Light wire inquiry. Movement very slow, market dull, little change in prices. Carloads f. o. b. usual terms at loading points: White Orange, new crop 12@12½; old crop, no sales reported. Light Amber Alfalfa, old crop 5½@6, new 6@6½; White Sage best 12@12½; Light Amber Sage, no sales reported. Hawaiian White 6, Light Amber 5½.

Beeswax in less than carlots light 30@33, dark 26@28 per lb. Alfalfa crop is now estimated normal, orange 25 per cent and Sage at 30 per cent of normal.

GRAIN AND FEEDS

Grain Exch. price bid July 5:
Corn: Bulk No. 2, Yellow 1.55; No. 2 White 1.60.
Bran: Kansas, 25.00.

HAY

Alfalfa Growers of California report prevailing prices f. o. b., Los Angeles:

No. 1 Dairy	19.00
Standard	16.00

The market situation showed no improvement during the week in the Los Angeles and San Francisco trading centers. Receipts and offerings continued in excess of the current demand, as dealers and users still refuse to buy freely beyond their immediate wants. The main reason is plainly the fact that they want to do such speculative buying at the bottom prices of the year; it is therefore not to their interest to relieve the present depression by taking hold freely, as long as the selling pressure of forced marketing makes it possible to bring prices still lower. In our opinion it is a mistake to lay much of the blame for this situation on the dealers. They simply take the marketing system and the conditions created by it as they find them, and turn them to their best advantage. The system in its present development if unfavorable, in fact ruinous, to the producers, there can be no question about that, but the growers can hardly expect the dealers to change it; in fact we doubt that they could change it even if they were inclined to do so, as such an attempt on their part, if such a thing were conceivable, would spell quick ruin to them; it would mean their "holding the bag" for several thousand individual growers whose actions they could not control. The system can only be changed for the better by the producers for which purpose they must necessarily act jointly, as it cannot possibly be done in any other way; this of course means cooperative marketing on a comprehensive scale. The extent to which they are then benefited depends on the strength of their marketing organization. Clearly such an association will be the more successful the nearer it comes to comprising in it all the growers. Also, the association has a harder task and therefore requires greater strength under adverse financial and economic conditions, such as we are at present going through. In the fruit and grape growing sections of the San Joaquin Valley, which has become one of the important hay marketing centers of the state, the demand showed considerable improvement and resulted in a lively business during the week at prices ranging from $3 to $5 according to locations of growers, above the shipping parity of the Los Angeles and San Francisco markets, which however still leaves prices very low. Normally the heaviest demand there is during the next three months. The alfalfa production in these sections has of late years declined materially from year to year; a large part of that former alfalfa acreage is now in vines and fruit trees, thus largely increasing the local consumption of alfalfa hay while at the same time decreasing the production of it.

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	18.00@26.00
Barley	16.00@24.00
Alfalfa, No. 1 Dairy	18.00
Standard	16.00
Straw	10.00@13.00

San Francisco Markets

San Francisco, July 5, 1921.

Large Whites	3.85
Small Whites	3.80
Pinks	6.60
Mexican Reds	8.00
Red Kidney	9.75
Henderson Bush	4.50
Cranberries	6.60
Bayos	11.25
Bayos	10.50
Blackeyes	8.00

HAY AND FEED

Alfalfa Growers of California state that prevailing prices f. o. b. S. F. are:

No. 1 Dairy	16.50
Standard	14.50

Under date of July 1, A. W. Scott Co. says:

Receipts, 1,318 tons as compared with 1,496 last week. Trade requirements continue limited and arrivals in excess of demand. Country conditions have been excellent for hay curing. Local hay business is a trifle better. Many ships have been moving; building is starting again, and general business is livelier than for some weeks. Alfalfa is dragging badly. Clover hay is so plentiful this year that locally the dairy trade is taking it in preference at the difference in price. Mill feeds are generally lower as the market on coarse feed grains is easier and prices off.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumere charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	15.00@18.00
Wheat Hay, fair grade	13.00@15.00
Tame Oat Hay	12.00@15.00
Wild Oat Hay, new crop	10.00@12.00
Barley Hay	10.00@12.00
Alfalfa Hay, new 2nd cutting	12.00@14.00
Alfalfa Hay, new first cutting	9.00@11.00
Stock Hay	8.00@10.00
Barley, Ground	29.00@31.00

GRAIN

Wheat: Milling, 2.10@2.20; feed, 2.10@2.20.

Barley: Feed, 1.10@1.25; shipping, 1.20@1.30.

Oats: Red Feed, 1.20@1.30.

Corn: California yellow, 1.55@1.60; white Egyptian, 2.40@2.60 per cental; California red milo, 2.00@2.10; Eastern red milo, 1.95@2.00; Eastern kafir, 1.75@1.80.

Citrus Markets

Los Angeles, July, 6, 1921.

There are still a few St. Michaels and Jaffas and occasionally Sweets but most such stock has been cleaned up and Valencias are largely filling the market. Prices are not as satisfactory as earlier in the season but retarded shipment is having beneficial effect.

Lemons are still selling at spectacular prices. The weather has been favorable to lemon sales and growers have done heavy picking and shipments have been large. Delivered prices have been running from $7.50 to $11.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 29,823 cars; lemons, 7,973; total, 37,796. To same date last season: Oranges, 23,801; lemons, 6,167; total, 29,968. From Central California to date this season: Oranges, 6,626; lemons, 206; total, 6,932. To same date last season: Oranges 5,374; lemons, 289; total, 5,663. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

REPORT OF MARKETING COMMITTEE, CALIFORNIA CATTLEMEN, JUNE 25

Beef cattle prices in Chicago and other central markets were the lowest last week that they have been for the last seven years. The Portland market is in a similar condition, and native Oregon cattle are now being sold at Portland. No shipments can be made from California to Portland for the next 30 to 60 days. There is a considerable shortage of beef from Fresno south, and Southern California buyers have bought as far north as Oakdale. Recent prices for steers located in the upper San Joaquin Valley have been reported at 6¾ cents and 7 cents. Heavy cows at Hollister recently sold at 6¼ cents and some as low as 5¾ cents. A sale in San Luis Obispo County has been reported at 5¾ cents for cows and 7 cents for steers. Reports of sales in Tulare County are to the effect that most sales have been at 5½ cents for cows and 6½ cents for steers, although in some cases cows have sold at 5¾ cents and steers at 7 cents.

Your chairman has just returned from a trip East and begs to report: An oversupply of inferior cattle on the Chicago market has had a great deal to do with the slump in prices. The Portland situation is very similar and the cattle are event more inferior in quality. Owing to the closing down of many of the industrial propositions and the resulting idleness, the consumption of beef has decreased very materially all over the United States. Cattle owners in California are far better off than cattle owners in any and all other cattle states in the Union. Don't be too anxious to sell your cattle right now. When you do sell be sure that

they are prime, not half fat. Do not ship on consignment under any circumstances.

The next meeting of the marketing committee will be held July 15, and at that time we will submit report of sales of cattle from the 20 largest cattle counties of the state.—F. H. Bixby, chairman, A. S. Goode, Owen Duffy, C. N. Hawkins, James Barry.

CITRUS CULTURE IN TEXAS

(Continued from Page 27.)

away from the severe winters, a very large proportion of them being induced to buy on the strength of the showing made there with citrus fruits. They are shown the possibilities of the citrus industry but are not made acquainted with the necessity of proper care and frost protection, as a result of which they do not provide for protection and usually lose their first planting of trees. There have been hundreds of thousands of citrus trees planted in the valley, a very large proportion of which never survived the protection, and until the planters are first winter because of a lack of frost made to see that this is the all important requisite there is bound to be a heavy loss of trees.

There is no question in my mind but that citrus fruits can and will be produced in commercial quantities when once the growers make up their minds to give them proper care and equip their orchards with heaters to protect them against the few cold nights that come most every winter.

COMING EVENTS

Frontier Days Celebration, Prescott, Arizona, July 2-5.
North of Bay Counties Fair, Santa Rosa, August 24-28.
Downey Community Fair, Downey, August 25-27.
Yuba County Agricultural Fair, Browns Valley, Aug. 29-31.

Pacific International Livestock Exposition, Portland, Oregon, Nov. 5-12.
Stanislaus County Poultrymen's Association Show, Winter Garden, Dec. 4-7.

SUMMER SESSION AT CHAFFEY

(Continued from Page 45.)

Junior College, Ontario, for three weeks. They are under direction of the poultry division of the University of California. The program for the remaining half of the course is:

Monday, July 11, poultry housing; 12, poultry housing, disinfectants and parasitic sprays; 13, poultry housing, study of appliances; 14, poultry housing, poultry farm accounts; 15, poultry feeding; 16, field trip.

Monday, July 18, poultry feeding, identification of feeds; 19, poultry feeding, study of physical qualities of feed; 20, poultry feeding, condimental feeds, nutritive ration; 21, principles of breeding; 22, principles of breeding, type study; 23, field trip.

Monday, July 25, breeding for egg and meat production; 26, marketing poultry products, selecting the laying hen; 27, diseases of poultry; 28, diseases of poultry; 29 diseases of poultry.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

June 10-20: Contesting hens average for the ten days, 64.2 per cent. Twenty-two of the 54 pens laid 70 per cent and over. Geo. Gray of Santa Cruz leads for the ten days with Alex Stewart of Santa Cruz a very close second.

High pen productions for the ten days were: Geo. Gray, Santa Cruz, 78 eggs; Alex Stewart, Santa Cruz, 77; Warren Wood, Santa Cruz, 76; W. A. Ford, Umatilla, Oregon, 75; S. L. Gibson, Santa Cruz, 75; Hanson's Poultry Farm, Corvallis, Oregon, luma, 74; Walls, 74; Geo. Brenneke, 74; D. B. Walls, Petaluma, 74; Walls, 74; Geo. Brenneke, Santa Cruz, 74; J. S. Conrado, Santa Cruz, 73; Gibson, 72.

AVOCADO ASSOCIATION FIELD DAY

The first general field day of the California Avocado Association will be held at Puente on Saturday, July 30. Arrangements have been made to use the new walnut packing house, the largest in the world, for lunch. Basket lunches will be brought by the members and visitors, and the chamber of commerce of Puente will serve avocado ice cream and coffee. As the avocados for the ice cream have to be picked ten days before they are used, it will be necessary to know in advance approximately how many will be in attendance, and preference will be given to those who notify the secretary ten days or more in advance of their intention to be at the lunch.

After lunch visits will be made to some of the avocado plantings around Puente and demonstrations given of grafting, budding and pruning. Arrangements will be made for the accommodation of those who do not have their own automobiles.

All who are interested in avocados are invited to come and to bring their friends and neighbors, and particularly urged to send a postal card to the secretary of the California Avocado Association, Altadena, notifying her how many will attend.

ANIMAL MANURES WASTED

Are farmers wasteful? It seems so, for according to authoritative figures one-half of their most valuable crop, manure, is wasted each year. The loss amounts to $500,000,000 a year. With proper storage in covered concrete pits or in sheds the loss need not exceed one-third that amount.

RECORDS A GUIDE TO PROPER FEEDING

Beside their value in locating low producers, production records are well worth their cost for other purposes. Too many dairymen feed all cows alike regardless of production, or at most give only a small extra allowance to the heavy producer without any especial thought in the matter, not realizing that a good cow in the early part of her milking period may need two or three times as much digestible food material as the small producer standing beside her or as she herself would need for her diminished milk production near the end of the milking period. The extra feed needed to bring the ration of the heavy producer up to the amount called for in one of the recognized feeding standards will usually pay far better dividends than any other feed used on the farm, and failure to supply it is a real extravagance. On the other hand the heavy feeding of cows which lack milking capacity can result only in waste of feed. A definite determination of the production at approximately regular intervals, and adjustments of the amount of grain fed according to the amount of production would doubtless result in a vast saving of feed and a considerable increase of milk production on most farms where some such program is not already in effect.—Ohio Experiment Station.

WEATHER REPORT

Thought for Food

In food production just as much as in any other industry, the man who succeeds is the one who gives intelligent thought and consideration to each of his individual problems.

This is the reason why so many of the prosperous farmers and ranchers of California have solved their irrigation problems by the installation of

Layne & Bowler Pumps

Sow "Thought for Food" by installing one of the "famous Layne & Bowler pumps" and reap "Food for Thought" in the better crop the dependable water supply will bring.

Our Engineering Service is at Your Command. Use It.

Reputation Gained Through Years of Performance

It is not surprising that there is a downright conviction in the minds of a majority of tractor users that the OilPull is the standard of value in its field.

Nor is it difficult to see just what has formed this intensely favorable attitude. A large number of features in the OilPull stand out prominently over and above anything found in other tractors.

For instance, the OilPull is the only tractor backed by a written guarantee to satisfactorily use kerosene at all loads and conditions up to its brake horsepower. It plows an acre of ground at less cost than any other tractor. For many years it has held the world's tractor fuel economy record.

The OilPull is the only tractor cooled with oil. No boiling—no freezing—no rusting—no leaking—no constant refilling, and no other tractor has the OilPull feature of a double lubrication system.

There are other features which may appeal to you even stronger than these—have us explain them.

Let the SUN give you plenty of HOT WATER

DAY & NIGHT

SEEMS impossible, doesn't it: But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home—mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept. E.

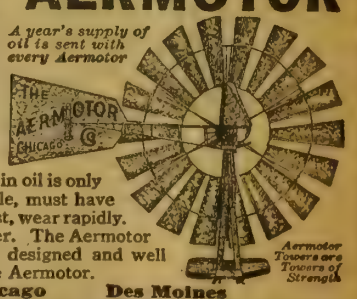
THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

A year's supply of oil is sent with every Aermotor



Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

PROTECT PRODUCERS

Now comes the long fight to secure a permanent protective tariff. The farmers of the country have watched the coming of the fight and have prepared to enter into it as never in the history of the country, and they have entered into it, not with an "if you please," but with a demand for simple justice. This demand, with more or less of an exhibition of the big stick, has resulted in the headlines over the first draft of the bill, stating, "Farmers Given Greater Degree of Protection Than Ever Before."

This is entirely true and yet that is not necessarily saying much as to the degree of the protection. Importing interests assert: "Its enactment would be the ruination of the import business." But delegates from 28 associations of California food producers, in convention assembled at the office of the state market director, recently declared: "It will so boost the import business that American producers will have to stop producing if they do not have to actually beg from door to door."

It is possible both these elements are in the class which may be considered "enthusiastic pessimists," but everyone who is in close touch with the producing interests of California realizes that in some particulars, at least, the enthusiasm of the producing pessimist is not entirely unexplainable.

For instance, beans: California produces 60 per cent of the beans grown in the United States. Expressed in bushels, this state's production has been:

1918 .....8,594,710 bushels
1919 .....5,000,000 bushels
1920 .....2,850,000 bushels

and this year's estimates have it that 1921 will show a production of far less than 2,000,000 bushels. This means that of California's rich acres there are a half million barren of crop, or possibly producing a crop of barley hay infinitely lower in food and financial value than beans.

A part of the eight and a half million bushel production in 1918 was due to the war torn world's cry for food, but that cry will be no less insistent within the next few years unless there is greater encouragement, through profit, or at least production cost, for the food producer.

Now note average seasonal f. o. b. price on Lima beans: 1918, $9.69 per cental; 1919, $10.49; 1920 (so far as the crop has been sold), slightly under $5.00. This, of course, is vastly under cost of production and accounts for the million and a half of barren acres.

What has this to do with the tariff? This, that the island of Madagascar and, on the other side of the world, Manchuria—in both countries labor is practically gratuitous—are large producers of Lima beans which may be transported to American markets at a cost far under transportation charges to California producers. And the protective tariff has been "not a bean." In view of the aggravated situation of the American bean grower having to compete with the Chinese, Manchurian and Korean coolies or with Madagascar negroes, the bean grower deems 2½ cents per pound the lowest possible safety point if the industry is to be saved. The tariff bill grants only 1¼ cents.

The almond grower is offered four cents per pound (unshelled). In view of labor conditions of the Mediterranean countries, the California almond grower insists that 5 cents per pound and 15 cents on shelled nuts is none too high.

The California lemon grower is treated fairly well and has no complaint, but the orange grower, who asks nothing on fresh fruits, still finds it necessary to dispose of wastes of his industry in marmalades and other products. On these there has been a cut of 20 per cent from the former 35 per cent ad valorem duty.

Cotton manufacturers are amply cared for, but the cotton grower now has no protection except that the Fordney emergency act provides for a 7 cent tariff on 1⅜ staple. That will be repealed by the permanent measure which places all cotton and cotton waste on the free list.

These are but hints of some of the discriminations against the producers of food and raiment.

Are not the producers who met in Sacramento and condemned the present bill at least in a measure justified?

The government has so thoroughly protected the transportation companies by permitting rates almost prohibitive that the producer is justified in demanding—and, in fact, his very existence depends on—protection from cheap ocean transportation as well as cheap savage and coolie labor conditions.

And the livestock man is invited to get off the earth — or the American part of it. Duties are levied on articles required by stock men while hides and other stock products are to be free. Shoes in California are still some 230 per cent of pre-war price; the livestock man is getting less than pre-war price so the shoe man must be protected by free hides.

GUARANTEE BEEF

Is it not a good idea to guarantee beef producers, bean producers and some others? The railroads were given a definite guarantee of income on investment. Food is about as important as transportation, but the farmer can go to the devil so far as congress cares.

Listen to this account of an occurrence in the Middle West as reported to us by the farm bureau: "Last October Charles Hunter, an Inavale cattleman, shipped to his feed lots 102 head of beef steers, which cost him $10,810 delivered in his lots, or 10½ cents a pound. He sold them seven months latter on the Chicago market for $10,684, or 7½ cents a pound—a loss of 3 cents a pound—besides having to pay an $892 freight bill for shipping the cattle to Chicago. In other words, Mr. Hunter bought 102,000 pounds of live steers for $10,810 and sold 142,800 pounds of beef on the hoof—just 40,800 more pounds of beef than he bought—for $10,684, taking a loss of $126, a loss of seven months' work, a loss of all the alfalfa and corn he fed these steers, and a loss of seven months' interest on $10,810—a rather heavy penalty for having contributed more than 40,000 pounds of additional beef to feed his fellow countrymen."

If the entire freight bill had been remitted, Mr. Hunter would still be in the hole. We are not endeavoring to lay the entire blame for our present deplorable condition at the door of the transportation companies but we still may call attention to injustice of favoring great corporations and letting the rest of us go hang.

California potato growers are also making a desperate effort to exist till transportation relief is secured. One of them, J. E. Gardner of El Monte, has written Governor Stephens an appeal for assistance:

"We are suffering great losses in marketing our crops because of the excess freight rates. My present crop of potatoes will not pay more than 50 per cent of production costs, and unless we have relief soon will be forced to stop farming."

The governor replies:

"This matter has been recently called to my attention by a great many growers of this state, and in an effort to assist, I appealed to the Honorable Warren G. Harding, president of the United States, on behalf of the American citizens of the state of California engaged in the production of food products, especially those at the present time producing such perishable products as potatoes, in order that these growers might enjoy, uninterruptedly, the splendid success which should be theirs by reason of the great efforts put forward to produce this necessary food.

"I have been assured by President Harding that the matter will be taken cognizance of by the interstate commerce commission, but I have further instructed the officials of the state department of agriculture and state market commission of this state to render every assistance to the growers to the end that an adjustment may be brought about."

ASA W. MORRIS

Asa Warren Morris, one of California's pioneer and greatest livestock breeders, died as the result of an automobile accident on the road to Shasta Retreat last Saturday. Mr. Morris with his wife and a friend were driving up the grade when the car ran off the travelled roadway into soft earth. Mr. Morris helped the ladies from the machine and reentered the car to bring it back onto the roadway. The soft earth suddenly gave way and the machine went over the bank, pinning him underneath.

Mr. Morris was born in Waynesburg, Pennsylvania, May 8, 1857. He came to California in 1879 and with his sons has been engaged in the dairy business and in the breeding of Holstein cattle in Yolo County. His greatest accomplishment in the rearing of great producers began in 1908 when he purchased the pure bred Holsteins of the Pierce Land and Stock Company. The Morris herd attracted attention the United States over at the time Riverside Sadie De Kol Burke began for the ranch the breaking of world's records. Following her came Aralia De Kol, Julianna De Kol, and finally Tilly Alcartra. Mr. Morris' sons have been associated with him in his great work, the business management of the ranch for many years being directed by Frank W. Morris and the feeding of

Asa Warren Morris

the wonderful producers by A. J. Morris.

Mr. Morris was a quiet, unassuming doer rather than talker. He has been a great factor in the upbuilding of California in the production and in the advancement of the interests of pure bred livestock. His work will never be forgotten. His interest in, and even his affection for, the products of his farm was shown long after the stock had been transferred to other farms in California and even other states. This has been shown markedly in the advertising he has written during the past year, which has contained illustrations and given facts regarding animals, the result of Morris' breeding, but now owned by others.

In his life and accomplishments he was a splendid example of the highest type of agriculturist, and his activities can well be called to the attention of the youth of California who may feel that agriculture as a lifework offers small financial possibilities and little of the fame that comes to leaders in other professions.

Asa W. Morris by his life and work was California's most distinguished livestock breeder and a citizen of whom the whole state is justly proud.

COOPERATIVE FIRE FIGHTERS

We all observed fire prevention week with greater fire prevention effort. We suggested in a former Cultivator that we make it a whole fire prevention year.

There are none who go into the mountains and build campfires but should realize the awful losses occasioned by carelessness, but the freedom with which we sometimes leave glowing embers indicates that we are a desperately careless people. Arrests by forest patrolmen and stiff fines by the courts for this carelessness are beneficial reminders, but what California needs is more of real wholesome, hearty interest by its inhabitants in the general welfare rather than a fear of federal or state officials. The unnecessary loss of property, sometimes even loss of life, by fire is appalling. Hardly a country in the world has as many fires as does America, and the one main cause is carelessness. Carelessness in building fires or leaving fields of ripened grain or other combustible crops exposed, carelessness in not equipping for fire fighting, carelessness in not informing ourselves and others as to best methods of using that equipment, carelessness in not urging greatest and most intense cooperative spirit in fire prevention and forest protection, these are causing an economic loss that can never be returned. Let's get busy and cooperate.

California Cultivator

Vol. LVII, No. 3 | Los Angeles, July 16, 1921 | One Dollar Yearly

Western Plant Quarantine Board

THE third annual convention of the Western Plant Quarantine Board held at Victoria, British Columbia, in June, resulted in a general advance in the fight to protect the western coast from the introduction of plant disease or insect enemies.

The resolutions adopted give an outline of some of the expressions of the board. First, owing to the retirement of Director Hecke of the state department of agriculture from active quarantine work, he withdrew from active participation in the work of the plant quarantine board. This called forth regrets on the part of the remaining members and a resolution "that we, the members of the Western Plant Quarantine Board assembled in its third annual convention, elect the Honorable G. H. Hecke to honorary membership in the Western Plant Quarantine Board."

There were heartiest expressions of appreciation to the premier of British Columbia, the provincial department of agriculture, the press, the astro-physical observatory, the Dominion experimental farm and the department of agriculture of the state of California for courtesies extended, to the federal agricultural board for information and assistance generously furnished and to Messrs. Hecke and Lyne for program prepared.

It was urged that colonization agents for various railways be invited to attend all meetings of the board, this with the idea of securing heartiest cooperation from these large interests in protecting agriculture and horticulture.

Federal Quarantine

"Whereas the federal horticultural board and the U. S. bureau of plant industry have shown the Western Plant Quarantine Board the inestimable value of close cooperation in our work, and whereas tangible benefits and increased efficiency have been mutually derived from such association in our cooperative work, and whereas the same serious pests continue prevalent in other states: Be it therefore resolved that the Western Plant Quarantine Board express its approval of the generous cooperation given in the past two years, and be it further resolved that the federal horticultural board and the U. S. bureau of plant industry be urged to maintain their present policy of close cooperation and to extend their assistance as financial considerations permit."

A committee was appointed to codify the present quarantine law of various western states, Hawaii, British Columbia and Lower California because "there is a decided lack of uniformity in the now existing plant quarantine laws and rules of the western states, which presents material difficulties to the various state quarantine officers in giving the best and most efficient service and also places a most difficult task upon the transportation organizations of the Pacific Coast to properly comply with the provisions of the various state plant quarantine laws and rules."

Laxity in the enforcement of Federal Quarantine No. 26 against blister rust of the white pine, and in the interstate shipment of white pine trees, currants, gooseberries and other host plants was condemned in extended resolutions. It was resolved that the states west of the Mississippi unite in maintaining quarantine against any state not enforcing Federal Quarantine No. 26.

Furthermore, that efforts be made in cooperation with the federal horticultural board to secure the exact listing of contents on the outside of all packages containing plants or plant products in interstate commerce and that steps be taken to file such information relative to interstate movement of plants as a precautionary measure in pest control.

"Be it further resolved that this board commends the work of the federal offices of forest pathology and blister rust control and urges the continuation of their work with more adequate appropriation to permit of effective protection of the forest resources of the West, as well as continuation of research, experimental and demonstration work for control of the blister rust in the Eastern infected regions."

"Whereas the federal horticultural board and the U. S. bureau of plant industry are rendering highly valuable service to the Western state quarantine officers in the examination of nursery stock in transit at railway mail terminals and express and freight transfer points, be it resolved that this board urges the continuation of such federal inspection and requests that the proper Western state inspectors be notified of all plant shipments observed in transit to Western points and that any shipment passing through in violation of federal or state quarantine laws be suitably tagged."

Attention was called to the fact that Australia has placed an embargo on the shipment of fruit or nursery trees of pears to any of the Australian states. This because of fire blight. And it was resolved "that said departments of agriculture be respectfully requested to initiate and carry out, without delay investigations to determine whether or not any danger exists of the fire blight organism (Bacillus amylovorus) being carried to Australia in a viaible condition in shipments of fruit with a view to obtaining a modification of the embargo as relates to fruit, in case no such danger shall be found to exist."

Because of the danger of introduction of fungus blight of the filbert, which does not now exist on the coast, it was resolved that the federal horticultural board of the United States department of agriculture make an immediate investigation and take such steps as may appear necessary in order to prevent the introduction of this disease on the Pacific Slope.

The New California Standard Apple Act

By S. V. Christierson, State Department of Agriculture

IN August 3, 1921, the Standard Apple Act of 1917 will be superseded by the new "California Standard Apple Act" passed by the 1921 legislature. Although in most respects very similar to the former apple law certain changes have been made which should be noted by growers, packers and shippers interested in this particular industry.

The principal changes in the requirements of the "California Fancy" grade are that the tolerance of defect for apples within a given container has been increased from three to five per cent. The tolerance of total defects of all kinds remains at ten per cent. This increase was considered necessary as a three per cent tolerance was hardly sufficient for practical purposes and could not be rigidly enforced. It is the intention of the standardization service to strictly enforce this five per cent limit on tolerance. Another important change in the requirements of the California Fancy grade is the removal of the 2¼ inches minimum diameter. Under the new act any apple, no matter how small, if meeting all other grade requirements, may be packed as "California Fancy." The requirements as to uniformity in size within the same container as described below must, of course, be complied with, in addition. Instead of requiring that stems be retained in all apples packed in California Fancy grade, with the exception of Gravensteins, the much simpler requirement that no apples with skin broken at stem may be packed in this grade has been substituted.

In the "B" grade the most important change is the permit to pack apples showing scab spots not larger than one-fourth of one inch in diameter in the aggregate. This conforms quite closely to the apple standards of the Northwestern states. The tolerance of defects has been increased from three to five per cent as in the California Fancy grade.

The same changes regarding scab spots and tolerance of defects have been made in the "C" grade as in "B".

All apples should be packed in the standard box of the following dimensions, inside measurements: Depth 10½ inches, width 11½ inches, length 18 inches, and having a cubical content of as nearly as possible 2,173½ cubic inches. Other containers, "California Box," the pear box, lug boxes, etc., may be used if marked in letters not less than one-half inch in height, "Irregular Container." The practice of marking this legend on boxes in type ranging from one-eighth to three-eighths inch in size will be discouraged, and boxes not properly marked will be held until proper markings are affixed.

The following markings are required on each box of packed apples:

Name and address of grower.

Variety.

Grade.

Date of packing.

Number of apples in box, or net weight.

Tier markings may be employed at the option of the packer or shipper providing that the tier markings correspond to the following minimum diameters: 3½ tier not smaller than 3⅛ inches; 4 tier not smaller than 2⅝ inches; 4½ tier not smaller than 2¼ inches; 5 tier not smaller than 1⅞ inches.

Under the new act a close check will be made to note that tier markings correspond to these sizes as prescribed under Section 3, subsection B of the law. Apples not meeting size requirements as labeled will be considered packed in violation of the statute, and apples smaller than the size indicated by tier markings will be considered as defective apples and below the tolerances prescribed for defects.

It should be noted that apples infested with insect pests (wormy apples) can only be sold for the express and sole purpose of manufacturing the same into apple by-products, although the grower may sell such wormy or diseased apples as part of his crop in bulk to a packer or may himself manufacture such wormy or diseased apples into apple by-products, such as cider, vinegar, dried apples, etc. It should also be noted that it is unlawful to import any infected or infested apples from outside the state of California, for any purpose whatsoever.

A new provision of the law specifies that "on each container of apples which has been held in cold storage for more than 15 days after being packed a statement showing the fact that the contents have been held in storage" must appear.

The director of agriculture is charged with the enforcement of the California Standard Apple Act, and for that purpose has the power to

(a) Enter and inspect every place within the state of California where apples are produced, packed, shipped, delivered for shipment, offered for sale, or sold, and to inspect such places and all apples and apple containers and equipment found in such places.

(Continued on Page 54.)

Agricultural News Notes of the Pacific Coast

Northern California

Almond buyers are offering growers 18 cents for new crop Nonpareils.

Contra Costa farmers are in the midst of another squirrel poisoning campaign.

Graders are at work on the Coyote Valley section of the Ukiah-Tahoe highway.

Colusa County fruit and vegetable growers report some damage by heavy north winds.

The Butte County farm bureau is planning to build community cold storage houses.

Movement of cattle and sheep to mountain ranges still continues from Butte County.

During the month of May the port of San Francisco carried on foreign trade with 62 foreign lands.

Eighteen peach orchards have been entered in the Sutter County farm bureau peach growers contest.

Alameda County farm bureau has appointed A. J. Garin secretary-manager and marketing manager.

A poultryman's picnic will be held August 2 at the poultry demonstration plant of the Alameda County farm bureau.

Gas rates in Northern California have been cut by the state railroad commission six cents to ten cents per thousand cubic feet.

Over 100 farmers of Glenn and Colusa Counties met at Willows, July 2, and effected an organization to protect their lands from damage by seepage from rice fields.

Fruit growers of western Oregon are becoming much interested in apricots. A considerable acreage of apricots is signed up with the Oregon Growers Cooperative Association.

Thirty cents an hour, with a ten hour day, and a maximum rate of ten cents a box for piece work in the present fruit season, have been established as the wage scale for farm and field labor in Alameda County.

The last of the state university experiment station herd of 430 head of cattle was taken from Shingle Springs, Eldorado County, to summer range on Peavine Ridge, on June 15. All of the cattle were weighed and tagged prior to being taken away.

Horticultural Commissioner Mills of Butte County estimates fruit crops: Almonds, 35 per cent; figs, 100 per cent; grapes, 90 per cent; olives, 60 per cent; oranges, 100 per cent; peaches, 30 per cent; pears, 55 per cent; prunes, 50 per cent.

The joint irrigation committee of the Yuba County farm bureau and chamber of commerce has issued warning to farmers of southern Yuba County that prompt action must be taken to insure irrigation rights from the Yuba River because of the numerous filings made by Nevada County land owners.

A farmers' public market has been established at Tenth and Market Streets, San Francisco, by orchardists of Santa Clara County. The plan is to sell with the fruits sugar and preserving jars at cost as an added inducement to the housewives of San Francisco to purchase quantities of fruit for preserving.

Central California

Delano, Kern County, is shipping watermelons.

Rosedale, Kern County, is discussing formation of a mutual telephone line.

Turlock growers of cantaloupes are urging strict enforcement of standardization.

The County Supervisors Asociation of San Jauquin Valley met July 2 at Bakersfield.

Hog auction sales will be held in Kern County at Bakersfield, July 16; McFarland, 29.

Many apricot growers in the Kerman district of Fresno County are drying their own fruit.

Mrs. George Robinson of El Nido is the new home demonstration agent for Merced County.

The Kings County cannery is in full swing on apricots, 300 women and 170 men being employed.

Turlock watermelon fields are marketing rather later than usual because of the cold, late season.

Most of the apricot growers of the Hughson district of Stanislaus County are drying their own fruit.

The boys agricultural club at Shafter, Kern County, has nearly finished its potato growing contest.

At the recent annual meeting of the California Peach and Fig Growers at Fresno all officers were reelected.

Horticultural Commissioner Haupt of Kings County estimates shipment of 300 carloads of Elberta peaches.

Storm waters will be turned into Dry Creek next winter to avoid congestion at the Fresno city sewer farm

Kern County farm bureau held dairy improvement meetings at Wasco high school July 7, and at Panama school July 8.

The shipment of fresh figs to Chicago brought 30 cents a pound June 28. The fruit arrived in first class condition.

The Fruit Growers of California named prices on canning apricots June 25: No. 1 fruit (14 to pound), $80 per ton; No. 2, $65.

Farm home department meetings will be held in Kern County at Weed Patch, July 19; Inyo-Kern, 22; Kern-Delta, 26; Wasco, 28; Edison-Fairfax, 29.

Kern County farm center meetings: Mountain View, July 18; Pond, 20; Inyo-Kern, 21; Rosedale, 22; Shafter, 27; Arvin, 29; board of directors at Bakersfield, 30.

The Apricot Growers Association membership at Hughson, Stanislaus County, is marketing 400 tons of apricots. The prices set are $52.50 a ton for Tiltons and $50 for Blenheims.

The newly published census report for 1920 shows Kern County ranking sixth in the 58 counties of California in percentage of gain in value of farms and farm lands in the ten year period from 1910 to 1920.

Fresno has been selected again as international headquarters of the International Union of Fruit and Vegetable Workers, which claims a membership of over 2,000 in the principal fruit centers of the United States and Canada.

Southern California

The Salton Sea has fallen six inches since April 26.

Palo Verde Valley made shipment of Malagas, July 4.

Ventura lemon growers are happy over the hot weather prices.

Riverside County's playground at Idyllwild is proving very popular.

Hemet, Riverside County, is planning to build a community theater.

The Oxford sugar factory is expected to start slicing beets July 30.

Santa Ana reports sale last week of a ten acre orange grove for $60,000.

A bean pool for Red Kidneys and Blackeyes has been formed in the Ontario-Chino district.

The Orange County farm bureau is discussing advisability of having a home agent appointed.

The community picnic of Covina Valley at Ganesha Park, Pomona, was attended by 850 people.

Downey, Los Angeles County, will hold its community fair, August 25-27. H. Koopman is secretary.

Escondido, San Diego County, is considering an ordinance prohibiting keeping of goats in city limits.

The Ventura County supervisors have decided upon the Dennison route for the permanent Ojai grade.

Harvesting of milo in Imperial Valley will begin the latter part of the month with few buyers in sight.

Orange County reports walnuts sizing up in fine shape, with very little blight and few worms in evidence.

Supervisors of Orange County have awarded contract for building a new bridge across the Santa Ana between Olive and Richfield.

The home department of the Apple Valley farm center at its June 30 meeting took up dressmaking under direction of State Specialist Miss Decker.

Over 4,000 acres of Blackeye beans have been signed in the Irvine marketing pool. It is expected that at least 10,000 acres will eventually be signed up.

The Palo Verde Cotton Association has completed plans for the pooling of this season's crop. All its gins have been overhauled and are ready for work.

The rush of work in Orange County apricot orchards began after The Fourth. Canneries have taken so little of the fruit that many are drying their own.

Three hundred employees of the Santa Paula Citrus Association are busily rushing into the market all available lemons to meet the present Eastern demand.

"Yucca hounds" is a suitable designation for the Sunday autoists who are denuding the hillsides of the stately blossom stalks. Protests are coming from public spirited citizens all over the south.

The Antelope Valley Alfalfa Growers Association has petitioned the railroad commission for reduction of freight rate to Los Angeles. The present rate is 19½ cents per cwt., while the rate from Bakersfield to Los Angeles, over twice the distance, is 24 cents.

The Coast and General

Klamath County, Oregon, has a new cow testing association.

Oregon cherry growers are getting 3½ to 4 cents from canners.

Raymond, Washington, cranberry growers are asking appointment of an inspector.

Southern China exports considerable quantities of oranges to all points in the Far East.

The prune crop is light in the Walla Walla district of Washington owing to the wet cold spring.

The Oregon Growers Cooperative Association now has a membership of 1,806, controlling 30,781 acres.

The Siamese government has discontinued its board of rice control and rice may now be freely exported.

Arrangements have been made for holding a community fair for western Lane County, Oregon, at Florence next fall.

All animals offered for sale by members of the Oregon Jersey Cattle Club will carry the guarantee of the association.

The Oregon Growers Cooperative Association has signed up 1,000 acres of fruit and berry land in The Dalles district.

It is estimated that acreage planted to clover in Marion and Polk Counties, Oregon, is 250 per cent greater this season than last.

At the recent annual meeting of beekeepers of Marion County, Oregon, G. A. Bock of Silverton was elected president and W. H. Bowers of Willard, secretary.

Three million bushels of wheat have been signed in North Dakota to be marketed through the United States Grain Growers, Inc., practically all of it being pooled.

Berry growers in the Chehalis section of Washington will this year try the experiment of sending refrigerator cars loaded with berries into the larger Eastern markets.

Frost warnings will again be sent out by the U. S. weather bureau to orchard districts of the Pacific Coast. A $9,000 appropriation for this purpose has just become available.

The Cuban government has purchased 1,000,000 tons of sugar to withhold from the market as long as necessary. The amount of sugar on hand in Cuba is stated to be 2,000,000 tons.

Northeastern Washington's 1921 apple crop, based on present conditions and prospects, will exceed any previous crop by 15 to 20 per cent, with Spokane Valley showing the largest increase.

In his address at Oregon agricultural college during farmers week Organization Manager Ward of the Oregon Wool and Mohair Association stated that 18 state wide wool marketing associations are now in operation.

During the month of May 3,144 cows were tested in the six Oregon cow testing associations. The average yield of milk was 986.6 pounds and of butterfat 39.47 pounds. This is the highest average yet reached in the tests.

Shade for the Cows

By R. P. Royce

THERE is a close and direct relation between the physical comfort of dairy cattle and the milk or cream check, and if the cow owner is interested in the latter he must concern himself with the former, else his pocketbook will suffer along with his bovine charges.

It should not be necessary to call attention to the need in California for some sort of shade for livestock, but a trip through many of the principal producing sections gives one the impression that many owners place undue value on our California sunshine. To imagine that a cow can do her best when confined in a dry lot with no more shade than is afforded by an alfalfa rack is a reflection on the intelligence of the owner and a sad commentary on his humaneness. Yet in many sections of the state hundreds of dairy cows are forced to stand all day in the pitiless rays of the summer sun with the further aggravation of flies.

Such a condition might be excused in a measure if it were not possible to provide the needed shade at small expense. In nearly every section of California some variety of shade tree will make rapid growth and with reasonable care can be made to furnish ample shade in summer and protection from raw winds in winter.

The method of providing shade makes little difference. Trees planted around the barn lot and protected while small from the cattle furnish the cheapest method. A cheap shade can be secured by covering a shed frame with hay, straw, brush, palm leaves or bamboo.

If protection from rain and mud is wanted the type of shed illustrated has proven highly satisfactory at the university farm and on numerous other ranches. The cost of such a shed is not great as compared to the comfort of the cows in summer and winter, and it is capable of demonstration that such a shed will pay for itself through the increased production of the cows.

A shed of the type shown can be made to accommodate any size herd by adding additional units to the sides or increasing the length. By running fences through the shed two or more lots can be protected. If a concrete floor is put in it will add to the comfort of the cattle in the muddy weeks of winter and spring.

Aside from furnishing much needed shade trees add much to the attractiveness of the ranch, a fact that is too little appreciated by many California ranch owners.

Cow Comfort in Summer and Winter

This shed has proven a valuable adjunct to the dairy equipment of the University Farm, Davis. The original plans were worked out by the Hopland Stock Farm.

Sweet Clover in Arizona

By S. P. Clark, Assistant Agronomist, University of Arizona

SWEET clover is one of the oldest forage crops known, but it is only recently that it has been appreciated or used to any extent for hay and pasture in this country. Some of the reasons for its lack of popularity are the tendency to become a weed on untilled fields, the refusal of stock to eat the hay readily until they become accustomed to the bitter taste, and the tendency of the plant to become woody as it approaches maturity.

During the last few years the value of sweet clover as a soil renovator has been demonstrated and the acreage for this purpose is increasing very rapidly. Likewise the value of the crop for hay or pasture has been proven, and at the present time it is being grown in practically every state. In Arizona it has a place in short rotations or where alfalfa cannot be grown successfully.

Varieties

There are four important varieties: Biennial White (Melilotus alba), Biennial Yellow (Melilotus officinalis); Annual Yellow (Melilotus indica), and Hubam clover, an annual white variety. This discussion applies primarily to Melilotus alba, which is the variety most commonly grown, most highly advertised and best known.

The biennial white sweet clover plant has an erect, stemmy, branching form of growth, the stems being only moderately supplied with leaves. The first season it makes a growth of 15 to 30 inches in height, but during this period it is developing a long, strong root system and storing up reserve plant food for rapid growth and for seed production the second season. The young sweet clover plant resembles young alfalfa but can be distinguished by its bitter taste. During the second season it will make a growth of from three to ten feet, depending upon moisture and soil conditions.

Sweet clover is adapted to a wider range of climatic conditions than most of the true clovers. All varieties are used for green manure and all of them are excellent honey producing plants and are quite extensively used for this purpose.

The large growing, yellow flowered biennial variety is similar to the biennial white flowered variety, but it has a more spreading, prostrate habit of growth. The mower is likely to pass over the lower branches, and these being left to form seed for further propagation, it may, if in a mixed meadow, increase to such an extent that it will crowd out other plants and thus become objectionable. This variety blooms one or two weeks earlier than the white flowered variety and is often used to supplement the latter as bee pasture.

The small annual yellow flowered sweet clover, commonly known in Arizona as sour clover, is a low growing, erect type of plant. It is used extensively in some parts of California as a winter cover crop for orchards and for green manure. It becomes a pest sometimes and has been considered a weed in wheat fields in the irrigated valleys of the state.

Hubam, annual white flowered variety found and propagated by the Iowa experiment station. This variety is coming into general use in some localities. It is claimed to be especially valuable in short rotations and for bee pasture.

Soils

Sweet clover thrives on most of the principal soils of the United States—adobe, granite, gumbo, hardpan, prairie, and heavy clay. It does not thrive on very dry sandy soils, although it does well in sandy ground if plenty of moisture is present. It does not thrive on an acid soil.

Sweet clover thrives on soils that are too alkaline for small grains or alfalfa. However, it frequently happens that after sweet clover has been grown on such soils for a few years they can be planted to alfalfa with good success. Sweet clover will generally survive in ground where salt grass is growing naturally and will furnish a more satisfactory pasture. There is, however, a limit to the amount of alkali it can stand and make a profitable return.

The large tap roots of sweet clover will penetrate tight or compact subsoils and loosen them, thus enabling crops that follow to increase their feeding area. The large tap roots decay very quickly after the plants die, and the open spaces left by this decay improve the drainage and aeration of compact soils.

Seeding

Low germination is frequently due to hard seed (seed having a hard outer coat), which does not permit water being absorbed in sufficient quantity to cause germination. Because of this fact all seed should be tested before planting. The per cent of germination of hard seed can be greatly increased if the seed is subjected to alternate freezing and thawing. This is the reason why seed that gives a low germination in the tester will often give a high germination when planted in the fall and allowed to lie in the ground during the winter months. Some seed houses scarify the clover seed before selling. This usually is done by blowing the seed with great force against sandpaper, which scratches the seed coat, enabling it to absorb water more readily.

Sweet clover is very similar to alfalfa in its seed bed requirements. It must have a well settled, firm seed bed with enough loose dirt to cover the seed. Where the planting is to follow an intertilled crop and the ground is free from weeds, disking will be sufficient. The soil should be well filled with water before planting.

In the warm valleys of Southern Arizona, or other localities of similar climatic conditions, seeding has been successfully accomplished from October 1 to April 15. However, the best time is probably in late January or in February. In higher altitudes fall or spring seeding rather than winter seeding is advisable.

Where the seed bed is in first class condition and the seed is known to be of good quality, 10 to 15 pounds of seed per acre is sufficient. With a poor seed bed, or if the seed is of uncertain quality this amount should be increased.

When possible to use it, the best method of seeding is with the press drill. This covers all the seed to a uniform depth. Very good results may be secured by broadcasting and harrowing in. This method will require more seed than if a drill be used. The method used in seeding alfalfa will be suitable for sweet clover in the same locality. Nurse crops are not necessary and usually they are not desirable.

Cutting

In sections where only one crop is to be harvested the first season, it may be left until it reaches its maximum growth in the fall. When two or more crops are to be harvested the first year the first crop should be cut when the field has made an average growth of 30 inches. The second season the hay crop should be cut before the flowers appear and the stems become woody.

The new growth (after the first cutting) of the first year is produced from buds on the crown of the plant. The first cutting should be delayed until the plant is old enough to have formed these buds. Sweet clover should be cut for hay before the plants bloom and the leaves begin to shatter.

The first crop the second year comes from crown buds. The new branches which produce the second crop of the second year are produced from buds formed in the axils of leaves left on the stubble.

When cutting the first crop of the second year the sickle bar should be set at a height that will leave sufficient buds on the stubble to produce the next crop. It is very important that sweet clover growers observe the statements in the above paragraph.

Curing

Sweet clover is more difficult to cure than red clover or alfalfa, as the leaves are likely to shatter before the stems are cured. The leaves contain the greater per cent of the food value and every precaution should be used to retain them. A successful method of handling the hay crop is to rake as soon as the plant is well wilted, or early in the morning while the dew is still on. It should be cocked immediately after raking, leaving in

$100 Buys This
Pedestal Bath Room Set
Guaranteed Perfect

One of the most popular three-piece bath-room sets. Includes your choice of 4, 4½ or 5 feet porcelain enameled tub, low style white toilet with birch-mahogany seat and nickel plated post hinges, and high grade porcelained enameled pedestal lavatory. Just as you see it in the picture.

Both the lavatory and bath tub are equipped for hot and cold water, with No. 1 nickel plated fittings. Toilet is complete with angle valve screws and washers. Everything fully guaranteed Grade "A" quality. All complete to the rough plumbing, ready to install, $100.00.

FREE

—On all orders for this Pedestal Bathroom set placed before August 1st, 1921, we will include, free, one white enameled towel bar and one toilet paper holder, with necessary screws to install.

Fuller Balls, Doz. 20c
Washers for Fuller Faucets, ⅜ and ½-inch sizes.

THE NEW CALIFORNIA STANDARD APPLE ACT

(Continued from Page 51.)

(b) Provide a uniform method of stamping or otherwise marking or identifying packages of apples which have been inspected by him or his deputies or inspectors. (New.)

(c) Appoint, superintend, control and discharge all apple inspectors and fix their compensation.

(d) Seize and retain possession of any apples packed or sold in violation of the act.

(e) Prosecute violators of the act, and institute condemnation proceedings on apples packed in violation of the act.

(f) Issue certificates of inspection.

(g) Establish, promulgate and enforce rules and regulations governing the inspection of apples, and the use of apple stamps.

For the privilege of affixing to or using upon any container of apples the stamp or other designation provided by the director to identify apples which have been inspected by a duly authorized state inspector there shall be paid to the department of agriculture three-fourths of one cent for each container bearing such stamp or designation. Such stamp or mark shall not be affixed to any container of apples which has not been inspected, or which is not one of a unit of like containers so inspected. The use of a facsimile of such stamp or mark not manufactured for or by the department of agriculture cannot be used, in fact it is a violation of the act to employ any stamp or mark which in any manner infringes on the state's prerogatives in this respect, and is a misdemeanor.

For any violation of the California standard apple act the law imposes a minimum fine of $50 and a maximum of $500 and imprisonment for six months or both.

Any common carrier, railroad company, express company, etc., is specifically given the right to refuse to ship any apples which have been rejected by inspectors for being packed in violation of any of the provisions of this act and may at the risk and expense of the consignor return to the consignor or hold such shipments.

Apples may be sold loose in lug boxes or other containers, if meeting at least requirements of C grade. This means that such apples must be free from worms (codling moth) or decay. Containers of loose apples need not be marked in the same manner as packed containers, in fact no container markings are required. It should be observed, however, that if there is any placing or facing of the apples within a given container or attempt at a regular compact arrangement, such apples shall be considered packed within the meaning of the act, must meet all requirements of the law, and containers of such stock must be marked in accordance with the terms of section 3.

THE ALMOND TARIFF

Bankers and business men have been awakened to the dire financial consequences to the state if duties on almonds as proposed in the tariff bill now on the floor of the house are not revised. They are wiring California representatives and senators and members of the house ways and means committee, pointing out that almond growing in California, which will be worth $15,000,000 annually to the state within the next two or three years under adequate tariff schedules, will disintegrate if the bill is not amended. William H. Crocker, president of the Crocker National Bank of San Francisco, sent the following telegram to members of the house ways and means committee: "Am convinced committee has erred in recommending four cents tariff on unshelled almonds and eight cents on shelled. Ratio should be three to one, which is natural shelling ratio of almonds. If allowed to stand proposed schedules will work serious harm to California financial interests, not to mention virtual destruction of industry. Three hundred thousand dollar shelling plant in Sacramento now closed. Won't you stretch point and revise almond schedules on three to one basis at this late hour? One hundred thousand acres of California soil on which are planted seven million trees are at stake. California growers simply cannot touch American market for shelled almonds representing 80 per cent of demand now in hands of European growers with eight cent schedule."

Sixty thousand California farmers ranged themselves behind the almond growers at a meeting in the offices of State Market Director Maddox at San Francisco. The representatives of their cooperative organizations framed a set of resolutions and a telegram to members of the ways and means committee of the house and the California congressional delegation stating: "We view with greatest concern reported tariff schedules announced when we had been positively assured of schedules that would protect our basic agricultural industries, which the reported rates fail to do." The telegram contained a demand for immediate revision.

A NEW AVOCADO

Two fruits of a new variety of avocado recently found their way to the editorial rooms of the Cultivator and, when ripe, were duly consumed by the appreciative epicureans who lie in wait for just such dainty morsels.

But we will not lie in weight. The fruits weighed 18 ounces each, the seed of one was a scant ounce, of the other seven-eighths of an ounce! The flavor was of the best, fiber none, shell thin, scarcely more than a hard skin. The color of the latter was a

Thompson Avocado

rich chocolate brown, shading to purplish tints. The fruits run to a pound and a half in weight and ripen from February 1 to April 1. All remaining will fall off by June 1.

The history is of about 40 seeds sent from Atlixco, Puebla, Mexico, whence came the Fuerte, Puebla and Atlixco avocados. The seeds were from one tree, known to bear the smallest seeds, compared to size of fruit, of any tree at Atlixco. Eighteen of the seeds grew and produced trees, now eight years of age. Our subject, this, its first year of fruiting, produced 44 good fruits; one other tree bore one. The remaining 16 are yet to demonstrate crop performance. The tree is said to be a little hardier than the Fuerte, certainly a strong recommendation. The owner has no stock of budded trees or buds for sale at present. This most excellent and promising variety has been named Thompson.

WORMS DESTROYED

The worms that do so much injury to currant and gooseberry bushes at this time of year are very easily destroyed by an application of white hellebore, which may be obtained at any drug store. Use one ounce of the powdered hellebore to a bucket (about three gallons) of water and thoroughly spray the bushes.

Many Insulators!

What different kinds of materials make good electrical insulators? Rubber, glass, porcelain, wood and *numberless* others! There are in fact dozens of such insulators found in nature that meet all the *usual* requirements. But—

A Few are Porous!

In a storage battery the insulators must be *porous* to let the battery solution circulate freely. How many materials that are good *insulators* are also sufficiently porous? Of these, how many also are *durable* enough so that the battery will never have to be *re-insulated* during its life? Not one such *natural product* is known. But—

One is Durable!

Why not take one of the materials that is a good insulator and is durable —*and make it porous?* It has been done! The result is Willard Threaded Rubber Insulation. Willard started with RUBBER and *made it porous*, by piercing it with thousands of threads. The Willard Threaded Rubber Battery does not have to be re-insulated during its lifetime.

You can buy the Willard Threaded Rubber Battery of any of the dealers in your territory listed below. They all give authorized Willard Service:

SHASTA COUNTY FARM BUREAU FAIRS

The Shasta County Farm Bureau Fair will be held October 6, 7 and 8 in Anderson. The president is S. G. Roycroft, Anderson; secretary, Mrs. Wm. H. Formey, Anderson.

The Fall River Fair will be held September 7, 8 and 9 at McArthur. Our county is so large and divided by mountains, so the farm bureau holds two fairs.

One of the features of the fair in Anderson this year is our "Pork Day," when ten farm bureau centers will have ready for auction a carload of fat hogs, each center competing for prizes. This is being held to stimulate interest in better hogs in the county. October 9 will be Pork Day. —Shasta County Farm Bureau Fair, Mrs. W. H. Formey, Secretary.

BARK-GRAFTING AVOCADOS

E. E. Knight of Yorba Linda, Orange County, is topworking his Rey avocado trees through bark-grafting in the large trunks of nearly a foot in diameter, a method in which he appears to have decided success. He believes that while some trees require more than one graft there is a decided advantage in growing a new top from one central graft. He says: "In this way I can get a better balanced tree." Farm Adfiser Hodgson of Los Angeles County and the writer recently visited the Knight orchard and saw some of these grafts but a month or a few weeks old that were more than a foot high, well foliaged and of figorous growth.—E. B.

CALIFORNIA HORTICULTURE EXHIBITION

The advance schedule of premiums is out for the California Flower and Horticultural Exhibition to be staged by the California Association of Nurserymen, at Exposition Park, Los Angeles, October 20, 21, 22, 23. After pages and pages of ornamentals we come to fruits in the deciduous and ornamental classes, both hardy and subtropical. In oranges alone there are prizes offered for 26 named varieties, seven of lemons, six of limes, four of pomelos (the name grapefruit is not used), and four odd citrus fruits such as tangelo, citrange, bun-tan and citron. Then come lists of avocados, dates, jujubes, Natal plum, Brazilian cherry, carob, feijoa, cherimoya, sapote and mango. The last division of entries is for trees of these kinds and sorts. It is evident provision has been made for the largest and most varied flower, fruit and plant exhibit ever attempted in Western America. "All California" is some field to draw from.

SPRAYED APPLES PRODUCE BEST FRUIT

When apples on sale show evidence of having been sprayed, they are probably good apples, say specialists in the bureau of plant industry. A vigorous campaign is being carried on by the department among fruit growers to show them that by proper spraying they will develop the finest quality of fruit, free from plant diseases and insect pests. Similar attention to spraying some vegetables must be given to assure the best results. At the same time that the consumer is urged to demand sprayed apples, tomatoes or celery for his own satisfaction, it is recommended that all market supplies be thoroughly washed before they are either cooked or eaten raw. This is important not only because of the likelihood of contamination which the food has undergone through street dust and handling but for the sake of removing any spray residue which may remain.

GROW OUR OWN FIGS

Progress made in growing and packing California figs bids fair to sound the knell of the foreign fig in the United States, according to E. S. Moorhead, chief of the food division of the California Peach and Fig Growers, who returned this week from a two months tour of Eastern markets. Moorhead bases his prediction on the tremendous interest buyers in the East are taking in the California fig.

"The East has awakened to the food value and delicious qualities of this fruit," says Moorhead. "They realize back there that the industry is new yet by demonstrating this fall that California can produce a fig equal to any grown anywhere, the sentiment in favor of buying American figs can be utilized to build up the state's infant industry."

Mr. Rixford recently told us that he had learned of an incident where California cured figs were submitted to fig experts in Asia Minor and they declared they were produced in Smyrna. When told they were California produced they declared that large Smyrna exports to America would ultimately end.

DATES IN LOWER CALIFORNIA

While dates are grown to a small extent all over Lower California, the center of date culture is probably San Ignacio. This little town of some 700 inhabitants, situated at the center of the peninsula, can be reached from San Ignacio Lagoon, 40 miles away on the Pacific, or from Santa Rosalia, a port on the Gulf of California 66 miles away. Dates from San Ignacio are marketed exclusively in Mexico, since they are not dried or packed in a manner that would be pleasing to American tastes.

The local price ranges around two cents gold per pound. Since these dates are of a superior quality, it is likely that if handled by modern methods and put out in attractive containers they would find a ready market in the United States. Date brandy and date preserves are by-products. The brandy finds a ready market in Lower California, and the preserves are consumed locally. In 1920 Swiss and German interests installed a drying oven, but the experiment was not a success.

SWEET CLOVER IN ARIZONA

(Continued from Page 53.)

the cock for several days, or until the stems are thoroughly curred, when it may be stacked. The cocks should be small in order to avoid tearing apart in handling, as this causes unnecessary shattering of leaves.

When cut at the right time and properly cured, sweet clover hay is relished by all classes of livestock. When it is fed to growing stock the gains in weight compare favorably with those secured when alfalfa is used. Occasionally it is necessary to force animals to acquire a taste for the hay, but usually this is not the case.

Silage

When allowed to become well matured sweet clover makes good silage. If it is too green to put in the silo, it may be ensiled by mixing dry fodder or straw with the clover. This extra dry matter will absorb the excess of moisture and a very good silage will result. However, it is not recommended that sweet clover be grown primarily as a silage crop.

Pasture

Sweet clover makes first class pasture for all kinds of livestock. Cattle, hogs, sheep, horses and chickens relish it after the taste for it has been acquired. The easiest way to develop the appetite for sweet clover is to begin pasturing in the spring before other green feed is available. This crop has one advantage over alfalfa, namely, it does not as readily cause bloating of stock. In order to avoid the slight chance of bloating, the animals should not be turned onto the pasture immediately after a rain or while the clover is wet with dew.

Not a Substitute for Alfalfa

Sweet clover must not be considered as a substitute for alfalfa where alfalfa can be grown successfully. Its principal uses are in short rotations where a legume is desired; as a green manure crop; as a legume crop to be planted on alkali soil; or for hay or pasture in localities where alfalfa cannot be successfully grown.

Dry grass on uncultivated lands, ditch banks and roadsides is being burned to prevent an outbreak of grasshoppers in the Patterson district of Stanislaus County.

Calcium or Lime Compounds

By R. E. Henderson

There has been so much of interest in calcium as a soil improver that the California Cultivator is justified in gathering available information as to the different forms of calcium and their effect on the soil. In the issue of June 18 on page 801 Dr. Snowden discussed "Lime and Liming." While he referred to sulphate of calcium or gypsum the article was principally given to the other forms and to their advantages. Herewith is an article also by an agricultural chemist who has a valuable fund of information as to gypsum.

THE continual misuse of the word "lime" makes it necessary to deal with that aspect first. The four common calcium compounds about which this uncertainty of name exists are: Hydrated calcium sulphate, gypsum, lime sulphate, calcium carbonate, limestone, lime carbonate, calcium hydroxide, slacked lime; calcium oxide, quick lime, burnt lime. The term "lime" is frequently indiscriminately applied to any and all of these compounds. A cursory inspection will show that the word "lime" is used in the place of the word "calcium." When the word lime is used alone, therefore, it must naturally leave a doubt in the mind as to just which lime compound is meant. If the word lime must be used alone, let us standardize the word and give to it the same meaning as the chemist gives, namely, calcium oxide. By standardizing the name and giving to other calcium compounds their full name, we will avoid confusion and perhaps save a great deal of loss through a confusion of directions.

Calcium oxide is a very powerful base and owing to its corrosive action is very rarely used for agricultural purposes. It combines very readily with moisture and when combining gives out heat. When it comes into contact with humus, it burns or chars it. When it comes into contact with nitrogenous compounds in the soil it liberates nitrogen as ammonia, which evaporates and is lost.

Calcium hydroxide, or slaked lime, is obtained by adding water to calcium oxide. The two combine and at the same time give off heat. Just sufficient water must be added to complete the reaction and at the same time leave the slaked lime dry. Calcium hydroxide is a powerful base and is very successful in neutralizing acid or sour soils and making them slightly alkaline. It also has a caustic action and liberates ammonia and is not the most desirable form in which to add calcium, though in the case of a very acid soil or where quick action is desired it may be very satisfactory in the hands of a skilled user. It has a slight action on some of the insoluble compounds in the soil which contain potash and phosphates, liberating these and making them available to the plant.

A little experiment will readily demonstrate how ammonia is lost in the presence of burnt lime and slaked lime. Take a teaspoon of sulphate of ammonia and dissolve it in a dessertspoon of water, add a teaspoon of either burnt lime or slaked lime and then smell immediately above the liquid. The smell of ammonia amply proves the loss of nitrogen as ammonia that is continually going on in the soil when either of these two compounds are added to it.

Calcium carbonate, or limestone, occurs naturally either as rock deposits or as shell deposits. When calcium carbonate is heated, carbon dioxide is driven off and calcium oxide is left, which combines with water to form calcium hydroxide. On exposure to air or being air slaked, calcium hydroxide absorbs carbon dioxide and becomes calcium carbonate. However, air slaked lime is not wholly calcium carbonate, but is rather a mixture of calcium carbonate and calcium hydroxide. Limestone is very insoluble in water but is readily acted upon by acid. When it is applied to an acid soil a reaction readily takes place with the consequence that the soil is made neutral and flocculated. Owing to the insolubility of calcium carbonate it is the least positively active of all calcium compounds and for a reaction to take place the other compounds must display a positive activity in connection with calcium carbonate.

If the soil is compact because it is acid, calcium carbonate is successful in opening it up. If the soil is just naturally heavy calcium carbonate is only moderately successful. As calcium carbonate is insoluble in water it does not have any appreciable effect on the insoluble compounds in the soil. Though from the technical viewpoint it is presumed to liberate plant food from the soil, its action is so small as to be unworthy of practical consideration.

Gypsum, or hydrated calcium sulphate, is altogether distinct from the other forms of calcium. It is formed by a combination of calcium oxide and sulphuric acid and is absolutely neutral. Gypsum is not so soluble as calcium oxide or calcium hydroxide, but is more soluble than calcium carbonate. Gypsum is formed from a stronger acid than calcium carbonate and in addition is more soluble. It thus has a very decided chemical action on various compounds. The fact that it liberates potash and phosphoric acid to the plant and that it opens up heavy soil and compacts light soil are too well known to require further discussion. The two properties which are largely responsible for the widespread interest now taken in gypsum are the supply of sulphur and the stimulative action of gypsum on bacteria.

The importance of sulphur as a fertilizing ingredient has long been underestimated. Experiments and demonstrations conducted in all parts of the country have now proved that sulphur plays as important a part in the growth of the plant as does any other element. Gypsum contains sulphur in the form most available to the plant, i. e., sulphate sulphur. In addition gypsum has a very stimulating effect on the bacteria in the soil. It is accepted by most agricultural authorities that plants take sulphur in the form of SO_3 or sulphur trioxide.

Let us then follow the following reactions and note that not only does gypsum preserve its own individuality but at some stage of its career assumes the form of each of the other calcium compounds.

Hydrated calcium sulphate (gypsum) minus sulphur trioxide equals calcium oxide (quicklime) plus water.

Calcium oxide (quicklime) plus water from the soil equals calcium hydroxide (slaked lime).

Calcium hydroxide (slaked lime) plus carbon dioxide from the air equals calcium carbonate (limestone) plus waterwater.

When the sulphur trioxide is taken by the plant from the gypsum, calcium oxide is left which goes through the changes above described until it finally becomes calcium carbonate.

Of the four, then, gypsum appears to have the biggest and most important variety of uses of any of the calcium compounds, in addition to having its own distinct chemical composition and effects. The other forms of lime cannot, however, change to gypsum in the soil.

Campers were responsible for the largest number of man caused fires in the forests of California during the summer months of 1920, according to tabulations compiled by the U. S. forest service and the California state board of forestry. Lightning was the only agency that was charged with being responsible for a large number. Lightning is held responsible for 653 fires during 1920; campers have 362 fires charged against them. There were 260 fires reported to have started from unknown causes and 198 from miscellaneous causes; brush burning was responsible for 124 fires getting beyond control; 117 fires started from railroads, 104 were of incendiary origin and 21 started from lumbering operations, making a total of 1,839 fires in California during the 1920 summer season.

The above fires burned over 415,275 acres of land and did damage estimated at $983,562.

FISK TIRES

Tire Mileage
at the
Lowest Cost in History

NON-SKID
30 x 3½
$15.00

Grey Tubes $2.55

Prices reduced on all styles and sizes

It is so easy to be safe in buying your tires — you need only say "Fisk" and be sure of getting extra mileage, extra comfort, freedom from ordinary tire troubles, and at the same time save substantially on every tire you buy.

Arsenate of Lead on Melons

I have put air slaked lime and arsenate of lead on my muskmelons. I did not measure the quantities but it drove away the little striped bugs. Does it matter if you use too much of one and not enough of the other?—Subscriber, Yolo County.

In this form we do not think there is any danger in making application of too great strength, in fact, in applying the dry arsenate it is often used without any lime or other substance to dilute it. This is especially true in the case of fighting the corn ear worm. It is placed in loose meshed muslin bags and given a light shake over the leaves or plants to be protected. However, one should use care in making this application so as not to waste. To overcome this some gardeners dilute the arsenate with the lime half and half, sometimes using even greater proportion of the lime.

Threshing Small Quantity of Seed

I sowed 100 pounds of Mariout barley for a trial and would like to use it for seed next year. Of course it won't pay to get a thresher for so little, so I was thinking of spreading the cut grain with a manure spreader, then rolling it with a subsurface packer and harrow. Would that be as good as a volunteer crop? Is there a better way?—Subscriber, Palmdale.

If this were thoroughly disked in it might prove fairly effective, but we believe it would be rather wasteful and proper distribution of seed would hardly be secured. If it is done, however, it should be near the end of a thoroughly drying day so as to secure shattering or threshing out of the seed. But why not borrow the method of our forefathers and separate this unthreshed grain on the floor of the barn, turn in the horses or the calves or a few head of sheep and drive them around and thoroughly tread out all the grain from the straw? Then a good windy afternoon may be selected when the straw can be forked off and the chaff and grain tossed into the air and winnowed. The grain may then be sown in the regular way and with more satisfactory return. If the quantity is very small, make a flail of a pitchfork handle or some long stout stick, say five feet long, to which is attached with rawhide thongs another stick about half the length. This is the old time flail. It is better, of course, in winnowing to use a fanning mill if one is available.

Squash Bug

I am sending you a specimen of some kind of bug I have found on my watermelon vines. What is it and how can I get rid of it? The vines will soon have ripe fruit but the runners keep dying off one at a time. The sap has oozed out of runners as if a pin had pricked them. I found a few of these bugs and blame it on them. I tried dusting vines with sulphur and arsenate of lead. I also sprayed with Black Leaf 40, but with no results.—Subscriber. Norwalk.

The bug accompanying this inquiry is a big, healthy specimen of the ordinary squash bug. In a garden, if one begins early enough in the infestation, hand picking and destruction of the pests will control fairly ecnomically. However, where eggs have been deposited and a full brood is on the way this is not very satisfactory. Spraying, likewise, is not practical. In hand picking place boards loosely over soil and the pest will hide and may be readily gathered in large numbers in early morning. Repellents such as gypsum saturated with kerosene or turpentine are sometimes satisfactory. Keeping down weeds and giving clean culture is also beneficial. It is more than probable that your vines may be affected with blight and this blight may be carried from vine to vine by the bugs. As a preventive not only reduce the bugs but the moment the vines show the wilting leaves cut and burn.

Gum Disease

Can you tell me what to do for gum disease on apricot trees? The trees are five years old and the trouble has just started.—Subscriber, Van Nuys.

Like all other trees the apricot is subject to many vicissitudes because of different conditions of irrigation and climate and attacks of insects, all combining to make a sick tree. In the citrus tree the sickness is manifested in chlorosis, yellow leaf or dieback or some other form of "disease"; in the peach tree it may become a case of sour sap, little leaf or "gum disease"; in an apricot tree it is fairly sure to manifest itself in exuding sap which evaporates and soon becomes a rounded mass of gum. The only thing to do is to study the particular tree or trees affected, determine the cause of the trouble and, if possible, remove it.

Canadian Thistle

I have an acre or two of Canadian thistle on my place and wish you could tell me how to get rid of it before it spreads any more.—Subscriber, Oregon.

We are very sorry we can not give encouragement as to an easy method of handling Canadian thistle. Like many of our pests about the only show for complete control is a sharp hoe or a sharp weed cutter, but the pest is so persistent that it is well to bring it absolutely under control while there are only a few acres of it for it will ultimately take the whole farm if not cared for. It is a perennial, but if cut regularly, never allowing the green to show above the surface or at least only for a short time, its vitality is soon exhausted and it ceases to be. There is no chemical control within reasonable cost. It is a very deep rooter and may not be controlled by cultivation or plowing excepting with great frequency. Bear in mind that you must be religiously regular and let the operation be frequent enough so that the plant never has breathing leaves.

Farm Wages

Would appreciate any information you can give me as to the general wage being paid a ranch hand where house is furnished. What is generally paid for packing apricots and peaches? We pack in lug boxes and have no idea

KIRKMAN NURSERIES

Reliable Trees and Vines

For Commercial Orchard and Vineyard Planting

Deliveries made direct from nearest propagating plant. To serve the orchard and vineyard planters of California to the fullest satisfaction and efficiency is our aim. We are gratified to have entrusted to us the future of small orchards as well as the large projects. One acre of Kirkman Trees will draw to us greater future plantings. One California orchard has taken two hundred and fifty thousand of our trees. Another four hundred thousand trees. Another six hundred thousand trees and vines together. They have reservations with us for their next season's plantings. The Ex-Governor of Coahuila, Mexico, named his immense project "El Fresno" in honor of our deliveries of nursery stock. We plan to serve every customer so satisfactorily that his future profits will be assured. Correspondence solicited.

Kirkman Nurseries
Fresno, California

Member of Nurserymen's Bud Selection Association of California

what the rate per box or day is.—Subscriber, El Cajon.

The wage of permanent farm hand where home is provided varies so greatly that it is impossible to give help in answer to a question of this kind. One farmer will be able to get fairly competent help for, say, $75 or $80, while another finds it necessary to give at least $100 per month. The character of the home furnished has something to do in fixing the wage of such hands. Of course where the workingman is offered a fairly modern home with garden and sometimes lights and water included it is a valuable consideration and affects the quantity of cash. Common day labor in canneries and orchard is now commanding 35 to 40 cents per hour. The welfare commission has fixed women's wages in canneries and dry yards the same as last year, that is with a minimum of $15 per week.

Some Potato Marketing Problems

By H. H. Warner

WITH approximately half of the new potato crop in Southern California already shipped, growers are confronted with what appears to be a hopeless market situation. The season opened with farmers receiving around $1.00 per hundred, and instead of advancing the price has declined steadily to about 75 to 85 cents, with many cars rolling unsold and distributors reporting practically no demand. It now seems certain that some fields with a light yield will be plowed under as the price will not pay for the cost of harvesting.

A careful analysis of the situation develops a number of factors which contribute in a greater or less degree to the demoralized market. First of all is the large acreage planted to early potatoes in all parts of the country as a result of the high prices prevailing last year. Government statistics show that while the 1921 acreage of early potatoes is about 31,000 acres less than last season, it exceeds the 1919 area by about 25,000 acres, being estimated this year at over 137,000 acres.

Shipments of new potatoes prior to June 1 have been unusually heavy this year from Florida, Texas and the southeastern states. The U. S. bureau of markets figures show over 7,000 cars this season as compared with over 4,000 in 1920 and about 3,000 in 1919. These shipments found their way farther west than usual this year and many markets which California usually supplies exclusively had already received new stock when our cars began to arrive the latter part of June.

This fact emphasizes the freight rate situation which is certainly one of the big factors contributing to the present distress of the potato farmer. Aside from the heavy burden of an actual increase in freight and refrigeration charges which adds approximately 33 1/3 per cent to the cost of transportation last year, the unsound principle of applying a blanket increase to existing tariffs resulted in shifting the normal distribution of this crop from competing sections to the disadvantage of California producers. There is no doubt but that the farmer growing new potatoes in Southern California is suffering along with producers of other vegetable crops from the increased freight rates, for he and not the consumer pays this increase. It may be true, as the interstate commerce commission contends, that the consumer pays the increased freight on shoes, clothing and articles of that nature which are non-perishable, for the retailer adds this to his selling price and the purchaser eventually pays it. But this principle falls down in handling perishables which must be moved with dispatch to the consumer and on which the actual increase in cost per unit is so much greater because of its weight.

The general decreased purchasing power of the consuming public this year is apparent on all lines and the days of care free and extravagant buying are very definitely past in Eastern markets. Discriminating housewives will buy old potatoes if available at a low price instead of higher priced new potatoes where last year just the reverse was usually the case. This factor, like the increased freight rate, applies equally to other commodities but is a contributing factor to the present discouraging situation on potatoes.

It must be admitted too by any careful observer that the average quality of the new potatoes in Southern California is not equal to the standard of past seasons for the reason that the growing season has not been favorable in every respect. Late frosts resulted in very materially reducing the yield on the lower locations in the interior valleys, and some fields are actually turning out only 20 or 25 sacks to the acre. Late rains also had the effect of causing considerable second growth in some districts, making the potatoes knobby and ill shaped.

The chief cause of the ordinary quality this season, however, was in most instances delay in digging while hoping against hope for better prices. On heavier soils where the ridges cracked open tuber moth caused more or less damage, and on the lighter and sandy soils some patches are showing considerable heat necrosis, a condition which rapidly develops into black-heart if the potatoes are left in the ground too long.

Infestation of tuber moth can be controlled to some extent by ridging up higher to fill the open cracks in the soil, and in some cases a wide roller can be run over the field, breaking down the crust to fill these soil cracks, but of course at the same time breaking off the vines.

Owing to the strict enforcement of the Oregon and Washington quarantine against the entry of California potatoes showing infestation of tuber moth, these markets have received only a few cars this season. Authorities do not all agree that the tuber moth will become a serious pest in these states owing to the colder climate, but at any rate the attitude of the horticultural officials has prevented the shipment of many cars to those markets. This has limited still more the movement of our potatoes and has tended to increase eastbound shipment correspondingly.

The one bright spot in the season's potato deal is the attitude of a large part of the progressive growers on grading. Realizing that now if ever only the very best quality should be shipped, these growers are putting out only U. S. Grade No. 1 potatoes. Shippers who are building up a reputation for quality are encouraging the movement and as an additional precaution are requesting the state shipping point inspection service to certify that these cars do meet the grade requirement. They report that buyers are not only well pleased with the grade but are in most cases willing to pay a premium of from 15 to 25 cents per hundred. As the trade learns that they can buy this grade of potatoes in Southern California, they are insisting upon it and the present indications are that next season the grading will be more generally adopted.

F. o. b. sales are hard to make as the receivers are buying potatoes like other commodities from hand to mouth. They know there are many cars rolling and in the larger cities unsold cars are usually on track awaiting their own inspection and being offered freely. These cars which meet the U. S. Grade No. 1 are preferred in every case, while the ungraded stock goes begging.

There is every reason why the potato grower in Southern California should use United States grades just as the onion grower did this year in the Coachcella Valley, for in time he will materially better the reputation of his product in the receiving markets. It is true that on the basis of the present prices there are a few fields where the cost of sorting out defective stock would be prohibitive, but in the great majority of cases little if any sorting is required to make the grade.

The Final Result of Years of Study of California Tractor Requirements

The diversified farming of California requires special tools and special equipment to perform many of the duties of successful cultivation in orchard, garden and vineyard work.

Realizing this fact and recognizing the demand for a farm power unit capable of performing the lighter tasks of cultivation and the need for an economical tractor we have made a careful study of California conditions, and after years of experimental work with several models, the 1921 VICTOR TRACTOR is the final result and after extensive field tests we are ready to offer the 1921 VICTOR to farmers with full confidence in their successful application to California conditions. The 1921 VICTOR TRACTOR is built with the idea of delivering maximum power required for light cultivating, furrowing out for irrigating, discing, harrowing and all belt work requiring small stationary engine—operating cream separators, grinders, spraying machines, etc. It is easy to handle, turns short and will give entire satisfaction in orchards or rowed crops.

Mechanical Construction

The 1921 VICTOR TRACTOR has a one cylinder, four cycle motor, four horsepower, bore 3¾ inches by four inch stroke.

The drive wheels are 28 inches high and the tractor is 18 inches wide, with independent control of either wheel for short turning.

Straight line construction, direct drive through transmission to bull and pinion gears, all moving parts enclosed.

Worm gear drive in transmission, roller bearings throughout. Clearance 15 inches.

Piston, valves, valve stems and springs, connecting rods, engine bearings and roller bearings are all Ford parts and can be replaced at any garage.

The 1921 VICTOR TRACTOR is Priced to be the Most Economical Farm Power Unit of Its Size on the Market Today

LONELINESS

I sit upon my lonely hill
  Above the little town
Just at the farther edge of day
  When one white star looks down.

The huddled houses murmur soft,
  The drifting shadows meet,
And little lights show red and warm
  A-down the drowsy street.

The slow stars gather while I watch;
  The houses, one by one,
Put out their lights and go to sleep—
  At last the day is done!

I sit, of all the town, awake—
  So quiet that it seems
The hill, the starry night, and I
  Are fragments of their dreams.

But oh, I am not quite content
  To watch here all alone—
To be of others' dreams a part
  And never have my own!
—Abigail Cresson, in New York Times.

THE BRIDE

Slip the dress over my head,
  Don't ruffle my hair!
And, mother dear, hurry!
  I could not bear
He should wait
  For me there,
Or should worry
  And think I'd be late.

How softly the lace falls—
  Such beautiful lace!
Can you see where to fasten the veil.
  Let it cover my face,
For my cheeks are so pale—
The long hours have been trying.
And where are my flowers
  And my gloves?
Do you know
  While you're tying
That bow, time is flying?
  Your hands tremble so!
Why, mother, you're crying!
  Why mother; . . . Oh, mother!

ELSIE

By Margaret Condon

(Concluded.)

"I think night and day are alike wonderful here in your foothills," Janet said softly. "I could love your California, Donald. Some day, perhaps, we shall come, my husband and I, to live here and be neighbors of yours. You enjoy ranching?"

"Enjoy it?" he echoed. "I'm a true son of the soil, Janet. My father destined me for a business career but it's the out-of-doors for me. You could not realize the pleasure I have taken in this ranch."

"I think you are right to follow your inclinations," Janet returned, "and I shall carry back to Elsie's friends wonderful stories of your life in California. I think, Elsie, your girl friends will envy you when I make my report, and they—what is that?" she asked quickly, as far above them on the dark mountainside a bright glow appeared.

"A forest fire!" Donald exclaimed, springing to his feet. "Jove, that's unfortunate. Vegetation on the slopes is so dry now that fire is serious."

"Is there danger, Donald, to our ranch?" Elsie asked anxiously.

"No, no, Elsie; don't be alarmed," Donald said reassuringly. We are in no danger unless a strong wind should come up, blowing from the mountains, and I don't look for that tonight. Even then several firebreaks intervene and we need not fear unless the fire gets entirely beyond control, but there is scarcely any wind tonight."

In fascinated silence for a few moments they watched. Brighter and brighter the red glow appeared. There crept along the dark mountainside a menacing line of fire. It stopped, seemed to waver, with occasional vivid flashes, then settled down into a steady glow.

Donald, who had been pacing the veranda restlessly, came and stood beside Elsie. Under cover of the darkness her hand stole into his, and he could feel that she was trembling

"They are fighting for us, Donald," she said in a low tense voice. "For us—up there in the smoke and heat. To protect our home. The thought frightens me."

"And I ought to be with them, Elsie," Donald returned earnestly. "Every available man is needed when a forest fire breaks out. Will you and Janet be afraid if I leave you alone? I shall take Pedro with me in the car."

Elsie's heart stood still and for a moment she could not speak. All her world seemed to have focused around Donald and their home. Nothing else mattered and he was going into danger.

Donald stood awaiting Elsie's reply. But it was Janet's clear voice that broke the silence.

"Calm yourselves, my children," she said cheerily. "Look, the glare is lessening. See, Donald, the fire is under control."

"Then you need not leave us, Donald," Elsie cried, clasping her hands about his arm. "Oh, how thankful I am that you don't have to go!"

It was true. As quickly as the flames appeared they were dying out. The red glow in the sky was fading. A fitful flare shot up here and there along the line of fire, but it was soon apparent that the fight was won.

The watchers sat tense and silent, but happy, as, gradually growing fainter and fainter, the brightness faded and again the mountainside was its dark, brooding, normal self.

Donald drew a deep breath of relief.

"That was good work," he said. "For a time it looked ominous but all danger is over now. They will watch carefully throught the night so cheer up, Elsie. You and Janet can sleep without fear."

The tension relieved, Janet laughed softly and said

"See how Elsie loves Oakglen, Donald, though she is quiet about it. I'll wager she was thinking of those wonderful live oaks and sycamores on the hillside. Well, I don't blame her. But now I shall have to say good night and go to that pretty room above the roses that Elsie told me was mine. My long journey begins tomorrow and I shall carry away with me pleasant memories of you two in your sunny foothill home."

Donald sat alone in the cosy room after Janet and Elsie had left him. He had tried to read but his mind refused to concentrate. Beating against his consciousness was the thought and hope, "If only—if only Janet's viewpoint would influence Elsie."

He heard a light footstep descending the stairs, and Elsie stood in the doorway, looking very childlike in her blue negligee and slippers, her long sunny hair falling in a heavy braid over her shoulders.

Donald noticed that her eyes were shining, her cheeks crimson, an adorable Elsie, who slipped over and nestled down beside him as he said:

"I thought you were in bed, Elsie."

She shook her head and said softly: "I've been thinking, Donald, and I came to tell you. I can see how selfish I've been, but that's all over and done with."

A happy light broke over Donald's face as he closed his arms about her.

"You mean, Elsie, that you've exercised a woman's privilege and changed your mind?" he asked.

"Don't you understand, Donald? Janet has opened my eyes. I see things clearly now—as they are. Isn't she wonderful, Donald? Clear in her judgment, true blue and sincere. If I were only like her."

"I like you very well as you are, Elsie," Donald returned, his eyes shining with happiness. "But blessed be Janet. Then we may keep the ranch? Oh, glory be! Elsie, you can't realize what this means to me."

"I think I can, Donald," the girl said very gently, between laughter and tears. "I understand now, and my homesickness has gone forever; it burned to ashes with that fire on the mountain tonight. How glad I am that I awakened before it was too late. I have not forgiven myself yet, but kiss me, Donald, and say you forgive me. I'm very happy, and I'm going to love our wonderful California."

WINGED AEROPLANES

The speed at which a duck can fly is much greater than the average person would suppose. For instance, it has been estimated by a competent authority that the speed of the canvasback duck is 98 miles per hour; that of the blue winged teal duck, 89 miles; and that of the Canada goose, 76 miles. These speeds are probably in excess of their average flights, however.—Our Dumb Animals.

The Cultivator Patterns

3655. Ladies' Dress—Cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size will require 5⅛ yards of 40 inch material. The width of the skirt at the foot is about 2¾ yards. Price 10 cents.

3675. Child's Play Suit—Cut in four sizes: 2, 3, 4 and 5 years. A 4 year size will require 1⅞ yard for the bloomers, and 1¼ yard for the waist, of 27 inch material. Price 10 cents.

3277. A Popular House Dress. Cut in seven sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. A 38 inch size requires 6¼ yards of 36 inch material. Price 10 cents.

3681. Girl's Under Garment—Cut in six sizes 4, 6, 8, 10, 12 and 14 years. A 10 year size will require 2⅛ yards of 36 inch material. Price 10 cents.

3657. Misses' Dress—Cut in three sizes: 16, 18 and 20 years. An 18 year size will require 4⅝ yards of 38 inch material. The width of the skirt at the foot is 2 yards. Price 10 cents.

3653. Child's Dress—Cut in four sizes 2, 4, 6 and 8 years. A 4 year size requires 2¾ yards of 27 inch material. Price 10 cents.

3658. A Practical Seamless Apron—Cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size will require 2¾ yards of 36 inch material. Price 10 cents.

3661. Girl's Dress—Cut in four sizes: 6, 8, 10 and 12 years. A 10 year size requires 2¾ yards of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

HINTS FROM HOUSEKEEPERS

Uses for Sour Cream

A friend who visited me recently was very much shocked to see me add a half cup of sour cream to a kettle of boiled new potatoes which had just been drained and dried over a slow fire. She tasted very gingerly, then with enthusiasm passed her plate for more and wanted to know just how to do it. I was as much surprised to find that she and others thought the only possible use of small left overs of sour cream was in soda breads, and thought I would send this suggestion to the Cultivator. If the cream is not very sour I merely add salt, a little black pepper, perhaps a scrap of butter to any vegetable, cabbage, cauliflower, turnips, carrots, potatoes, and set on stove to cook up thoroughly. If it tastes sour after cooking I add a tiny pinch of soda. The sour cream gives a delicious flavor, suggestive of cheese. Indeed, I often add a bit of grated cheese to any creamed vegetable or fish.

An aunt I used to visit made the most wonderful sour cream sauce to serve over apple dumplings. I think she just stirred it with spoon, adding sugar and spices. Can anyone tell me about such a dressing? I have experimented but don't get it just right.—Subscriber, Carpinteria.

Pumpernickel

When we make white bread we take one-half of dough and knead equal amounts of rye meal and corn meal into it. Form into loaves, let rise and bake. This bread is healthy and easily made.—Mrs. Henry Pfeffer, Los Gatos.

Rolled Oat Honey Cookies

2 cups rolled oats, 2 cups sifted white flour, 1 cup honey, 1 cup chopped raisins, ½ cup chopped walnuts, ½ cup Mazola, 3 well beaten eggs, 1 level teaspoon soda (scant), 1 level teaspoon salt, 1 level teaspoon cinnamon. Mix well and drop from teaspoon on buttered pans and bake in a moderate oven.

Custard pie, pumpkin pie and sweet potato pie are fine sweetened with honey, one-half cup to each pie.—Mrs. Henry Pfeffer, Los Gatos.

Three Helpful Hints

As every housewife knows, brown sugar has a habit of becoming exceedingly hard and lumpy. Lumps so hard sometimes can hardly be rolled or smashed up. When such occurs just put it in a pan and set it for a short time in a warm oven. Just as soon as it gets a little warm it will be in a condition to crumble up perfectly, just as easy as can be.

Another help I came across is this: It is quite difficult to measure a half cup of solid butter, as it has to be pressed down even into a cup. But try this way: Fill the cup exactly half full of water, then put butter in until cup becomes full of the water. Keep butter under the water and when water rises to top of cup pour it off and you have your half cup of butter.

Another little convenience is this: I have practiced it for years and find it handy in many ways. I keep a small meal sack, one long enough to be tied in a knot, instead of using separate string, and I put soap, any size, in it, and when I want soapy water for any reason, to boil clothes, for instance, I put the sack of soap in the water. No soap sticks to clothes; none is wasted; what is left in the sack is there for next time and small pieces can be used. When taking the sack from the water I put it in an old pan and it is ready to add more to at any time. —Mrs. M. H. Brown, Sherman.

FRESH MEAT EXCHANGE

Eldorado County's fresh meat exchange is decidedly popular. The Farmers Exchange Abattoir and Packing Plant at Diamond Springs has begun deliveries on a new route, making tri-weekly deliveries of fresh and cured meats on the Placerville-Phillips Station route on the Lake Tahoe highway. A retail meat department has also been opened at Placerville. Carl H. Schroeder is manager of the plant.

OUR READER CONTRIBUTORS

My Salary

Suggested by "My Rosary," published on this page last week, a member of the Cultivator staff contributes to this department a treasured parody which will make universal appeal.

My Salary!

The hours you spend with me, dear "Men,"
Are very few, it seems to me;
I count you, every dime apart,
My Salary! My Salary! !

Ten cents a dime, ten dimes a "plunk,"
To earn them is an awful grind;
I count each dime unto the end, and there—
A "dun" I find.

Oh, toil, that is so poorly paid!
Oh, salary, spent before we greet!
I kiss each dime, and try to find a way
To make ends meet—
Ye Gods! ! To make ends meet!
—Anne Alfreda Mellish.

The Text of the Flowers

The verses following were composed by a 16 year old high school girl:

The Text of the Flowers

Jack-in-the-pulpit stood alone
Erect in his velvety-cushioned throne.
He spoke to the flowers far and near
And this is what I happened to hear:
Brethren, sisters I want to say
"Help one another" is my text today.

We've just been charmed by sounds of the dell
And the beautiful tunes from the Heather Bell:
The Trumpet Vine echoed a series of notes
And the birds of the forest have quite split their throats,
And now I hope you'll listen, too,
To the little sermon I've prepared for you.

Way down in the city, I heard today,
Children are living without music or play.
Our lives are brief in this world of care;
Why can't we go and bring happiness there?
And we'll each earn a star high up in our crown
'Gainst that fateful day we're all cut down.

The hearts of the flowers were sorrowfully stirred
By this message of cheer they'd recently heard,
And they prayed that they might be borne away
To the home of the little ones who never play.
The prayer was heard. The message was caught,
Borne on by the wings of a wonderful thought.

The flowers were plucked and sent away
To scores of children who cannot play;
By each little cot with its lonely child
Lay a beautiful bunch of blossoms wild.
The glimmering dew on each little flower
Twinkled in smiles from its leafy bower.

And the little lame girl, now rid of her frown,
Cried: "God's put a star in each little crown."
—Elaine Barkway, Merced, age 16 years.

California Cultivator

The verses below give my feeling for the California Cultivator.—Fred Barnes, Escalon.

California Cultivator

C is contentment you will show with a smile,
A is after you read this paper awhile.
L is legal questions, answered always true,
I is interesting from cover to cover thro.
F is friends who read it day and night,
O is others it will find, if it keeps on going right.
R is reading easy on the eyes,
N is the news we get from over the state.
I is industries; therein advertised,
A is anxious we get if we have to wait.

C is the conscience the editors s e e m to have,
U is usefulness we find on every page.
L is lively and a paper wide awake,
T is happy times, after the p o s t m a n leaves it at the gate.
I is investment, a dollar very well spent,
V is vim it gives a person, who is tired and weary
A is advertisements about w h i c h you need not be leary.
T is that to the world, we'd like to say,
O nly that the California Cultivator is the best
R anch and rural paper out today.

COMMUNITY COLD STORAGE ROOMS

The Butte County farm bureau passed a resolution favoring the building of cold storage rooms with individual rent boxes for community use in various parts of the county, believing such cold storage facilities to be especially valuable for the use of farmers when they wish to kill a beef or porker and put the meat in a cold storage compartment for use as they need it. Plans for such a plant are well under way.

Sycamore Acres

By Jack Klein

WHEN Robert N. Clapp, a young business man of Chicago, heard the call of the open and felt the magnetic pull of the Golden State, he burned his bridges behind him and came West with an ambition to found a herd of Holsteins that would be a credit to the state and of which he might be justly proud.

Although a city man, his love of livestock had brought him the friendship of many of the big Holstein breeders of the Middle West, and around the rings of the National Dairy Shows in company with these men he had learned much about his favorite breed, so that when he bought the E. R. Stalder ranch at Nuevo in Riverside County 18 months ago and started out to find his herd he had a good idea of what he wanted.

Two of his early purchases were Stanislaus Piebe Laura Pontiac, who made 32.82 pounds of butter from 512.7 pounds of milk in seven days for him, and Moneta Segis Pontiac, a three year old who made 29.91 pounds of butter in seven days.

At the Stalder sale last October Mr. Clapp was the heaviest buyer. His most notable purchase was the great cow, Gerben Abbekerk Maid, who has three times made over 34 pounds of butter in seven days and in ten years has dropped 11 sound calves which have been sold for $11,500. She is being run on strictly official test for the year and promises to make a great record, having recently given 116 pounds of milk in a day, 60 days after freshening.

At the same time he bought Rosamaines Pontiac Goldrop, who has freshened as a senior two year old and made 24.31 pounds of butter from 591.3 pounds of milk in seven days and 96.38 pounds of butter from 2,386.6 pounds of milk in 30 days. In the recently published list of awards for the year covering the entire country she stood twentieth for seven days butter fat, tenth for 30 days butter fat, third in seven days milk and second in 30 days milk, winning a total of $56 in prizes for her owner.

Another good one from the Stalder sale is Rosamaines Korndyke Beauty, who freshened as a senior yearling and made 22.24 pounds of butter from 574.6 pounds of milk in seven days and 88 pounds of butter from 2,311.3 pounds of milk in 30 days. These records make her both state and national champion for her age.

Since the first of the year Mr. Clapp has imported two carloads of Holsteins from the Middle West. These animals were all chosen with the greatest attention to type and individuality and are excellent producers, although but few of them have official records. Remembering the lessons of

Sycamore Acres Holsteins

Upper left: Evelina Calamo Korndyke, 26 pounds in 7 days at 3½ years. Upper right: King Segis Pontiac. Lower left: King Segis Pontiac Aero, herd sire Sycamore Acres herd.

the ringside he has chosen largely of the blood of King Segis Pontiac, who has sired many show winners and big producers, including K. S. P. Lily McKinley, the world's champion three year old with 37.62 pounds of butter in seven days, who also is now in California in the herd of D. G. Mawell at Hollywood. King Segis Pontiac is a great sire and the sales of his sons aggregate over $250,000. His most famous sons are K. S. P. Alcartra, known to Californians as the sire of King Segis Alcartra Prilly, the grand champion bull of the Bridgford Co.; K. S. P. Chicago, K. S. P. Konigen, K. S. P. Count and K. S. P. Jannek, who was recently sold by J. J. Jefferies to the Santa Monica Dairy Co. for $4,200.

At the head of the herd at Sycamore Acres, the name given by Mr. Clapp to his farm, is the two year old King Segis Pontiac Aero, who is a perfect picture of his sire and who is out of Evelina Calamo Korndyke, a well known daughter of Paul Calamo Korndyke, the greatest show bull of the breed, whose picture appears in the heading on the first page of the Holstein Friesian World. This cow has a record of 26 pounds of butter in seven days as a three year old and 28.2 pounds of butter in seven days and 113 pounds in 30 days as an aged cow. In looking at this young bull there is no question that type breeds on and that he shows the finest qualities of both sire and dam.

In the herd are 22 daughters of King Segis Pontiac and a number of daughters of his 37 pound son, Pearl King Segis Pontiac, and of K. S. P. Chicago.

Among the outstanding cows is Segis Walker Gelsche, a daughter of the King of the Black and Whites and a double granddaughter of King Colanthe Clothilde, son of Colanthe Johanna Lad. She is known the country over as "the white show cow" for she has never failed to stand second to Minerva Beets, who was five times grand champion at the National Dairy Show.

Another good one is K. S. P. Lucy Wayne, who is out of Lucy De Kol Wayne, the only cow who ever defeated Minerva Beets and who turned the trick at the Iowa Dairy Congress in 1914.

Perhaps the most widely known cow of the herd is Nancy Calamo Korndyke who is out of the great show cow, Nancy Spofford, the dam of the 40 pound Nancy Lucy Hengerveld, recently brought to this state in the Maxwell herd. Nancy Calamo Korndyke has a long record as a successful show animal, having stood first in her class four years at the National and the big Eastern shows.

Never shown and entirely unknown there is in the herd a cow, Evergreen Beauty 2nd, who, if she shapes up right, will be a strong contender in the shows this fall. In a herd of fine individuals she is outstanding.

There are at Sycamore Acres about 50 cows in milk and the youngsters who make up the balance of the herd of 125 head are mostly out of these cows, as Mr. Clapp has combined two eastern herds with his California purchases.

Livestock News Notes

After dropping twin calves during the recent hot spell in June, Canary Segis Prilly, the oldest daughter of King Segis Alcartra Prilly, the famous three times grand champion bull owned by Bridgford Holstein Co., Patterson, made an official record of 26.57 pounds butter from 637.6 pounds milk in seven days at the age of three years seven months. Her best day's milk was 105.4 pounds, and her record indicates that in older form the daughters of her sire are going to keep up the tremendous milk production shown in their two year old records.

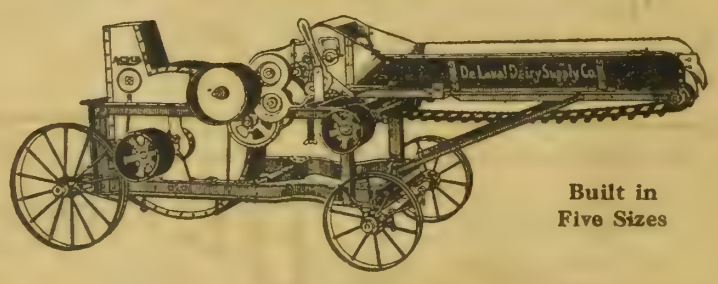
Two excellent long time records have recently been completed in the small herd of outstanding registered Holsteins owned by Dean Beeman, Woodland. Johanna Hengerveld Capunna, freshening at four years 11 months, made 783.36 pounds butter from 18,676 pounds milk in 305 days on three times milking and running with the herd. She is the dam of Pearl Na Dean De Kol, the great heifer that Mr. Beeman sold in the Guaranty Sale last March for $1,125 to The Sunshine Company, San Fernando, and regarded as one of the great bargains of the sale. Jean Na Dean De Kol, freshening at two years three months, has completed a 365 day record of 852.48 pounds butter from 21,578.2 pounds milk, record made on three milkings per day, and never fed over ten pounds of grain per day. She is by the same sire and out of a 33 pound full sister to the $1,125 heifer mentioned above. This great heifer made over 50 pounds of butterfat in the fourteenth month of her first lactation period, milking around 45 pounds per day.

Norena of Ashwood, a Jersey cow owned by McArthur and Stauff of Oregon, has recently produced 113.36 pounds of butter fat in 30 days, which is said to be a new record for that breed.

E. F. Peterson, general manager of the Diablo Stock Farm, Danville, has secured from prominent Eastern herds a carload of yearling and two year old Polled Hereford bulls and two carloads of heifers. It is understood that one carload of two year old heifers will be delivered to the Hammond Lumber Company of Humboldt County.

Representatives of Wm. R. Hearst continue making selections of Herefords for the herd that Mr. Hearst is

"Filled 16 Silos---Still ACME as good as new"



Built in Five Sizes

Mr. P. N. Ebsen of Astoria, Oregon, bought an Acme Cutter in June, 1917. It has filled 16 silos. Mr. Ebsen writes that he is not in the market for a cutter now, as his old Acme is still good as new. Isn't that the kind of a feed cutter you want?

Every Acme Cutter is a Combined Silo Filler, Hay Chopper and Alfalfa Meal Machine — a year 'round feed saver.

establishing in this state. Five young cows, four of which are by Disturbers King, were recently purchased in Indiana.

One thousand head of choice cattle have been purchased in Arizona by Frank O'Connell of the firm of O'Connell Brothers and will be placed on their 21,000 acre ranch, situated east of Coyote and extending south to Pine Ridge in Santa Clara County.

H. C. Muddux and son Forrest of Sacramento, prominent Shorthorn and Berkshire breeders, have returned from a three months' trip to England, Scotland and the continent.

King Pontiac Netherland Segis 3d, the splendid son of Gerben Abbekerk Maid, now has a 30 pound daughter, Dorothy Pontiac, who recently made her record of 30.04 pounds butter from 527 pounds milk in seven days at four years two months. This heifer has shown consistent increase in her records at each freshening, having made 18.25 pounds butter from 365.1 pounds milk as a junior two year old, 22.84 pounds butter from 472.6 pounds milk as a junior three year old, and now with the 30 pound record noted above as a junior four year old. Rosamaines Novena Netherland, a junior two year old daughter of Rosamaines Pontiac Netherland, the bull now owned by Pottenger Sanatorium Co., Monrovia, made 22.51 pounds butter and 481 pounds milk in seven days. Juliana Canary Mercedes, at three years one month, made 27.59 pounds butter from 640 pounds milk in seven days. She is sired by Prince Juliana Walker, who is over 90 per cent the same blood as the great heifer Miss Valley Mead De Kol Walker, whose sons have commanded record prices in California. All three of the heifers noted above are owned by Peter B. Kyne and O. H. Cash, at their Sierra Vista Stock Ranch, Perris.

F. F. Peabody, owner of the Eaglê Ranch in Santa Barbara County, has purchased from Dr. J. L. Higgins of Tennessee two Aberdeen-Angus heifers that are daughters of the celebrated 1919 chamion, Idolmere, and bred to Perinthian, the 1920 champion. The Peabody herd is coming to be one of the leading collections of the Angus breed owned in the West and doubtless will be seen at some of the forthcoming shows.

C. C. Slater, Martinez, has at the head of his herd of registered Holsteins a bull of higher record backing than is usually found in the average herd. This bull, Model Francis Glista, is sired by Model King Segis Koningen, a 31 pound proven grandson of King Segis, and is out of Glista Finella, a 32.37 pounds daughter of the famous three times 34 pound cow and seven times 30 pound cow, Glista Ernestine, whose best record is above 35 pounds and she has twice milked over 800 pounds in seven days in the Cornell University herd. The seven nearest dams of Mr. Slater's bull average 30.22 pounds butter in seven days.

Up at Willits in Mendocino County is a herd of registered Holsteins that is the extreme western outpost of the breed in America, and it is composed of animals whose quality well represents the breed in pioneer territory. This herd is owned by H. H. Sisson, Sunnybrook Ranch, who has figured as a buyer in some of the best California sales. One of the choice young matrons of the herd is Princess Boweda Alcartra, that made 21.02 pounds butter from 538.5 pounds milk in seven days, freshening at two years four months. She is out of a daughter of the famous 37 pound cow Boweda. Another of the good ones is Piebe Colantha Estata Pride, that made 18.39 pounds butter from 468.6 pounds milk in seven days at two years three months. She is out of a granddaughter of Colantha Johanna Lad. An outstanding cow in the herd is Cantate Domino Sir Skylark 3d, a 27.30 pound daughter of Dutchland Governor Sir Colantha that milked 606.1 pounds in seven days. She is half sister to the bull that sold in the Brentwood National Sale for $27,500 this spring. Heading the herd at Sunnybrook is the splendidly bred bull Ensign Korndyke Model Pontiac that topped the bulls in the 1920 Guaranty Sale at Sacramento. He is sired by Chimacum Spring Farm King Pontiac, whose daughters are making sensational yearly records as heifers, and is out of a daughter of Paul Aaggie Oakhurst, whose daughters also are making wonderful records, among them the world's record senior three year old for both milk and butter, Lady Aaggie Echo Hengerveld.

When 100 descendants of the great cow Gerben Abbekerk Maid sold at public auction for over $50,000 in the Rosamaines Rancho dispersal at Riverside last October the event furnished one of the most spectacular demonstrations in Holstein history of the dollars and cents value of one outstanding cow. Among the hundreds who witnessed the sale there were perhaps only a few who knew the herd well enough to appreciate that the prices so widely considered spectacular were actually very modest when measured with the real worth of the cattle, and as the descendants of this great cow became scattered through many herds as a result of the sale we are now just beginning to see what they are capable of doing in other herds. Some of the latest substantial production records made by descendants of Gerben Abbekerk Maid have been made in the choice herd owned by E. R. Stalder, Wineville. Eva Pontiac Netherland, a senior three year old daughter of King Pontiac Netherland Segis 3d, son of Gerben Abbekerk Maid, recently completed official records of 29.83 pounds butter from 613.1 pounds milk in seven days, and 123.96 pounds butter from 2,556.8 pounds milk in 30 days. Parthenia Netherland Pontiac, another daughter of the same bull, made 27.64 pounds butter from 530.5 pounds milk in seven days as a junior four year old. Rosamaines Ormsby Abbekerk, a daughter of the grand cow Gerben Abbekerk Maid, and sired by Rosamaines Pontiac Netherland, a son of King Pontiac Netherland Segis 3d, made one of the most remarkable records to date. Freshening at the age of one year and ten months she made 20.63 pounds butter from 505.1 pounds milk in seven days, and 84 pounds butter from 2,036.1 pounds milk in 30 days. The first five daughters of her sire to freshen at an average age of 24 months have averaged slightly over 20 pounds butter in seven days.

Give a Thought to Livestock

By R. P. Royce

CAREFUL observers are rather unanimous in their opinions that one of the weakest points in California farming operations centers around the small part livestock occupies on the average ranch, and the idea is generally and frankly expressed that until our ranchers come to a more active appreciation of the importance of some sort of livestock, they will continue to fail in getting the most from their investments.

Despite the fact that this state enjoys unusual blessings of soil and climate, there is no sound reason for assuming that our agriculture can be built on anything approaching a permanent basis by ignoring the fundamental fact that the fertility of the soil can only be maintained by making proper return to the soil of the necessary plant food.

There is little question but that lack of livestock noted on the small ranches of this state can be largely attributed to the marked tendency for our agricultural practices to develop along specialized lines. Specialization in field and orchard practice is a factor of profound importance in California. It at once appears to be the hope and stumbling block of our development. By the very nature of our soil and climate, certain sections appear to be adapted to certain fruits or crops, and it would be unwise to argue otherwise. Because of the special adaptation, it has followed that our marketing machinery has been constructed to take care of the situation, and this in turn has encouraged and stimulated further specialization of agricultural practice.

Our small ranchers are concentrating their investments in oranges, lemons, prunes, grapes, pears, apricots, peaches or some other product of tree or vine, or they may be alfalfa, bean, wheat or barley growers. And, generally, it can be said that a very, very small percentage of groves, orchards or vineyards maintain any livestock.

Now it is not the intention of the writer to advocate any revolutionary reorganization of our agricultural industry, but I do want to suggest a few thoughts that can be taken for what they are worth.

The old admonition as to the unwise practice of putting all of one's eggs into a single basket has been proved mighty sound. With due appreciation of the tremendous importance and volume of the fruit industry of California, it would seem a mistake for our growers to forget that fruit is raised in other states. If exploitation of that industry is carried on more rapidly than the demand develops, one or two situations, or both, might develop. Our growers might come to a sudden realization that Florida produces oranges, Georgia and Texas, peaches, the Northwest and the Mountain states produce a fine quality of apples, and local orchards in the Mississippi Valley and the Eastern states continue yielding a pretty fair quality of fruit. Again, the hazard of depending entirely on one or two specialized crops increases with the degree of specialization. And, finally, the matter of soil fertility will become of pressing importance.

The writer quite well appreciates the fact that there are many small fruit places where livestock would not fit in to advantage, but he is positive that there are thousands of small places where a few cows, a brood sow or two, along with chickens, would prove profitable adjuncts and I am convinced that if the owners of such places would consider their future welfare rather than, perhaps, their present convenience, their books at the end of the year would show a healthy increase.

Why do not more of our small ranchers raise livestock? The most common reply to that question is that the owners do not care to be "bothered." Now, of course, if one happens to be so situated that he can regard his ranch operations incident to a pleasant time, why that is one thing, but if he is using and expects to use his ranch to make for himself a comfortable living, it would seem that a cow or two to furnish milk and butter and a few hogs to furnish fresh and cured meat, along with a poultry flock, would be good business, especially where there is more or less feed produced that goes to waste.

The first week in July a severe wind visited the Sacramento Valley and in its wake the ground was covered with fruit, mostly pears. It was stated that the loss in that district would amount to 200,000 or 300,000 boxes of pears and plums—and presumably not 20 per cent of the fallen fruit will be utilized by hogs. The incident referred to is a small item, but the point is that these ranchers should have had hogs to turn in their orchards.

During the past two weeks thousands of acres of standing and harvested grain have gone up in smoke. Nothing new, of course; we have become used to seasonal fires and rather expect them. A few insure, but the form of insurance is not the kind that California needs. California ranchers need the insurance furnished by livestock.

If more of our grain farmers maintained a small herd of cattle, either beef cattle or dairy cattle, and a few hogs, less of their land would be in grain and more in green pasture (if they adopted a sound plan).

Under such a system properly handled the benefits would be many.

Less grain would be available to speculators in hammering the price on the total crop, and prices would tend toward greater stabilization. Vast quantities of splendid feed in the form of stubble or grass could be made into beef and milk. In the event of a crop loss or failure the rancher's income would not be totally wiped out, and he could fall back to a degree upon his livestock to help pay his current expenses.

CORRECT GRADING OF WOOLEN GOODS

The purpose of the French-Capper bill is to force correct branding of woolen goods. At the present time no distinction is made between goods made from new wool and those made with a greater or less amount of reworked material known as "shoddy." When you go to a clothing store the salesman offers you a suit which he guarantees as "all wool." It may be all wool, but the purchaser does not know how often some of the wool has been re-worked. Manufacturers admit that cloth containing shoddy will not wear or keep its shape like cloth from virgin wool. If manufacturers were compelled to brand each piece of goods so as to show the percentage of reworked wool, the customer would soon put a premium on new wool goods.

The opponents of the bill make these claims. First, that correct branding is impossible to enforce, because there is no way of determining by chemical examination whether goods contain shoddy or not; that if there were no shoddy used there would not be enough woolen clothing for everyone, as the world only produces about 14 ounces of woolen cloth per year for each man, woman and child in the temperate zone; third, that shoddy does not interfere with the sheep man's profit because wool sells for more than shoddy; that if enough wool was produced shoddy would be driven from the market and that consequently the sheep business is not affected by shoddy.

"This line of reasoning is not satisfactory," says C. I. Bray of the Colorado agricultural college. "It would be just as easy to station U. S. inspectors in wool mills to put their stamp on goods as it is to maintain the present meat inspection service in packing plants, but such close inspection might not be needed."

The shoddy industry is a legitimate one. People may have clothes made from that material if they so desire and cannot afford real wool. If goods were branded with the proportion of

re-worked wool contained, the wool producer would not be wronged. But where a cheap and inferior substitute sells along with higher priced and purer material, with no distinction made between the two, there is only one result possible—the cheap material sells for more than it should and the good material for less. This has been proven in the case of eggs. Where eggs are sold "case count" with good eggs, rotten eggs and partly hatched eggs all on the same basis, the price paid for the good eggs is always lowered. When bought on a "candled" basis, the good eggs bring their full value and the bad ones are thrown out. Increased wool production can only lower the price of both wool and shoddy under present conditions. If shoddy is forced to sell as such the public will then pay a sufficient premium on genuine woolen goods to give the wool grower a profit. The labor cost of making a suit is no greater with good material than with shoddy material.

CHANGES AND LOSSES OF ENSILED CORN

Every farmer who has a silo knows that some change takes place in the substance of the corn or other crop conserved by this means, and it is generally assumed that some loss in substance of both moist and dry matter takes place as a result of fermentation and leeching. To ascertain as definitely as possible the amount of this loss, its causes, and means for wholly or partially preventing it, the dairy division of the United States department of agriculture has been conducting a series of experiments. The results of two years tests are covered in a professional paper, Department Bulletin 953, "Nitrogen and Other Losses During the Ensiling of Corn."

Samples of silage in cheesecloth sacks were buried at various depths and positions in a silo 42 feet high by 14 feet in diameter, holding approximately 150 tons. The bags were weighed when put in, and samples of the silage analyzed. When the bags were reached in feeding out the silo the contents were again weighed and analyzed.

The two years work furnishes evidence of a downwash of the juice in the silo, carrying with it soluble food materials, so that the silage in the lower part of the silo may gain in food material at the expense of the upper part. There was an average loss for all the bags of nearly ten per cent of the dry matter, which apparently is due largely to the fermentation of the carbohydrates and to the carrying away of soluble material by the juice. The sugars almost entirely disappeared. There was a considerable loss of crude fiber and of the furfurol yielding bodies. There was a loss in total nitrogen, which was larger when the corn put into the silo was immature than when mature corn was used. It is probable that this loss is due largely, if not entirely, to the nitrogenous compounds in the juice. The albuminoid nitrogen suffered a loss of over 50 per cent, while the non-albuminoid forms increased several times their original weight.

There was a gain in ether extract, probably due to the formation of new ether soluble bodies. The second season nearly 10,000 pounds of juice escaped from the silo. This juice carried a considerable percentage of nitrogen of various forms which in ordinary practice would remain in the silo.

The results are as yet incomplete and the tests are being continued.

BE GENTLE TO LIVESTOCK

"A merciful man is merciful to his beast." Aside from sentimental considerations it pays to be gentle with livestock.

The old time range practice was to "treat 'em rough." A calf was roped on the run, thrown end over end, and dragged to the branding place. Vaccination, castration and dehorning were all done at one job, and usually in a crude, unsanitary and cruel way.

The practical value of treating livestock with consideration for their comfort is now appreciated by the best breeders and ranchmen, according to Geo. H. Glover of the Colorado agricultural college. One livestock owner makes this statement: "Keep all livestock as quiet and make them as gentle as possible and your feeding costs will be noticeably reduced." If animals are to fatten and make the best growth they must be contented.

When animals are sheltered from annoying or exciting occurrences they eat more, digest their food better and it actually takes less food to keep up natural growth and fat production.

THE BREEDER-EXHIBITOR

By Frank D. Tomson

There has come a useful change in recent years in the practices of exhibitors of pure bred livestock and the attitude of the public interested in this branch of livestock husbandry.

In earlier days it mattered little whether the exhibitor bred the animals which he had on exhibition or not. The fact that he possessed them was regarded as sufficient to attach importance to his operations, that is, if his entries were of the winning sorts. Naturally this resulted in a great advantage to the man who had money and could acquire animals of merit from various sources. It was not even essential that he should own any other livestock. The fact that he appeared on the show circuit with a group of show animals was accepted as sufficient evidence of his desire to be identified with the business. He might compete and win over an experienced breeder who relied on his own productions to make up his show display and little thought was given apparently to the more deserving producer.

But this has all changed. The record associations are placing a premium upon the entries exhibited by the breeder and have arranged the classifications so that in some of the contests none may compete but the breeders of the entries. This is along the line of progress. It is a constructive attitude due in part to the foresight of those who direct the affairs and make the appropriations of the records associations, in part to the claim for recognition by the breeders, and in part to the desire of the interested onlookers who study the problem of livestock improvement.

So it has come about that in the leading fairs and shows the breeder has been given a place of preference in the classifications, a preference that is substantial because of the extent of the cash appropriations.

As an example a list of the leading fairs and shows offers prizes in the Shorthorn classes to the amount of $168,000. Ten thousand dollars of this amount goes to Shorthorn steers and $25,000 to the Milking Shorthorn classes. This list does not include a very large number of local, county and district fairs at which liberal Shorthorn prizes are offered. In all of these the breeders' interests are given preference and the breeders' efforts encouraged. The period of his identity with Shorthorn breeding has no relation to his prospects as an exhibitor. These are based entirely upon the character of his entries. The beginner who shows his first animal may carry off the coveted championship if the animal is good enough.

This constructive conception of the situation is encouraging beginners to start with a better class of individuals as a foundation. Another inducement exists. It is the attitude of the buyers in public sales and in private transactions showing preference for animals bred by the seller, provided, of course, they represent the standard sought for.

This is the day of the breeder in the pure bred stock industry and the business is on the most favorable basis as a result.

DEEP BUT SALTY

Oswald—My love for you is like the deep blue see—

Clarissa (for such was her name)—And I take it with the corresponding amount of salt.—From London Opinion.

Life is so full of a number of things that men should be glad for the neck and the wings.—Houston Chronicle.

SIR AAGGIE DE KOL MEAD

His Sire: SIR AAGGIE DE KOL ACME, son of the world's official yearly butter record holder, Aaggie Acme of Riverside 2nd, 1,331.66 lbs. butter in one year, and she the dam of Miss Aaggie Acme Burke, 1,034.66 lbs. butter from 24,338.9 lbs. milk in one year as a junior 2 year old, world's milk record in class in 1920. He has over 100 living daughters, the first sire in California to have that distinction.

His Dam: MISS VALLEY MEAD DE KOL WALKER, 1,113.57 lbs. butter from 22,021.1 lbs. milk in 342 days as a junior 3 year old. She has three sons in active service, one of which, and a half interest in the other two, have commanded the highest prices ever recorded for bulls of any breed in the west.

THE RECORDS BEHIND SIR AAGGIE DE KOL MEAD:

Five of His Seven Nearest Dams Average:		
Butter	2 Years	2,040.97 Pounds
Milk	2 Years	41,547.20 Pounds
Butter	1 Year	1,160.66 Pounds
Milk	1 Year	23,096.60 Pounds
His Seven Nearest Dams Average:		
Butter	7 Days	30.47 Pounds
Milk	7 Days	627.60 Pounds

Keep your eye on this great young sire of the Aaggie Acme-De Kol of Valley Mead breeding. His first calves measure up fully to the promise of his pedigree, and you may need one of his young sons to round out your herd one of these days.

Owned Jointly by

Fred Hartsook and **A. W. Morris & Sons Corp.**
Lankershim, Cal. Woodland, Cal.

Sir Aaggie Hiske Walker

SHOW TYPE and PRODUCTION

He was first in two year class at Riverside last year
His dam is a 34 lb. daughter of Prince Gelsche Walker
His sire is the 30 lb. Morris bull—Sir Aaggie De Kol Acme
A limited number of approved cows will be accepted for service.

E. D. BARRY, JR. Workman and Azusa Ave., Covina, Cal.

King Segis Pontiac Jannek

A proven sire of show winners and high producers is available for service to high class Holstein cows.

SANTA MONICA DAIRY CO.

Farm is on Washington Blvd. 2 miles east of Venice. Santa Monica

For Exchange — 5 acres young cherries and almonds in Yucaipa Valley east of Redlands. Land carries double water right. Value $3500. Want desirable house in town near San Francisco. Address Box 565, Redlands, California.

For Exchange—160 acres big trees, near Roseburg, Oregon and S. P. R. R. 7,000,000 feet, $42.50 per acre. O. P. Smith, 810 Wright & Callender Bldg., Los Angeles.

PATENT ATTORNEYS

WEBSTER, WEBSTER & BLEWETT. Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.

BEEKEEPING VS. FRUIT GROWING

By Henry Perkins

THE honey bee is one of nature's greatest pollenizing agents. Without the bees and kindred nectar gathering insects many varieties of plants would become extinct for lack of fertilization. The bee is specially active as a pollenizer due to the fact that pollen forms an important part of its food supply and is eagerly sought after during the brooding season, which by the way is always when the flowers bloom the most. Greenhouse men and orchardists fully realize the necessity of having a good supply of bees present during blooming season. I have in mind a customer who tells me that were it not for the bees he keeps in his greenhouse he would not get any cucumbers.

Bees have been accused of spreading fruit tree diseases in this way as well as pollen. Tests along this line have demonstrated that they were no more to blame than other insects. Diseases still spread after the bees were banished but the setting of fruit was light. Trees that were inclosed with wire screen were in some cases free from disease, but also without fruit. The value of the bee as a pollenizer makes a good talking point for the apiarist who is endeavoring to induce a fruit grower to lease him a bee location. On the other hand, the bees can make themselves an awful nuisance to fruit and grape growers at harvest time, undoing all the good they may have accomplished earlier in the season. Much controversy has arisen in the endeavor to fix the responsibility for damage done to sweet fruits apparently by the bees. It has been repeatedly demonstrated that bees when confined with ripe grapes or peaches will starve to death unless the skin of the fruit is pierced or broken. The contention is that the fruit must first be damaged by birds or yellow jackets before the bee can make any progress. Be that as it may, the bee certainly finishes the job and gets the blame. Dampness will cause some ripe grapes to soften sufficiently about the stem to give the bees a starting point. At any rate, it is a difficult matter to convince a grape grower that bees can do him no damage when they are swarming about his grapevines, leaving little else but hulls on the clusters.

A great deal of prejudice against bees has grown out of the indifference a few bee men have shown toward the complaints of their fruit growing neighbors. Bees can be moved temporarily while a vineyard cannot. The point I am trying to make is that both industries may be of mutual benefit to each other if fair play is practiced on both sides.

Next time I will talk about honey plants of California.

CANTALOUPE INSPECTION

At a recent meeting of cantaloupe growers in the Turlock district, with F. W. Read in charge of standardization and inspection service, a committee consisting of A. R. Eddy of the Westfall Lane Company, M. C. McCauley of the California Vegetable Union and D. F. Mahaffy of the T. M. & G. was appointed to cooperate with the state department of agriculture and County Horticultural Commissioner Rutherford in inspection and standardization work during the coming season. A special effort will be made to put out nothing but best quality cantaloupes this season, and Eastern buyers desiring inspected goods have only to wire their shipper to that effect and inspection will be furnished by the state department of agriculture.—F. W. R.

A SUGGESTION

If any little flower of ours can make
one life the brighter,
If any little flower of ours can make
one heart the lighter,
God help us pluck that little flower and
take one bit of singing,
And drop it with some lonely soul and
set the echoes ringing.

—Clipped.

Californians Buying Herefords

During the past few months two well known Californians, William R. Hearst and Charles S. Howard of San Francisco, have been attracting attention through their purchases of registered Herefords that each are assembling for herds to be maintained in this state. The American Hereford Journal in reviewing the activities of these two promnient recruits to the Hereford ranks has the following to say:

"Attention of Hereford breeders has recently been directed to California by liberal purchases of high class foundation stock for two new breeding herds in that state. Representatives of William Randolph Hearst have attended a number of sales recently and made purchases of select breeding stock. They have also visited many of the leading herds and made purchases at private treaty. It is reported that they are negotiating for the purchase of one or more leading herds and of one or more of the best known bulls in the country.

"Another Californian is establishing a herd of choice registered Herefords on a 15,000 acre ranch in Northern California. He is C. S. Howard, president of the Howard Auto Company San Francisco. For some time past F. B. Stonerod of San Francisco has been talking Herefords to Mr Howard. About three weeks ago, while on a business trip to the East, Mr. Howard wired Mr. Stonerod to meet him at Cheyenne. Together they visited a number of herds in Wyoming and Colorado in search of a choice lot of animals for foundation material and for a show herd which Mr. Howard proposes to send over the western circuit this year. From John E. Painter & Sons, Roggen, Colorado, he secured 48 two year old heifers, some with calves by side and the remainder to calve next fall. In the lot were 21 daughters of Beau Perfection 6th, a half brother to Woodford; four daughters of Donald Rex, ten daughters of King Rupert and several by the imported Mansell Boy. The dams of these heifers are descendants of cows bred by Gudgell & Simpson. In addition to the heifers above mentioned Mr. Stonerod secured from the Painter herd the junior champion heifers at the 1921 Denver show and a senior yearling heifer.

"From the Hereford Corporation of Wyoming Mr. Stonerod selected a senior heifer calf of Fairfax breeding that was the futurity champion at the 1921 Denver show, and a two year old daughter of Rialto, the sire of the $6,000 Miss Rialto, purchased by Sen. J. N. Camden, Versailles, Kentucky. The Rialto heifer is in calf to the service of Bonnie Lad Jr., sire of many of the Hereford Corporation's prize winners. Two sons of Bonnie Lad Jr. also were taken.

"Other purchases were made from J. M. Carey & Bro. and the Lowell Purebred Cattle Company. Prince Imperial 2d 864009, bred and owned by Dr. T. F. De Witt, Denver, was chosen as herd bull. He is a three year old son of the noted Prince Imperial by Domino, used a number of years by Dr. De Witt and later sold to Mousel Bros., Nebraska. Prince Imperial 2d is a grandson of Mischievous 3d 343220, dam of Mischievous Jr., the De Witt bull that was grand champion at Denver last winter. His dam was by Beau Dandy. Another selection made by Mr. Stonerod from the De Witt herd was a junior yearling son of Mischievous Jr. which Dr. De Witt was preparing for this year's shows. His dam was Lady Fairfax 9th 294557 by Perfection Fairfax, and was formerly a prominent member of Governor McCray's show herd.

"The Howard herd will be in charge of William Cooper, a well known herdsman and fitter, who was for four years in charge of the Painter herd. As soon as the cattle reach their California home Mr. Cooper will begin the work of selecting and fitting a show herd for the coming season.

"Mr. Howard's ranch is located on the Pacific highway, 200 miles north of San Francisco. It is known as the Ridgewood Ranch, and is situated in Mendocino County. It is one of the show places of California in the famous redwood section. Mountains, giant trees, abundance of living water from streams fed by eternal snows, combine to make it an ideal location for a herd of registered Herefords, and an ideal place for a busy business man to retire for a week end vacation. Mr. Howard is an enthusiast over anything he undertakes, and he is taking hold of the Hereford breeding business with the same whole hearted energy that has made him a success in other lines of endeavor."

How the Hog Business Looks to Stingle

George Stingle, who maintains a small herd of Berkshires on his ranch near El Monte, has made a success of raising hogs and he is one man who refused to be stampeded when hog prices headed toward a lower level last fall. Stingle does not spend all his time raising Berkshires. Part of his time is spent thinking, and because he thinks straight and sound his conclusions and ideas are always interesting. In reply to inquiry as to the future of hogs in California, put to him by the Berkshire World, Stingle offers the following:

"At the present time there is on foot a movement of national scope to encourage the public to eat more meat. A part of the purpose is to combat the campaign being waged by milk and vegetable advocates to educate the public in the superior food value of these products. This may be necessary for the benefit of the livestock growers and again it is quite possible that it is not necessary at all.

"Aside from a limited number of people who adhere to the vegetable diet as a matter of hygienic principle the general public has not been buying vegetable fats and oils and meat substitutes because they had a superior food value but because they were cheaper.

"The housewife long ago got quite disgusted telephoning the local butcher to send over a dollar's worth of pork chops and if she wasn't home to put it through the keyhole. The grower of the pork chops was equally disgruntled when he found that the pound of pork for which he received 16 cents had cost him 18 cents to produce and that same pound in turn was costing the consumer about 42 cents.

"What was the result? The housewife quit buying it and the grower quit growing it. Now the future is beginning to shape itself.

"Due to general economic conditions the pork production costs have been cut down until there is an inviting profit in hog growing. Now what we need and what we will have is not a campaign of education (or vegetation) but a series of meat products shops maintained by the growers where the housewife can buy a dollar's worth of good meat for a dollar. This is not an experiment. It is being done in several parts of the United States right now and the practice is spreading rapidly. It is also being done successfully in several places here in Southern California and the demand for good fresh meat directly from the farmer at these small plants is so great that the prevalent idea of people in a warm country not being given to much meat eating is proving to be a fallacy. The successful operation of these plants shows that the consumer is cooperating strenuously with the producer to bridge the chasm between the two and nothing will do more to uphold the hog growing industry than this spirit of combativeness on the part of the consumer toward the prevailing exorbitant retail prices.

"Another thing we need and will have is more hogs in California, more good hogs. California does not begin to produce as much pork as she consumes. With a constantly increasing consumption of pork and with the greatest field in the world for the most economical development of good hogs, year in and year out, there is little reason to doubt the future. It will be a matter of only a short time until, with the cooperation between producer and consumer, breeder and grower, the hog industry in California will be so stabilized that all parties concerned will get a square deal."

A MILLION MORE HORSES—AND WHY

That the horseless age is receding into uncertainty is shown by the U. S. census figures, which give a grand total of 27,676,939 horses and mules on January 1, 1920, an increase of nearly a million in the last decade. Of the total 20,667,319 horses and mules were of working age, coming four years and over. Approximately 17,000,000 were in harness doing farm work, and 2,000,000 in round numbers actually at work in cities, towns and villages. These 19,000,000 horses and mules in service require 9,500,000 sets of harness.

The investigations of the Horse Association of America show that the average harness lasts 12 years. Wagons last 15 years. Both harness and wagons can be patched up to last a year or two longer, if necessary, but the figures given are a fair average for ordinary conditions. This means that approximately 800,000 sets of harness are needed every year to take the place of that worn out and discarded. Exports of harness and saddlery reached their high point in 1915 when $18,237,604 worth of equipment left the country. The amount fell off in subsequent years but increased again in 1919 and 1920, when the figure rose to $2,273,234, three times as much as in 1913.

The average working period of horses on farms is 12 years; in cities it is eight. With harness giving service for 12 years and wagons 15 years the rate of depreciation of horse drawn equipment is very low.

TO RID HOGS OF WORMS

Worms are responsible for many unthrifty herds of hogs and often aid serious swine diseases to gain a foothold, says G. Bohstedt of the animal husbandry department of the Wisconsin college of agriculture.

"To keep away worms feed the pigs well," he urges, "especially young pigs. Do not throw the feed in the mud. Keep the lots and pens clean and free from old rubbish or filthy wallows.

"A formula used successfully in the Wisconsin experiment station herd as a worm expeller includes: Santonin, 2½ grains; calomel, 2½ grains; areca nut, 1 dram; sodium bicarbonate, ½ dram.

"This dose is for a 50 pound pig and may be used in proportionate amounts for a larger or smaller pig. The santonin and calomel are the two most important parts of the formula and should be used if either of the last two be not handy.

"Withhold feed 18 hours previous to treating pigs. Give the medicine in a thin slop, if pigs are accustomed to slop, otherwise by the drench method. See that each pig gets its share. Repeat after a week or ten days.

"A good method is to have your druggist make up ten times a formula for a package so as to enable one to treat lots of ten pigs each."

Diamond Bar Duroc-Jersey Show Herd For Sale

As we will not exhibit at the fairs this fall, we offer for sale the entire show herd which we are now fitting as we consider it will be better business, both for us and the breed, to have these animals win in our customers hands.

They are without doubt the best hogs Diamond Bar ever fitted and should win at any show in the country.

Our prices are very reasonable, as we want these animals to be in the show rings this fall.

Herd consists of Aged Sows, two Senior Yearling Sows, ten Junior Yearling Sows, ten Under Year Sows, three Under Year Boars and three futurity litters.

Act at once if you want one or more of these great individuals to win for you this fall.

DIAMOND BAR RANCH

The blood that carries highest production combined with greatest individuality.

MAXWELL FARMS, Hollywood, Cal.

For Sale, bulls of all ages from high record dams—reasonably priced.
Also some fine, big-producing females.
All animals guaranteed breeders and free from tuberculosis.
Farm in San Fernando Valley

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Age of Consent

What are the minimum ages at which minors are capable of contracting marriage in California? Is the law the same in all states—Subscriber, Orland.

Any unmarried male of the age of 18 years or upwards and any unmarried female of 15 years or upwards, and not otherwise disqualified, is capable of consenting to and consummating marriage. A subsequent provision with respect to the issuance of licenses provides that in case either party is a minor and has not been previously married no license may be issued except with the consent in writing of the parents or one of such parents, duly verified, but it has been held when licenses are issued without such consent the marriage is not, nevertheless, invalid. These rules vary among the different states, both as to age of consent and as to the provisions with respect to the issuance of licenses.

Olographic Will

Is a will written, dated and signed in the handwriting of the testator, whereby all property was given to his wife but wherein he failed to name any executor, a valid will? Is it necessary that it be probated?—Subscriber, Visalia.

Such will as to all property within this state is entirely valid. The party seeking the probate of such will or seeking appointment as administratrix of the will would have to execute a bond in double the value of the personal property and actual rents of real property.

Raising Rent

In the case of a lease of property with option to renew for a further term of years can a lessor raise the rental for the additional time?—Subscriber, Eureka.

That depends entirely upon the exact terms of the option. In some instances it is permissible; in some instances the renewal will be upon the exact terms of the original lease.

Alien Poll Tax

Is an alien, who has taken first naturalization papers and will take the second on the first of December, required to register and pay the poll tax under the recent constitutional amendmend and law requiring registration of aliens and poll tax of ten dollars? When must the tax be paid? I have resided in California for 30 years and pay taxes on property.—Subscriber, Galt.

The act provides that every alien male inhabitant of the state over 21 and under 60 years of age must register and pay this poll tax. For the year 1921 it is provided that the tax becomes due and payable on August 1 and delinquent on December 31, after which there is an added penalty of 50 per cent. It undoubtedly requires aliens to register even though they have made application for naturalization, and as the tax is due on August 1 it would very probably be true that even though the alien was admitted to citizenship in December he would be required to pay the tax. It is considered highly probable that under treaty provisions many citizens of foreign countries are exempt from the operation of this tax, but that is a matter which remains to be decided by the courts and probably will be decided before long.

Indian Depredation Act

Some time since a number of actions were filed against the United States for depredations committed by the Rogue River Indians of Oregon. The court of claims decided that as the Indians were at war with the United States no claims for the damages would be allowed. The case was subsequently appealed to the supreme court. What was the result?—Subscriber, Cahuila.

In 1891 an act of congress provided that where depredations were committed by a tribe in amity with the United States an action could be maintained against the Indian tribe and the United States in the court of claims. Upon the facts of the case being proven the damages would be awarded payable either out of the Indian funds of that tribe or out of the United States treasury. The Rogue River Indians, however, arose as a tribe. In the treaty after their conquest, out of the moneys awarded to them $15,000 were retained to pay the claims arising from the depredations. It was held that as the tribe as a whole was not in amity with the government claims for depredations were bounded by the provisions of the treaty and the $15,000 proportioned to the claimants who refused other reimbursement. The purpose of this Indian depredation act was to make the tribe of Indians responsible for any depredations committed by individuals of the tribe but not to cover cases wherein the tribe itself arose.

Poultry Queries

(Conducted by Jean A. Koethen)

Droopy Chicks

When my chicks are from a month to six weeks old they begin to droop, sit around without much appetite and finally die. They have no lice or mites, have range, fresh water, growing mash, sometimes moistened with sour milk, sometimes dry, and milo maize for hard grain. I have read all the Cultivator says about feed, but still my chicks die.—Old Subscriber.

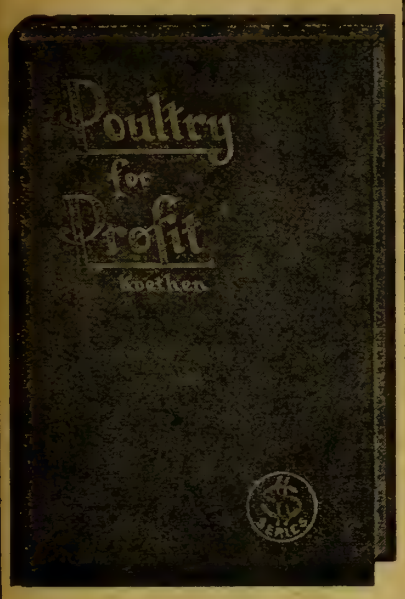
Your ration could be improved by the use of several grains instead of one. Cracked corn is particularly good for chicks. You might make the scratch feed equal parts cracked corn, wheat, milo and sprouted oats or barley, or feed the dry grains at night and the sprouted grain at noon. This, however, is merely incidental. It is not the feed that is killing your chicks. They ought to do well enough on what they have, with range and plenty of greens. It may be they are not getting enough green. You do not mention that item. When chicks the age of yours droop and sit around it is almost always because they either have coccidiosis or are having the life sucked out of them at night by mites. Diarrhea, sometimes bloody, is a symptom that is usually present in coccidiosis. If you have painted their house with an insecticide and know positively there are no mites in it, you might as well assume that the trouble is coccidiosis and treat accordingly. Feed lightly of grain and mash, giving grain night and morning and keeping the mash before the chicks only two hours a day. Keep sour milk before them all the time. With their other feed diminished they will be obliged to drink the milk, and this kills the bacteria in their intestines. Put them on fresh soil if possible. If they are on infected ground, that explains the disease. If you cannot move them, spade their yards and disinfect the house thoroughly.

Eye Trouble

Some of my hens go blind in one eye or in both. The eyes swell and they cannot see to eat. They are all on range.—Old Subscriber.

As your hens are on range it is quite likely they have foxtails or some other bit of weed in the passage between the eye and nostril, or possibly under the eyelid. Every affected eye should be carefully examined. If there is no foreign substance in sight the end of a feather dipped in boric acid solution, then inserted gently at the inner corner of the eye and twisted before it is withdrawn may draw it out of the nasal passage. After the irritating substance is removed, or if nothing is found, cleanse the eye by dropping a few drops of boric acid solution into it night and morning.

Poultry Can Be Made Profitable



Making use of information gathered from experienced poultry writers who have been guided by their practical experiences will always result in profit from poultry.

How Much Feed?

How much chick feed shall I give to 50 incubator chicks, and at what age shall I change to larger grain?—Mrs. A. M., Covina.

The best practice is to place the chick feed before the chicks on a tray for the first few days, letting them eat as they will till they have learned to eat. After the first four or five days it is scattered in clean alfalfa litter, and the chicks have to dig it out for themselves. Enough should be given so that there is always something for them if they will work for it. You can begin mixing a little whole wheat or Gyp corn or cracked corn in the chick feed almost from the first. When you see the chicks are eating it put in more of the large grain and less chick feed. Some chicks will pick out the larger grain in preference to the smaller after they are two weeks old, and the sooner you can work them onto all large grain the better for them.

Leghorn Pullets

Can you tell me where I can buy some young White Leghorn pullets?—Subscriber, Zelzah.

The best way is to watch the ads in the Cultivator and other papers. Possibly this query will put you in touch with some breeder who has them.

Sunstruck Gosling

During the extreme heat of June 21 one of my six weeks old goslings keeled over and has not been able to walk since, though it seems all right otherwise. Do you think this was sunstroke, and can you suggest anything to do for the bird?—Subscriber, Petaluma.

It may not have been exactly sunstroke. I doubt if the gosling would have lived in that case. It was overcome by the heat and may not recover the use of its legs. The only thing to do is to keep it in a shady place and feed all the greens it will eat. If it does not improve, eat it as soon as it is large enough. Both ducks and geese are quite susceptible to heat.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, June 27, 1921. Report for week ending June 26:

In the thirty-fourth week of the egg laging contest the White Leghorns made a clean sweep by outlaying all other breeds. This is the first time in the tenth contest that the Leghorns have been able to capture all honors for the week. A pen of White Leghorns owned by Andrew L. Ohr, from Wallingford, Connecticut, was first for the week with a production of 58 eggs, or a yield of a little over 82 per cent..

The hens in the egg laying contest laid 3,867 eggs, or a yield of 55.2 per cent for the week. This is a drop of 263 eggs less than last week, 9 eggs less than last year for the same period and 154 eggs less than the six year average.

The four leading pens in each of the principal varieties are as follows:

Plymouth Rocks

W. H. B. Kent (Barred), 1,391 eggs; Rock Rose Farm (Barred), 1,208; Jules F. Francais (Barred), 1,126; James F. Macdonald (White), 1,087.

Rhode Island Reds

Charles H. Lane, 1,436 eggs; H. S. Bickford, 1,311; F. S. Chapin, 1,291; Henry P. Walker, 1,286.

White Leghorns

Hollywood Farm, 1,398 eggs; L. F. Ingoldsby, 1,396; James O. Le Fevre, 1,337; Jack Trevethan, 1,335.

Other Varieties

Obed G. Knight (White Wyandottes), 1,518 eggs; H. P. Cloyes (Buff Wyandottes), 1,215; A. E. Hampton (Black Leghorns), 1,081; Harry D. Emmons (White Wyandottes), 990.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

For the ten days ending June 30 the contesting hens laid 3,200 eggs, or a production of 60 per cent. S. L. Gibson of Santa Cruz led the race with a production of 79 per cent for his ten hens. The high pens were as follows:

S. L. Gibson, Santa Cruz, 79 eggs; Geo. Gray, Santa Cruz, 74; Geo. Brenneke, Santa Cruz, 74; D. B. Walls, Petaluma, 74; W. A. Ford, Umatilla, Oregon, 73; Alex Stewart, Santa Cruz, 73; H. Beernink, Lynden, Washington, 73; J. S. Conrado, Santa Cruz, 73; Gibson, 72; Ed Buttler, Oakland, 71; C. E. Hyde, Seabright, 71.

WHALES FOR POULTRY

At Newport, England, experiments were conducted with the idea of testing the feeding value for egg production of whale meal. For the purpose of the experiment four Leghorn pullets and a cockerel were used. They were penned in a small enclosed run with a small scratching shed house attached.

The birds were fed three times per day; at 7 a. m., with a mixture of grain consisting of wheat, oats and maize; at noon they were given their warm mash consisting of whale meal (scalded) 1 part by weight, clover meal (scalded) 1 part, bran (scalded) 1 part, oat meal or sharps 4 parts. The oat meal and sharps were fed on alternate days. The quantity of food given averaged 2 ounces of grain and 2 ounces of dry meal per day per bird. At 4 p. m. the birds were again given a feed of the grain mixture as in the early morning. The grain was fed in scratching litter and the soft mash in troughs. The whale meal was used in the same proportion as fish meal has been used previously and was made to substitute it entirely from the date of commencement of the experiment.

During the 31 days' trial the weights of the birds showed a slight average increase. The four pullets laid 101 eggs, giving an average per bird of 25.25 eggs for the period. The eggs produced were all over 2 ounces in weight and did not develop any tainted flavor from the whale meal. After the first day the birds took to the new food readily and were always eager for their mash afterwards. The rather strong smell of the meal probably put them off for the first day. The results obtained show that whale meal may be used as a substitute for fish or meat meals and that no detrimental effects are produced either upon the birds themselves or the quantity or quality of the eggs produced.

CASTOR BEAN MEAL

A series of experiments in feeding castor bean meal has been carried on at the Harper Adams agricultural colleeg, Newport, England.

Six cockerels were given food consisting of 1 part caster meal and 5 parts mixed meal (sharps, ground oats, etc.) at the rate of 4½ to 5 ounces per bird each day; a little grain food was given in addition, and grit and water were also available. The birds ate the food eagerly but steadily lost weight, and after about ten days they began to look unhealthy. At the end of 36 days one bird died, and four days later another. Forty days later ordinary diet without castor meal was given and the remaining birds slowly recovered. The total loss in weight over the period was 7.25 pounds, or 1.21 pound per bird. Post mortems of the dead birds disclosed the ordinary symptoms of poisoning.

CHEAPER TO STAY AT HOME

It takes a pretty hard-boiled patron to get by the check boys at restaurants, although most persons would rather care for their own coats and hats in places that provide wall hooks and coat trees. But the managements expect the patron to check his belongings and should he be persistent and refuse to give up his clothes for the privilege of buying them back again he frequently finds the service so bad from the waiter that he never goes there again.

That's merely a way of letting the patron know that he is not welcome to come there and eat if he is unwilling to go the whole way and patronize all the grafts in the house.

The uselessness of the coat checking system was illustrated the other night at a downtown restaurant when a man came in and gave the hat boy a quarter for the privilege of keeping his own coat. It was a valuable fur garment and he did not care to take the risk of it being stolen from the check room. So he hung it up on the wall hook where he could keep an eye on it.—New York Sun.

Cantaloupes: Demand and movement moderate, market firm. Standards mostly 2.25@2.50, few 2.75, flats 90@1.10. Jobbing: Standards 2.00@2.25, mostly 2.25, few 2.35, flats 75@85. Arizonas: flats 85@90. Casabas: Supplies increasing, demand moderate, market steady, 2½@3 per lb.

Cherries: Supplies light. Demand good, market steady. Whites, Royal Anns mostly 12@15; Black Republicans 12@20, Bings 18@22, few fancy 25@30 per lb.

Figs: Supplies light, market firm. Northerns: Flats, Black Spanish mostly 1.25. Imperial Valley: San Pedros, flats mostly 1.00. Locals: 20 per lb.

Grapes: Supplies light, market weak. Per lb., Thompson Seedless and Malagas 12@14; poorer 9@10.

Loganberries: Supplies limited, market stronger, 30 pint crates mostly 3.50@3.75.

Peaches: Supplies light, movement moderate, market stronger; wide range in quality and condition. Lugs, various varieties, best 1.50@2.00; poorer 1.00; Early Rose, 1.90@2.00; fy., 2.25@2.50.

Plums: Suplies liberal, movement moderate, market weak. Few varieties mostly 3@5 per lb.

Prunes: 5@5½ per lb.; Satsuma and Climax 5@6½ per lb.

Raspberries: Supplies light, market firm. Cuthberts 2.75@3.25; few 3.50.

Strawberries: Supplies moderate, market firm. Per crate, No. 1's 3.00@3.75; No. 2 stock 2.50@2.75.

Watermelons: Supplies liberal. Demand good, market stronger. Mostly 2½, few 3, poorer 1¾@2 per lb. Jobbing: Klondikes $45@55; other varieties 30@40 per ton.

CITRUS FRUITS

Grapefruit: Suplies liberal, market steady, movement slow. Local: Per box, market pack 2.00@2.50, special packed brands 3.00@4.00; ordinary 1.75.

Lemons: Supplies moderate, demand good, market strong. Local: Packed box mostly 5.00, few fancy 6.00@7.00, loose 3.00@3.50, per box fancy 4.00@4.25, lug boxes 1.25@1.50.

Oranges: Supplies liberal, market steady. Valencias, best brands, all sizes, 3.50@4.00, few 4.50; ordinary 2.50@3.50; loose pack 1.00@1.50.

HONEY

As reported by the Bureau of Markets: Los Angeles: Supplies of White Sage, White Orange and Light Alfalfa, heavy. Light wire inquiry. Movement very slow, market steady, little change in prices. Carloads f. o. b. usual terms at loading points: White Orange new crop 12@12½; old crop 10@11; Light Amber Alfalfa old crop 5@6, new crop 5½@6½; White Sage 12@12½. Hawaiian, no sales reported. Beeswax: Market weak, very light demand. Dealers asking 30@33 for light and 24@26 for dark. Estimate of crop unchanged from last report. Sage and Orange crop very uneven, some places normal, others practically none. Exchange expects stronger market but other brokers expect weak and dull market.

GRAIN AND FEEDS

Grain Exch. price bid July 12:
Corn: Bulk No. 2, Yellow 1.60.
Bran: Kansas, 24.00.
Kafir: Eastern, No. 2, 1.56¼.
Barley: 1.12½.

HAY

Alfalfa Growers of California report prevailing prices f. o. b., Los Angeles:

No. 1 Dairy	19.00
Standard	15.00

Receipts light; no improvement in price or tone. Some dealers and users have commenced to stock up for fall and winter. Prices so low that growers in some sections would get practically nothing for their hay, after paying freight, baling, hauling, etc., if they were to sell in the central markets at present prices.

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	18.00@26.00
Barley	16.00@24.00
Alfalfa, No. 1 Dairy	18.00
Standard	16.00
Straw	10.00@13.00

San Francisco Markets

San Francisco, July 12, 1921.

Quotations made daily by San Francisco Wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by the wholesalers to producers are eight per cent less.

Pinks	6.50
Mexican Reds	8.00
Red Kidney	9.75
Henderson Bush	4.40
Cranberries	6.25
Bayos	11.00
Blackeyes	8.00

HAY AND FEED

Alfalfa Growers of California state that prevailing prices f. o. b. S. F. are:

No. 1 Dairy	16.50
Standard	14.50

Under date of July 1, A. W. Scott Co. says:

Receipts 1,500 tons, 1,318 last week. A quantity of hay has come in upon consignment and the necessity of moving this has made prices extremely weak and at a lower level all around. No selling activity has been reported from country districts where pressing is now going on in every direction with fullest activity. Alfalfa continues dull and heavy with arrivals and offerings far in excess of demand. Clover hay is selling readily at prices asked and is doing considerably better with the dairy trade than alfalfa at the present time. Mill feeds seem to have about reached their low level and advances are likely to take place, owing to the fact that the Northwest is now supplying the heavy Eastern demand and is not directing milling products this way as formerly.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	15.00@18.00
Wheat Hay, fair grade	13.00@15.00

GRAIN

Wheat: Milling, 1.90@2.05; feed, 1.90@2.05.

Barley: Feed, 1.00@1.07½; shipping, 1.20@1.30.

Oats: Red Feed, 1.20@1.30.

Corn: California yellow, 1.55@1.60; white Egyptian, 2.40@2.60 per cental; California red milo, 2.00@2.10; Eastern red milo, 1.95@2.00; Eastern kafir, 1.75@1.80.

Citrus Markets

Los Angeles, July 13, 1921.

Large quantities of home grown melons, small fruits and even deciduous fresh fruits are meeting the demand for general Eastern consumption and oranges are not in keenest demand. This is resulting in an exceptionally quiet condition and prices reported from Eastern markets are not entirely satisfactory.

On the other hand lemons are given warmest reception. The weather reported fom nearly all portions of the East has been exceptionally hot and $9.00 to as high as $14.00 have been reported during the week. These prices have stimulated imports and at the present time there are nearly 11,000 boxes of lemons on piers or will be available for sale within the next 30 days.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 30,499 cars; lemons, 8,372; total, 38,871. To same date last season: Oranges, 24,464; lemons, 6,259; total, 30,723. From Central California to date this season: Oranges, 6,629; lemons, 210; total, 6,839. To same date last season: Oranges, 5,374; lemons, 289; total, 5,663. From From Central California to date this sea- Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

HIS ARGUMENT

Johnny hated his early bed time. In the course of one of the nightly arguments his mother told him how all the little chicks went to sleep with the sun. For a moment he was silent, then he piped up: "But the old hen goes to bed with them, you know, mamma."

The extra half hour was conceded.

LET 'ER DROP!

A speaker was irritated by the noise made by the assemblage. "Silence!" he roared. "I want this hall to be so still you can hear a pin drop." There was a deadly quiet for a moment; then an irrepressible youth piped up: "Let 'er drop."

THE SPANISH BROOM

This ornamental, drouth resistant plant is a prime favorite in all parts of California. It is generally catalogued under its true name of Sparium junceum, though occasionally someone lists it under its garden name of Genista Hispanica. For growth under the hardest conditions it is not surpassed in value by any plant we grow. A recent bulletin published in Italy, says of it:

"In domestic economy, broom is put to various uses, small faggots are made to light fires, large sweeping brooms, temporary roofs for huts, bands for plants fixed to props, bushes for silk worms, etc. In Calabria, when silk worm eggs were produced, the branches, bound together in the form of small screens, served here and there for the female moths to lay their eggs on, a purpose to which they were extremely well adapted.

"For firewood, broom is cut every three years, towards the end of the autumn, and grazing is prohibited for a year after cutting. It is a good honey producing plant, and its seeds could be fed to poultry and pigeons. The part of greatest utility is the bark, from which a textile fibre can be extracted. The latter is prepared, spun and woven as a home industry in many parts of Calabria, especially the province of Cosenza. These fibres are used also to make ropes and paper, which are likewise distinguished for their great lightness."

CINNAMON CUB CAPTURED IN YOSEMITE

A real live Teddy bear has been taken in Yosemite Creek in Yosemite National Park. Evidently it had gotten lost and was found crawling out on a log where it was captured and taken down to the village. The cub is brown in color and is therefore a real cinnamon bear. He is taking well to the nourishment supplied by Chief Ranger Townsley and the ranger and nature guides hope to raise him until he is able to take care of himself. The nature guides photographed the little fellow the other day. He is so small that the background for the photograph was a ranger's hat.

Visitors to the Yosemite are being given the opportunity again this year to hear the nature guides talk on the geology, birds, animals and flowers of the region. One night recently 1,100 people heard the nature guide's talk at Camp Curry on the water ouzel, the bird so beloved of John Muir, which sometimes builds its nest behind a waterfall, thus necessitating the mother bird to dive repeatedly through the fall in carrying food to her young.

DURABILITY OF WOOD NOT AFFECTED BY TIME OF CUTTING

Many of the theories advanced regarding the durability of wood attribute too much importance to the time of cutting, say specialists of the U. S. forest products laboratory. As a matter of fact, the time of cutting has very little effect upon the durability or other properties if the timber is properly cared for after it is cut. The method of handling logs at different times of the year, mowever, does influence their durability.

Timber cut in late fall and winter seasons more slowly and with less checking than during the warmer months, and when proper storage or handling is impracticable, winter cutting is best. Fungi and insects do not attack wood out of doors in cold weather, and by the time warm weather arrives the wood is partly seasoned and somewhat less susceptible to attack. It is for these reasons that winter cutting is advantageous, and not on account of a smaller amount of moisture or sap in the wood in winter, as the popular belief has it. There is practically no difference in moisture content of green wood in winter and summer.

EZEKIEL'S OFFENSE

Now, Ezekiel Smith was a most patient and loving man. Never did he give offense to anyone—let alone his wife.

She was a fine woman—masterly and strong—and her home was her idol.

Ezekiel Smith always opened the door with his handkerchiefs, lest his fingers should leave their mark on the brilliant brass doorknob.

"Zekey," she said one evening, as he sank quietly into a chair, "I can read you like a book. You've been doing something wrong! Did you scrape your boots before entering the hall?"

"Yes, my dear!"

"Then what have you done?"

Ezekiel blushed to the roots of his hair and clasped his shaking knees.

"Martha," he stammered, "I hung my hat up carelessly, and a raindrop fell from it onto the umbrella stand!" —London Answers.

WE DON'T WANT ALFALFA WEEVIL

The recent appearance of the alfalfa weevil in several thousand acres in the vicinity of Reno, Nevada, makes it imperative that everyone be on the lookout for this dangerous pest, since it may very easily be brought across the line and the success of any effort to exterminate it, should it become introduced, depends upon its early discovery.

The adult weevil, or beetle stage, is about a quarter of an inch long, brownish gray in color, and has a long snout. The larva, or immature stage, which does the most damage, is yellowish green in color with a tiny black head, legless, and generally assumes a curved position. It will gentrally be found in the crotches or boots of the growing part of the plant, and any plant the leaves of which show feeding notches of insects should be examined.

Grapes in the Casa Grande district of Arizona have been tested for sugar content and found to contain 18 5/10 per cent sugar, the minimum requirement for which is 17 per cent.

MOSAIC OF POTATOES

As a result of investigations on the mosaic disease of potatoes by four investigators of the United States department of agriculture the following conclusions were reached.

The potato mosaic, although more common and apparently particularly destructive in certain sections of the United States, is nevertheless widely distributed in the rest of North America.

The disease has a decidedly detrimental effect on the yield. The characteristic symptoms of the disease are noticeable on the aerial parts of the plant, especially on the foliage. These symptoms may be modified or obscured by differences in environment or variety. Tubers of diseased plants transmit the disease. Grafting a healthy scion upon a diseased stock or a diseased scion upon a healthy stock may result in the development of the disease in the healthy plant.

Mosaic may be transmitted by transferring juice from a diseased plant to a healthy plant. The disease can also be transmitted by the agency of aphids. Mosaic apparently tends to increase the sugar content of the leaves and to reduce their starch content. Hill selection has not proved successful for maintaining healthy stock when practiced in fields in which there was a considerable number of plants attacked by mosaic. On the other hand, pulling up the infected plants before the aphids became numerous was an effective method for checking the spread of the disease.

COMING EVENTS

Frontier Days Celebration, Prescott, Arizona, July 2-5.
North of Bay Counties Fair, Santa Rosa, August 24-28.
Downey Community Fair, Downey, August 25-27.
Yuba County Agricultural Fair, Browns Valley, Aug. 29-31.
California State Fair, Sacramento, Sept. 3-11.

TRANS-PACIFIC BAGGAGE COMBED FOR PLANT PESTS

Arriving in San Francisco June 25 from the Orient via Honolulu, the Toyo Kisen Kaisha liner, Taiyo Maru, brought 777 passengers, the largest number carried into a California port by a single steamer in several years. The significance to the farmer and fruit grower lies in the fact that all the baggage belonging to 777 passengers was inspected not only for dutiable articles but for insect pests and plant diseases as well. With larger and faster marine transportation the fruit flies are being brought nearer and nearer to the California fruit industry.

A live farm bureau has been organized in Yavapai County, Arizona, and the following officers elected: L. L. Bates, president; David H. Biles, vice-president; Paul E. Lodge, secretary, and G. W. Hankin, treasurer.

Let the SUN give you plenty of HOT WATER

DAY & NIGHT

SEEMS impossible, doesn't it: But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home—mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept. E.

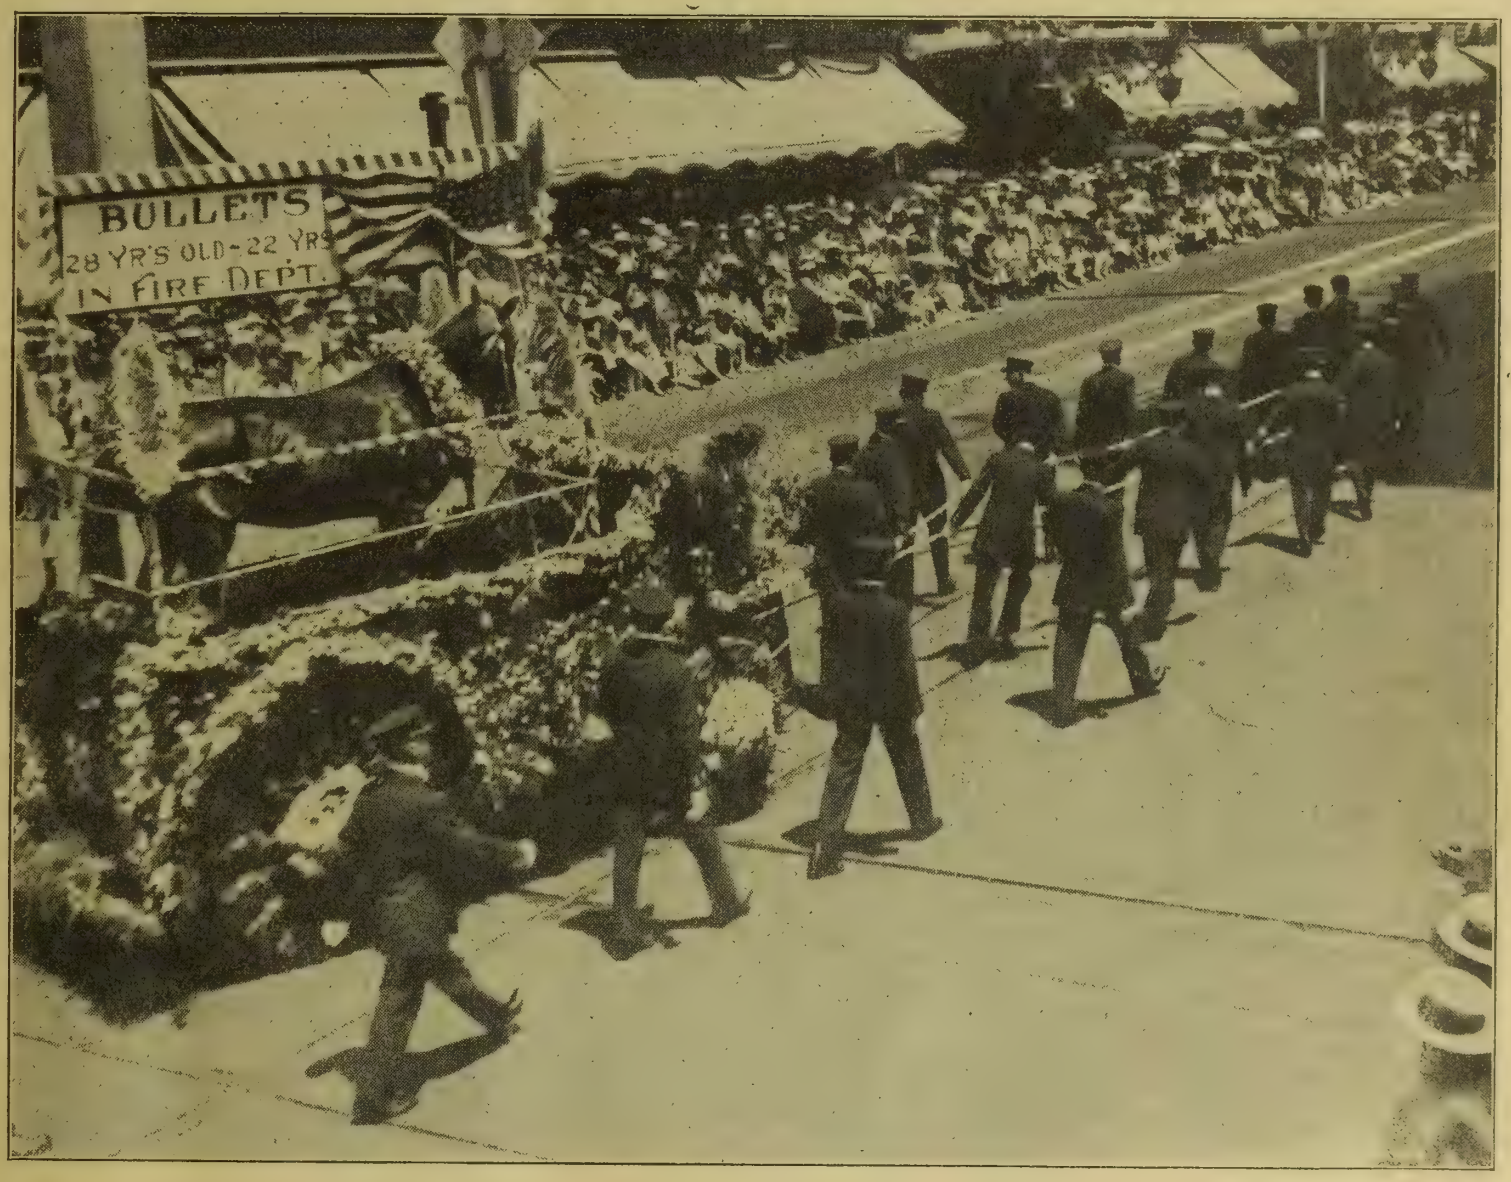
and LIVESTOCK and DAIRY JOURNAL

Los Angeles — An Illustrated Weekly for the Rural Home and Ranch — San Francisco

Vol. LVII — July 23, 1921 — No. 4



THE other day they had a great parade in Los Angeles. It was in honor of the Elks who were visiting the Coast, but there were many features in the parade which had local, or even wider, significance than the honoring of visitors to California. One of these was presented by the fire department. At the head of this section was a big banner borne by two of the firemen, inscribed, "Last Appearance of Los Angeles Fire Department Horses." Some of the horses were led in state, burdened only with decorative trappings; others in threes were drawing the old time steamers in golden harness and with golden reins. It seemed the proudest day of their lives, but there were tears in the eyes of many beholders. One, Old Bullets, was given honor above all others. He was the sole feature in a float decorated with thousands of gladiolus blossoms. Above him was the inscription, "Bullets, 28 Years Old, 22 Years in Fire Department." The motive power for this float was entirely from the strong arms of nearly a score of firemen, and on either side as guard of honor were other firemen.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

We have all seen rounder, trimmer, handsomer horses than the one who was honored as shown by the cover illustration. This faithful old worker shows his ribs somewhat but in lieu of beauty he has a record of service held by few horses. At six years of age he was purchased and put to work in the fire department of Los Angeles. Owing to his willingness and quickness of response he was given the name of "Bullets," and the gong had hardly sounded its first clang when he was under the harness. After nearly 20 years of continuous service he was deemed worthy of partial retirement and was placed on the "horseshoer's wagon." This is a big truck with forge and kit of blacksmith tools which went from station to station with the smithy for shoeing the various horses in the service. When an active service horse was taken out of his stall to be shod, Bullets for the time being took his place, and many was the time when in this special work he again answered the clang of the gong. His high intelligence fitted him for doing this pick-up work apparently as well as those trained in their particular stalls.

* * *

All the horses of the department in the city of Los Angeles are now retired to the parks of the city and the old steamer fire engines are being motorized, but the work demanded by the park department gives opportunity for partial retirement to these faithful servants.

* * *

The department of agriculture is realizing more than ever the need of more thorough investigation and the necessity of more helpfulness and thorough work in the matter of markets and other lines of farm economics. Secretary Wallace recently called a conference of workers amongst whom were Dean Thomas F. Hunt, Prof. G. I. Christie of Indiana, Prof. G. F. Warren of Cornell, Prof. Andrew Boss of Minnesota, and Prof. T. F. Cooper of Kentucky to consider the redirecting of activities of the department along economic lines. The members of this conference recommended more complete separation of regulatory work from research and service activities. Especially was attention given to the bureau of markets and crop estimates. These bureaus are giving actual service to food producers, and the extension of their work is to be commended.

* * *

Lee A. Strong, formerly chief deputy quarantine officer of the state department of agriculture, has been made chief quarantine officer and has transferred his headquarters from San Francisco to Sacramento. D. B. Mackie, formerly chief quarantine officer, will now devote all of his time to pest control, giving special attention to vacuum fumigation, the great success of which has been made possible because of Mr. Mackie's investigations and experiments during the past two years. Mr. Strong's work in San Francisco will be continued by George Compere.

DEEP CULTURE

There are times and there are crops which call for shallow cultivation, but we are thorough believers in deep culture. If there is a season of the year when the orchardist should follow shallow cultivation, it is probably the season through which we are now passing. The hot sun of July and August takes away moisture rapidly, and the dry dust mulch on top should be maintained without bringing up the moist lower soil. But it is only a short time until deeper work will be in order. Then let the plow, if necessary, take off some of the shallower fibrous roots. In doing so it turns some of the aerified upper soil down next to the ends of those roots and possibly with it some of the fertilizers which may have been applied to the surface. The new rootlets soon reach for this renewed soil and the available fertility made possible by the summer sun, and the roots which have been cut away are replaced by new ones. Besides, such culture makes possible the salvage even of those rains which may come with a rush in later fall, and it all makes for deep rooting and liberal growing of the cover crop. All orchardists do not agree with this, but try check rows with this method and others.

HIGHER STANDARDS

Standardization is resulting in a better reputation for California fruit and more money for the California fruit producer. The observations which have been made by standardization specialists are aiding the producer to do a whole lot of the standardizing before the products are delivered to the packing house. There is some wonderfully interesting reading in the article by L. J. Weishaar of the state inspection service in which he records some of the observations made on train accompanying shipment of cantaloupes to Eastern markets.

There has been serious effort to educate the producer, especially the Japanese, to harvest his fruit only when fully ripe. Mr. Weishaar's trip with the fruit has developed the fact that the "full slip" or, in other words, the fully ripened melon, rich in sugar and in food quality, ships just as well as the green "cukey" flavored half-slips. Even "dead ripes" carried to market under refrigeration perfectly, holding up two days after being taken from the ice.

If California can secure a reputation for shipping fully ripened cantaloupes, more money and quicker sales will result.

WATCH RUSSIA

Speaking before the board of directors of the executive committee of the American Farm Bureau Federation recently, Dean Hunt of California said:

"The world, the human race, is more dependent upon economic rehabilitation and direction of Russian agriculture than upon any other single material factor in the world. One hundred fifty million people are involved. I do not mean that the American farmer is going necessarily to suffer when Russia comes back, but the direction which our agriculture will take will be affected by the time and the way in which Russia comes back. The farmer who does not adjust himself to this new order is the one who is going to lose out. Watch Russia and study her.

"After most great wars there has been an upset of agricultural ownership in the countries affected. Landlordism in England arose after previous great wars, primarily because the little farmer did not have sufficient credit to carry on his work economically. The greatest single need of the American farmer today is adequate credit. For the good of the whole nation he should have improved credit facilities."

GREAT FIGHT

Congressman Osborne has wired the Los Angeles chamber of commerce in effect that the ways and means committee on Tuesday morning reported out amendments to the permanent tariff bill which are of vital interest to California producers. These amendments call for increases in the tariff schedule as follows: Shelled walnuts, from 5 to 7½ cents per pound; shelled almonds, from 8 to 12; beans, from 1¼ to 1¾; citric acid, from 10 to 12; citrate of lime, from 2½ to 7. Congressman Osborne adds: "Considering conservative inclination of committee, this is very considerable concession."

The daily press also refers to long staple cotton (1⅜ or longer) being recommended for a 15 per cent ad valorem duty in original bill on free list. Congressman Curry reports that the committee has granted him and his constituents a duty of one dollar per pound on Turkish tobacco. Of course, cotton manufacturers will do their utmost to have all cotton admitted duty free.

Eggs are still on the free list, and presumably there will be a big fight in this particular because American poultrymen have stood for Oriental eggs as long as they can. The great consuming public sticks to the point that America exports about the same number of eggs as she imports, but the Pacific Coast reminds the Eastern consumer that he has no idea of the vast number of eggs imported in dried or frozen form besides shiploads of fresh eggs from the Orient. We are promised several months of lobbying, oratory and several other things before the permanent tariff bill becomes a law.

CONSOLIDATING COMMISSIONS

Under the reorganization plan carried through the recent legislature and endorsed by the governor it appears that the work of something like 80 commissions or agencies will be brought together and performed by seven departments, according to the program just completed by the state board of control. The new plan of work will become effective July 30 when all the old state agencies will be dissolved and the new departments, chief of which will be the department of finance, will be in entire control. The department of finance will in a measure be the governing body and will comprise six divisions, including claims and disbursements, budgets and accounts, purchases and custody, motor vehicles, printing and libraries. The director of this department will receive salary of $10,000. Other departments are: Civil service, director's salary, $4,000; institutions, controlling homes for blind, asylums, etc. Then there are three departments under the general head of industrial relations: Industrial relations, with four divisions, including workmen's compensation, immigration and housing, industrial welfare, labor, etc.; department of public works, including a director and three members of the highway commission, whose work shall have to do with highways, engineering, water rights, land settlement and architecture, director to receive salary of $10,000; department of agriculture covering five divisions of plant industry, agricultural chemistry, animal industry, markets, weights and measures, director $5,000 per year. Then there is the department of education, with director and state board of education having charge of normal and special schools, textbooks and certification of trust funds, the director also having powers formerly held by trustees of all normal schools, state polytechnic school and school for deaf and blind.

STATE DAIRY COW COMPETITION WINNER

Word comes from Prof. Woll that the highest producing five grade cows in the state dairy competition in the month of June were owned by Nate Hauck of Alton, winning the Cultivator monthly $25 cash prize. The highest producing cow of the five is credited with 91.76 pounds fat. The average for the five during the month was 74.95. Particulars next week. This is the third month's consecutive winning by dairymen in Humboldt County.

Liquid Gas, Cyanofumer or Pots-Which Shall it Be?

By R. S. Woglum

LAST year there was considerable agitation at the beginning of the fumigation season over changing back from liquid gas to cyanofumer or pots. However, when the season got under way it was found that the Growers Fumigation and Supply Company of Pomona was the only large concern that was not using liquid gas exclusively, and this company used both cyanofumer and liquid gas throughout the season, starting each night with the liquid gas method but changing over to cyanofumer as the temperature fell below 60 degrees or thereabouts. A few other fumigators used the cyanofumers during the winter.

The present year there has been an unmistakable movement over a considerable area to change back from the liquid to the pot or cyanofumer method. This movement centers probably in the Covina-Pomona Valley. Other districts are less affected. Present indications, as based on information furnished by such well known fumigators as Wyman, Stowell, Lane, Platt, La Follette and others operating about 50 outfits, are that fully 50 per cent of the growers in that district are demanding pots or cyanofumers this season. The fact that this contemplated change centers in the district which has long been foremost in magnitude of operations causes not a few growers in all parts of California to question the desirability of continuing with the liquid gas method of fumigating.

But why this demand for a change? The compelling reasons which lead intelligent growers back to former methods are plainly apparent if you would picture yourself a grower in that valley who fumigated two years ago with poor results, and again last year without commercial control of the scale, and possibly have neighbors who fumigated not once, but twice, last year and still have too much scale left for the good of the trees. When these same growers look back ten years and recall effective scale control by pot fumigation, sometimes necessary only every other year, and realize that their recent failures have been most conspicuous since liquid gas has been widely used, it is entirely reasonable for them to question the value of this recent innovation as compared to former methods. The successful grower builds upon facts and facts only and the scale on his trees and continued smutty or scaly fruit are to him concrete evidence of failing fumigation.

It seems to me that the time is ripe to lay all the cards bearing on this uncertain problem on the table, look them straight in the face and then try to see where the joker falls.

General Opinion Regarding Liquid Gas

The general opinion of men actually directing fumigation and of those investigating the results in districts where scale control is extensively practiced appears to be about as follows:

Tulare County—Citricola scale only—results quite satisfactory where work done during the proper season, i. e., before September. Will continue to use liquid.

Ventura County — Results at least equal to those formerly had with cyanofumer and pots. Will continue to use liquid gas.

(Continued on Page 78.)

Observing Cantaloupes in Transit

THE state department of agriculture has made investigations in order to clear up some misinformation regarding behavior of fruits under refrigeration, and especially during shipment from Imperial Valley to Eastern markets. In order to secure daily information Mr. Hecke assigned Mr. Weishar, supervising inspector of shipping point inspection, also collaborator of the federal bureau of markets, and Mr. Weishaar accompanied the car from shipping point to consuming point. The story of his experience is interesting. From it we quote:

By L. J. Weishaar, State Inspection Service.

We left Brawley about eight o'clock in the evening of Thursday, June 16, and arrived in New York on Sunday, June 26. An excellent schedule is maintained as far as Chicago. Switching there and subsequent delays consumed practically four days to New York.

While interested in observing temperature readings in transit and the amount of ice consumed in the refrigerator cars used in this test, my attention was given also to other points on which I decided to get thorough first hand information.

Season after season there has been considerable agitation regarding the shipping of immature cantaloupes. In receiving markets we recognize two disastrous stages—too green and too ripe cantaloupes. The prevailing fear at shipping point seems to be that cantaloupes will arrive overripe. We hear very little at shipping point, but a great deal at destination, about immature cantaloupes.

Before beginning the test trip I spent three days visiting fields in the Imperial Valley in order to obtain a good idea of the quality and condition of the crop in various fields. Stopping at the packing sheds and cutting many cantaloupes which were ready for packing revealed the fact that most stock showed scarcely a tinge of yellow or salmon in the meat and not the slightest turn in the color of the seed. The flavor of such stock was 100 per cent "cukey." Showing these specimens to the Japanese and warning against packing of such immature cantaloupes invariably elicited a reply something like this: "If five or six days on road, melon ripe." This theory seems to flourish wherever cantaloupes are grown. It needs to be exploded.

In the test shipment we selected melons in varying stages of maturity, "half slips," practically immature stock; "full slips," mature, hard, well netted cantaloupes, lastly "dead ripe" choice yellow appearing stock. All these were placed in the car center to ascertain just what advance in maturity would take place under refrigeration on the ten day trip. The outcome of this test may surprise many. Not the least advance in maturity was noticeable at destination in any of the three grades of cantaloupes. "Half slips" cut whitish or occasionally a pale yellow but remained distinctly "cukey" in flavor. After several days most of this stock acquired a thin layer of pale yellow meat, became slightly soft, yellowish on the outside, but never developed sweetness or good flavor. The "full slip," well netted cantaloupes were taken from the refrigerator car, kept in a room temperature for two days, then placed on ice, and were in ideal condition, with excellent flavor, on the third day. A rich yellow meat extended practically to the rind. The "dead ripe" cantaloupes were taken from the car and remained in good edible condition during the next 48 hours, but began to break down rapidly after that and became soft and mushy. The "full slip" well netted hard melon gave by far the best account of itself, was of excellent quality and in ideal condition for reshipment at New York and would most certainly have given the consumer a good idea of the true flavor of a California cantaloupe.

"Wrapped" cantaloupes verus "not wrapped"—another point on which much discussion has been spent. Investigations by the U. S. department of agriculture have definitely established the advantage of not wrapping cantaloupes. The present test serves to confirm these. Wrapping does little or nothing to prevent sunburn (opinions to the contrary notwithstanding), but on the other hand, wrapping tends to preserve the field heat in cantaloupes, impedes refrigeration, prevents normal evaporation of moisture, thus affording every chance for fungus and bacterial infection, softening, and decay. A sticker or similar device for advertising the brand would be less expensive and equally attractive and would materially reduce decay and mold now caused by wrapping.

No one advocated indiscriminate opening of refrigerator cars en route and there is much conjecture as to the effect of such action. In a car left open half an hour with an outside temperature over 100 degrees, an extreme variation of 20 degrees took place in the air temperature of the car near the ceiling, but a variation in the fruit temperature of less than two degrees in the top of the load. No variation in the air or fruit temperature occurred in the bottom layer or at bunkers. One hour after the car was again sealed, the air temperature in the car was within three or four degrees of normal and all fruit temperatures practically back to normal. Cantaloupes thus exposed showed no change in condition at destination from those in unopened cars and sold at equally good prices.

All of the above facts are based on an experiment with cantaloupes shipped out of the Imperial Valley about the middle of the present (1921) shipping season. Different seasons bring with them varying climatic conditions and new problems. As indicated before, there remains a vast field to be covered by practical investigations in the transportation of fruits and vegetables. Sincere, unprejudiced, thorough endeavors will benefit the industry and ultimately create a wider demand than exists even now for California products.

One of the most prominent cantaloupe distributors in the East believes that acreages of cantaloupes in California would positively shrink because, he explains, the demand is slowly but surely slackening because of the shipment of immature cantaloupes. McCutcheon, the well known cartoonist of the Chicago Tribune, just recently voiced the sentiment of the consumers in that city by presenting to the several million readers of that publication a forcible caricature, showing the poor quality of California cantaloupes. Advertising such as this does not stimulate demand or consumption.

Not a whit more encouraging is the attitude expressed by another dealer whom I had occasion to interview. He leases an acreage in Imperial Valley and ranks among the largest distributors. He released his sentiments in this manner: "We invest our money in certain lands in California and naturally look for a return of our investment with a profit. We resent having any state or other official tell us when or how we may ship what we produce. We realize that green cantaloupes, though not as palatable to the consumer as ripe ones, carry better to long distance markets, can be turned into money by the salesman, and that is what we are after. The ultimate result—when the deal becomes unprofitable, we will discontinue our acreage and operate somewhere else."

Do you believe that this dealer is doing justice to himself and to California interests?

Agricultural News Notes of the Pacific Coast

Northern California

Chico reports a bumper crop of figs.

A $30,000 grain fire is reported from Colusa last week.

The new standard apple act becomes effective August 3.

The Grass Valley, Nevada County, auto park is now open to travelers.

The highway from Grass Valley to Auburn is closed by construction work.

Alturas, Modoc County, reports plenty of help available in harvest fields.

A concrete highway is to be built west of Walnut Creek, Contra Costa County.

Producers of dried apples are signing up their crop with the Sebastopol Apple Growers Union.

Work has begun on the $150,000 addition to the Mendocino state hospital building at Talmadge.

State Sanitary Inspector Ross is making inspection of auto park facilities in all sections of the state.

The "Valley of the Moon" chamber of commerce has staged a three day carnival at Sonoma the latter part of July.

Large sales of barley are reported from Colusa at $.95-$1.03 per hundred against last year's price of something over $3.

Horticultural Commissioner Turner of Placer County reports planting of over 34,000 plum trees and nearly 30,000 pears.

The Larkin farm center has decided to purchase a moving picture machine; also to exhibit at the Glenn County fair this fall.

Chief Deputy Quarantine Officer Strong has inspectors on the Nevada line on the lookout for alfalfa weevil in camping equipment.

The California Pear Growers Association announces sales of pears at Sacramento river points at $2.15 to $2.25; in Contra Costa County, $2 per packed box.

Prices to canners have been fixed by the California Growers Association: No. 1 Bartletts, $61.75; No. 2, $33.25. Last year's prices were $100 and $85.

Peach growers of Carmichael, Fairoaks, Haggin Grant and Elk Grove have formed a marketing pool to handle their 1921 crop in dealing with the canneries.

California's pear crop this year is estimated by the California Pear Growers Association at 76,000 tons, as against 94,000 tons last year and a normal crop of 130,000.

The board of supervisors of Nevada County has denied the petition of withdrawal by owners of at least ten per cent of the land included within the Grass Valley irrigation district.

Recent election by California Prune and Apricot Growers Association shows choosing of the following directors: C. C. Spaulding, Hugh S. Hersman, Robert Britton, J. S. Williams, Warren E. Hyde, J. A. Chargin, C. C. Lester, J. R. Welch, J. C. Shinn, G. W. Glendenning, Paul Marston, R. P. Van Orden, I. O. Rhodes, Leroy Anderson, I. E. Pomeroy, M. J. Madison,

Central California

The 1920 census shows that Inyo County has 521 farms valued at nearly $12,000,000.

The farm bureau picnic at Alisal Park, Monterey County, brought out an attendance of 2,500.

Game Warden Post reports both old and new roads from Soledad to the Pinnacles in excellent condition.

The first solid car shipment of fresh figs from California netted the growers $400 a ton. It was of Black Missions.

One of the newest cooperative organizations is the Lindsay-Strathmore Pomegranate Association, with 45 members.

A new cooperative citrus association has been organized at Strathmore. A modern packing house will be erected.

Harry Stadler has been put in charge of the squirrel poisoning campaign in the El Nido district of Merced County.

Dust explosion in a combined harvester on Deer Creek resulted in completely destroying the harvester and burning an acre of grain.

Funds are now available for purchase of the experiment vineyards at Fresno and Oakdale formerly leased by the federal government.

J. W. Nelson, assistant state leader of farm advisers, has been in Merced County addressing local centers on soil handling, irrigation problems, etc.

The state highway commission has let bids for construction of the 19 mile strip over the Pacheco Pass from Los Banos to the Madera County line.

A bill has been introduced by Congressman Barbour to extend Sequoia national park from Mt. Goddard on the north to Kern Canyon on the south.

Pink rot fungus of onions is reported from fields in the San Joaquin delta. A rather severe attack is indicated by statements received from growers.

The 1920 census shows the value of farming lands and buildings in Monterey County to be $53,131,338, an increase of 76.7 per cent over the 1910 valuations.

All of the private holdings within the Sequoia national park have been pruchased and given to the national government for the enjoyment of the American people.

Home Demonstration Agent Evelyn Conklin is talking and demonstrating different methods of home preservation of foods in the farm home department meetings in Kings County.

The controversy of several years standing between the Southern Sierra Power Company and water users of Bishop Creek, Inyo County, has been settled by decision of arbitrator chosen by the contending parties. The water users feel that their rights are now secure.

Special buildings for automotive and home manufactured product exhibits will feature this year's Fresno district fair, September 26 to October 1. A huge tent, 540 by 100 feet, will house the tractor machinery, and another big canvas will cover the pumping and irrigation exhibits.

Southern California

Farmers of Talbert, Orange County, report many thefts of cattle, especially calves.

Mrs. Malinda Woodworth is now home demonstration agent in Riverside County.

Black scale parasites are being distributed to Venturans who have citrus trees in their yards.

A new pump and engine is being installed at the community well at Wintersburg, Orange County.

The Orange County supervisors have awarded contract for construction of bridge over the Santa Ana near Olive.

The San Dimas Lemon Association shipped last month 100 carloads, the estimated season's shipment being 850.

Lima bean growers have been given reduction in railroad freight rates as a result of their use of water transportation.

Saidy date offshoots will be distributed to growers in the Coachella Valley under contract with the federal government.

Fruit packers at Orange, went on strike because the scale for packing oranges was reduced from 6 to 5½ cents per box.

The Riverside County road between Banning and Indio is being repaired and is now in fair condition north of Palm Springs.

A bill has been introduced in congress to make 1,600 acres in the vicinity of Palm Canyon, Riverside County, a national monument.

The Yucaipa Valley Fruit Company has begun construction of packing house that will double its capacity for handling the coming apple crop.

Improvements on the warehouse of the Carpinteria Walnut Growers Association have been finished. New culling apparatus has been installed.

Farm Adviser Nebelung of Riverside County has resigned to take up work in citriculture with the government of the Union of South Africa at Pretoria.

The Elsinore Valley Water Users Association has decided to fight the water development plans of the Lake Hemet Water Company in the San Jacinto mountains.

The ways and means committee has agreed to offer to the House an amendment providing tariff of 15 per cent on cotton. On 50 cents a pound cotton this will mean a duty of 7½ cents.

Imperial County farm bureau has organized a marketing exchange to operate on a commission basis. It will first take up marketing of veal calves which are bringing practically nothing from the butchers.

The Orange County farm bureau has been seriously considering the farm labor situation. Hundreds of Mexicans are said to be leaving for the vineyards of San Joaquin Valley, and many are returning to old Mexico.

The Festival of Dates to be held at Indio, October 21-23 will show exhibits from foreign countries. The United States department of agriculture will assist in securing a representative collection of dates and date products.

The Coast and General

Losses of livestock in the southern part of Arizona have been reported, due to the prolonged drouth and high temperatures.

Ten thousand feet of timber was destroyed by fire in the area between the Copper Basin and the Thumb Butte in the Prescott national forest in Arizona.

A big sales promotion campaign has been launched by the Association of Hawaiian Pineapple Packers to promote use of crushed and grated pineapple.

The annual picnic of the Lewis County, Washington, Pure Breeders Club will be held at the Southwest fair grounds July 27 at the time of the dedication of the new stock barns.

Under the auspices of the state farm bureaus of Washington, Oregon, Idaho, Montana, California and Utah, a three day conference was held in Portland to work out various fruit growing problems.

Strawberry growers of western Washington are hard hit by refusal of canneries to accept strawberries. It is reported that growers in the Olalla Valley have been forced to leave as many as 30,000 crates unpicked.

The Florence diversion dam in the Gila River of Arizona will provide irrigation water during the coming year for 62,000 acres in the Florence-Casa Grande Valley. It is estimated that the dam will cost between $750,000 and $1,000,000.

The farm bureau of Gilbert, Arizona, held a basket picnic June 25. After the picnic a cow judging contest was held. The farmers seem to be taking much interest in dairying and probably will form a cow testing association shortly.

Carlot shipments east of fruits and vegetables from territory west of Ogden, Salt Lake and El Paso and south of Ashland, Oregon, have broken records this season. During the past June 3,424 more cars moved in refrigerator cars of the Pacific Fruit Express than in June, 1920.

The first shipment of asbestos in several months was made recently from the Globe district of Arizona. There has been little demand for this product in the past few months and Arizona is said to produce more asbestos than any other state. The recent shipment was a very high grade.

The fourth annual convention of the Western Plant Quarantine Board, which was held this year at Victoria, British Columbia, will be held at Phoenix, Arizona, in May, 1922. Delegates are expected from British Columbia, California, Idaho, Oregon, Utah, New Mexico and Washington, Colorado, Montana and Nevada.

The Washington Wheat Growers Association at its recent meeting in Spokane elected the following directors: N. F. Sturgess, Rockford; W. W. Arlt, Marcellus; R. M. Jones, Dayton; H. E. Goldsworthy, Rosalia; R. V. Peringer, Belmont; T. S. Hedges, Waterville, and C. N. Campbell, Bridgport, tied; J. H. Smith, Ephrata; J. C. Kaidera, Centerville; Oscar Collins, Pullman; H. Jurgenson, Wilbur; W. H. Kirkman, Walla Walla; N. B. Atkinson, Waitsburg, and James Oliver, Pomeroy.

Home Canning of Fruits

By W. V. Cruess

NO pantry is complete without a generous winter's supply of home canned fruits. Particularly is this true for California. Fruits and sugar this season are selling for very low prices and it is therefore a home canning year.

Use Good Fruit

If you own your trees or have access to an orchard by all means select the fruit yourself and can it the same day that it is picked. Fresh ripe fruit is the prime requisite in canning as well as in the preparation of all other fruit products.

Lye Peeling Peaches

It is usually not necessary to lye peel peaches for home canning, because the small quantity does not warrant, but where several boxes are to be put up this method is economical.

Use an agateware or iron pot; never tin or aluminum. To one gallon of water add one-half pound of lye. Heat to boiling and immerse the peaches in the lye until the skin will slip easily, 20-30 seconds usually. A wire basket or a lard bucket punched with holes will serve for holding the fruit. Rinse in an abundance of cold water and rub off the skins. Halve and pit the peeled fruit and store in water until canned to avoid darkening.

Preparing Other Fruits

Berries need only be washed and sorted; apricots washed and cut in half. Pears are hand peeled, halved and cored. Special coring knives may now be had from hardware stores. French prunes are excellent when canned fresh and require no preparation except washing.

Precooking

Most fruits, peaches and pears excepted, shrink badly and give a partially filled jar or can if packed fresh into the container and sterilized. These fruits should be given a short cook before going into the can. The syrup in excess of that needed to fill the jar can be bottled and used later for cooking or on the table.

The fruit is placed in a kettle with the required amount of sugar. To berries no water is added. To plums, apricots and other pulpy fruits enough water is added to form a syrup with sugar sufficient to cover the fruit after boiling. Boiling must be brief, usually not more than two to three minutes; long enough to soften the fruit and not long enough to break it into pieces. Berries and sour fruits require an equal weight of sugar while less tart fruits are given one-fourth to one-half their weight of sugar.

Figs are better preserved than canned. See our article on preserving in a recent issue of the Cultivator.

Jars or Cans?

For home canning the writer prefers the glass top jar with wire clamp such as the "E-Z Seal," etc. These jars last a lifetime. Caps do not have to be renewed. The jars are convenient for sterilization on account of the clamp top feature.

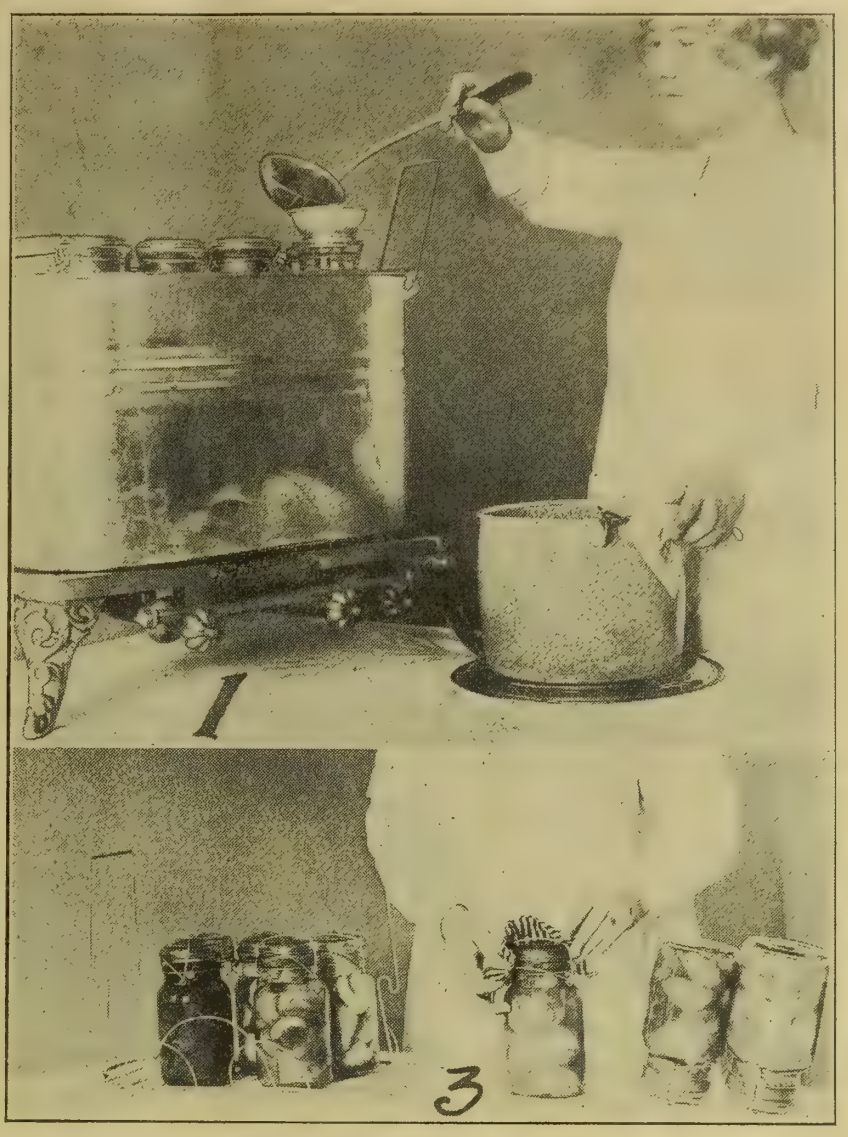

Fig. 1 and 3—Canning by Pictures

Upper photo illustrates a convenient type of wash boiler sterilizer and jar rack and the filling of the jars with the heated fruit preparatory to sterilization. Lower shows method of sealing and cooling glass top jars after sterilization. (All of these illustrations are from Home and Farm Food Preservation by W. V. Cruess. Macmillian Company, publishers.)

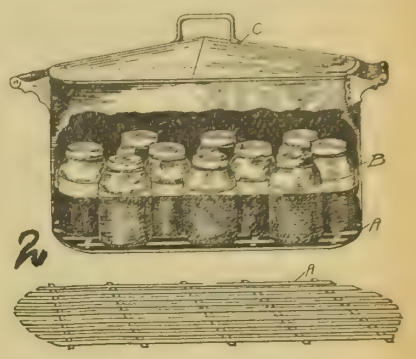

Fig. 2—Using the Old Wash Boiler

This is a sketch showing a home made jar rack in place in a wash boiler sterilizer and indicates also the depth of the water in the boiler.

Use only the best rubbers. The Good Luck and Cold Pack brands can both be highly recommended. Poor rubbers will spoil the flavor of your fruit.

If a large quantity of fruit is to be put up cans are very convenient. Small home size can sealers are now available. Several families can afford to club together and purchase one of these outfits where the expense is too great for one. We have one in our laboratory which cost us about $15. It has proven satisfactory. The style of can used is the "open top" or Sanitary can. No solder is used in sealing it.

Filling

Peaches, pears, firm apricots and cherries are packed into the jar or can cold. Boiling hot syrup is added to fill the container. This syrup consists of one cup sugar to three cups water unless the fruit is very sour. Cherries are apt to shrivel in very heavy syrups.

(Continued on Page 84.)

Paint Preserves and Beautifies

PERHAPS the first thing to say as to the advantage of slicking up and painting the farm buildings is that it saves money. But that is a side of the question we will not touch at this time, but only the greater comfort and pride which one may have in the home as sufficient justification for spending a bit of money on paints and varnishes; also on painters and varnishers, if one so prefers, but there are a lot of us in this world that cannot employ others to do our work as much as we would wish so are compelled to hunt up the old paint brushes, some of them hardened with left-in paint, and soak them up in the prepared solutions which are promised to make them pliable and workable again, then get busy and do our own painting. We would, however, suggest where possible employment of one qualified to do a thoroughly good job.

But, admitting our willingness to endure grimy hands, get into disagreeable work and suffer from a bit of ache in the back and neck, we may add a lot of comfort to our homes. And we mean comfort, for there is genuine restfulness and joy in the well painted and tastefully arranged home. And we don't know that there is need for personal discomfort or ill appearance because of the dirty job. Old canvas, or even cast-off garments, may be used to cover floor or furniture, and coveralls or old duds to prevent soiling of everyday clothing. Gasoline, turpentine or a smear of lard will usually clean hands and face.

Almost since painting began oil and lead have been considered the best foundation. Of course, there are tints and colorings of all kinds to be added, and varnishes, enamels and other coatings necessary for certain conditions, but the best part of it all for us who are novices is the fact that every paint and most general stores have a full line of all tints and colors and varnishes all ready to drop the brush in and apply. And the handlers of these paints as a rule have a fairly good knowledge as to their application and can give more immediate and timely advice than is possible in a general article.

But a few hints, some of which have come in answer to questions sent to the offices of some of the larger paint and varnish manufacturers of the country.

The first step is to prepare the surface on which the paint is to be applied. If it has been covered for many years by many coats it has perhaps begun to flake or peel off. On this point "Painting, Protective and Decorative" by the National Lead Company says:

"The life of a paint that scales in patches must be deemed as terminating when first scales begin to drop off, not by the length of time some of it will cling; for repainting must be done at once if the wood is to be saved. Not only so, but a cracking, scaling paint entails trouble and expense when repainting is necessary. The painter finds some of the paint clinging like glue, while in other spots the wood is bare. He must smoothe the whole surface by scraping or burning, which is dangerous and expensive. An old surface painted with white lead is ready for new paint as soon as the accumulated dust is brushed off."

If, however, it is a varnished surface, and the natural wood is to be preserved, neither the scraping, and certainly not the burning, may be permitted. It then becomes a case for "paint removers" or turpentine or sandpaper. If the surface is weather stained, and a lighter, more natural shade of the wood is desired, a hint is given as to the oxalic acid treatment in the letters given below:

For floors, only floor paint should be used; for porches and steps, outside floor paint; while "inside" or quicker drying paint may be used for all interiors. Many folks regard paint as simply paint, without taking into consideration the fact that one may be perfectly adapted for outside work and entirely unsatisfactory inside. Never use turpentine for outside work.

But these are only hints. More and better information is given in the letters which follow, which are in answer to numerous queries which have come to this office from Cultivator subscribers:

The Questions

1. "I want covering for my back porch floor where the men's rough

(Continued on Page 90.)

Announcing an Expert Field Service for Southern California Groves

Field-tested methods for controlling citricola scale are now offered to you by Balfour, Guthrie & Co. A clean-up campaign throughout the fruit-producing districts of Southern California will be conducted from the Company's headquarters in the H. W. Hellman Building, Los Angeles. Have your grove examined free of charge by Frank B. Herbert, assistant entomologist, and his aides. They will advise all growers desiring information about

Spray Control of Citricola Scale, Black Scale, Red Spiders

Prepare at once for your bigger profits this year. Apply to YOUR problems the results of actual field work and scientific research secured by Balfour, Guthrie experts under Chief Entomologist Paul R. Jones. They have established the supremacy of Universal Orchard Spray for citricola scale control. It was used on 20,000 acres of groves in Tulare County last year—and Tulare won thereby the record of being the cleanest citrus county in California.

Your grove, too, will look best and produce the most fruit through continuous use of Universal Orchard Spray. Mr. Herbert will work shoulder-to-shoulder with you. He will center his attention on YOUR spraying problem—no other business as a side-line. Strengthen your trees, encourage healthy foliage and so assure your bigger harvest. Attain these results by employing the time-tested methods of a long-established California business institution. Remember! Balfour, Guthrie experts are back of you in this campaign.

Send today for your free copy of new citrus bulletin prepared by our expert entomologist, Paul R. Jones

LIQUID GAS, CYANOFUMER OR POTS—WHICH SHALL IT BE?

(Continued from Page 75.)

Orange County—Results quite satisfactory against purple and black scales or equal to former work with cyanofumer and pots. Red scale becoming more difficult to kill. Will continue to use liquid gas.

Riverside County—Satisfactory work against the black, also the Citricola in early season. Some late Citriola work poor. Red scale toward Corona difficult to control. Will continue with liquid gas.

San Bernardino County—Eastern: Early Citricola work good. Late work less satisfactory. Western: Work spotted and considerable unsatisfactory against both black and Citricola. Demand by some growers for pots or cyanofumers.

Los Angeles County—Already presented by Commissioner Ryan. In a broad strip of territory extending from Azusa to Covina, and Covina through Charter Oak to Claremont, results against black scale generally unsatisfactory. Strong demand for pots and cyanofumers.

The results of all counties when condensed show the general results of the past season to be about on par with former results; on the other hand there have been certain conspicuous failures. These are that late fumigation for the Citricola scale is decidedly less satisfactory than early fumigation. The red scale in certain sections of Riverside County and in Orange County are becoming very difficult to control by fumigation. And the results against the black scale in certain of the eastern interior citrus sections of Los Angeles County are highly unsatisfactory in spite of high dosage used. Furthermore this area of unsuccessful black scale control appears to be extending both eastward and westward from the original center.

Pots vs. Liquid Gas

At a recent meeting of fumigators held at Glendora it was practically the unanimous opinion of those present that liquid gas produces scale kill about equivalent to cyanofumer results and better than pots. Professor Quayle's published results put the liquid on an equal footing with the former methods of cyanid gas generation.

My own experience with liquid gas agrees substantially with the majority opinion of fumigators and students of fumigation. When associated with the federal department of agriculture I conducted very extensive experiments, comparing the results of pot work and liquid gas under varying weather conditions, and surely no experiments could be more carefully performed or more accurately checked. Several months were spent by myself and assistants on inspection right in the field, and scale bugs were examined by the tens and hundreds of thousands. Every comparative test that we performed at warm temperatures with high grade material, accurately measured and carefully applied—where one row of trees was fumigated with pots and the next with liquid gas—showed more uniform scale kill and slightly better results with the liquid. Let me cite one example typical of these results: Nine full days were spent in this particular orchard by Mr. Rounds and myself inspecting the kill against the purple scale by fumigation at temperatures of 60 to 66 degrees Fahrenheit. The liquid gas showed all insects killed and 95 per cent of the scale with all eggs killed, whereas with the pots and the same schedule a few insects remained alive and only 75 per cent of the scale had all eggs killed; in short, only five per cent of scale treated with liquid had any eggs come through living, whereas 25 per cent of the scale treated with pots had some eggs escape.

It should be emphasized that these superior results with liquid gas were secured at warm temperatures. When work was done in damp, cold winter weather the results were less satisfactory with the liquid than with other methods.

Now you recall the good results secured years ago with pots. But it should be recalled that the very effective results with pots in those days were secured with potassium cyanide when the total expulsion of gas occurred in two or three minutes. With sodium cyanide, which we now use, and which is alone available, the gas generation in pots continues over a period of 10 to 20 minutes, and in the light of the gas diffusion studies recently made by Dr. M. J. Brown of the Pacific R. & H. Company and Mr. J. D. Neuls, that the rapid diffusion and concentration of gas during the first few minutes of exposure has a very important bearing on effective scale kill, there is presented a reason for not expecting as good results with sodium cyanide as with potassium cyanide in pots. And doubtless many of you recall the frequent complaint of poor results in the case of small trees when cyanegg was used in pot work. When machine generation was introduced it was heartily welcomed and considered a step in advance over the pot method with sodium cyanide.

When we review the outspoken experience of fumigators toward the pot method it is reasonable to feel that this method with sodium cyanide has had its funeral. It can be resurrected from the graveyard and will be in not a few cases, but after this season is over and further critical evidence accumulates, my own experience leads me to feel that the system is quite likely to then be definitely embalmed.

The Covina Valley

Now the problem of unsuccessful fumigation in the Covina-Pomona Valley can scarcely be attributable entirely to liquid gas. There have been failures, to be sure, and not a few either, due to some fault of the liquid system, or to careless operation, but the chief cause for poor results appears to be an increased resistance to fumigation which the black scale is developing or has developed. Mr. Wyman used both the cyanofumer and liquid gas throughout the season and in checking up the results of the two methods in some of this so-called resistant scale territory one is unable to detect any particular superiority of one method over the other, especially so during the warm season. In orchards in which the scale is considered resistant the results were frequently noted as poor with both methods. Furthermore, one large orchard in this district fumigated with pots and very high dosage, gave results far below commercial requirements. Additional evidence has been supplied by Mr. Borden of the federal department of agriculture, who followed work done in several orchards last autumn with cyanofumer and liquid, and his determinations showed unsatisfactory results in every case with both methods, even where 100 and 110 per cent dosages were used. It is well known that for control of the red scale at Corona fumigators speak in terms of 110, 125 and even higher per cent schedules, yet Professor Quayle has stated that the resistant black scale at Charter Oak is even more resistant to cyanide gas than the red scale at Corona. Therefore, it would appear that the unsuccessful results against the black scale in western Los Angeles County are due more to the type of insect being developed there than to the system of fumigation followed. As a possible ray of encouragement to growers in that district let it be stated that for them fumigation is by no means at the end of the rope, for experience to date with the outfit of gas tight tents being operated by the field department of the California Fruit Growers Exchange in the resistant red scale district of Riverside County is encouraging, as will be shown by the report of Professor Quayle.

The Cyanofumer

The cyanofumer must be considered a step forward over pots with sodium cyanide, for the gas generation is almost instantaneous. It is by no means a perfect machine but after due allowance is made for its principal weaknesses, which are reported to be considerable, gas absorption by the acid water mixture in the lower drum when it cools too much, and occasional improper functioning of the spring valve which would short the dosage, the general results which followed the period of its widespread adoption appeared to be quite satisfactory. Evidence appears to show that fumigators who decide voluntarily, or are com-

pelled by grower demand to return to former methods of generation, are likely to pass a more successful season and better please their growers with the cyanofumer than with pots. Furthermore, if fumigation concerns are compelled by grower demand to use liquid, cyanofumer and pots, all three, not only will the overhead be excessive, but so much confusion is likely to arise and improper schedules be followed and slipshod methods creep in as to result in decreased efficiency and inferior results. In fact, it cannot but be admitted that the managers and directors of fumigation companies are justified in refusing to use more than two methods.

Disadvantages of Liquid Gas

Although the majority of those who closely observe the results of fumigation appear to be agreed that liquid gas is equal, if not superior, to cyanofumer or pots during warm weather, it must be frankly admitted that the application of this material has been far from the perfection desirable. The material has been of uniformly high grade, but the loss occasioned in its measuring in the orchard and in its change to gas beneath the tree not infrequently has seriously impaired the results against the scale. Applicators in the field last year were far from satisfactory and gross errors were by no means infrequent. In fact, it was apparent to me early in the season that the faultiness of applicators was a matter of serious concern that demanded continuous and close attention to maintain high quality work, but such attention was too often not supplied. Both concerns that furnish liquid gas this year assure improvement in applicators over those of last season, one by improving the fittings and connections of the pump used last year, the other by introducing an entirely new applicator. Our observations of the different applicators now used with the Exchange gas tight tents outfit are that they will all be reasonably accurate. There is a model applicator used by one fumigator, but unfortunately not put out on the market, which has features seemingly superior to the types now available.

Next to accuracy of applicators comes the atomization of the liquid beneath the tent. Where this hits the leaves of the trees, cover crop, or other obstacle, a certain amount is condensed into liquid or ice. At warm temperatures the loss is usually insufficient to seriously impair results, but at cold temperatures the loss not infrequently has been observed to materially reduce the efficiency of the dosage. This has appeared to me, from the first use of liquid gas, to be its greatest drawback. The careful use of liquid with accurate applicator during the warm months of the year appears to give quite satisfactory results. However, where fumigation is done during the cold winter months the direct introduction of gas as by cyanofumer or vaporized liquid cannot fail to prove superior in the long run to the atomization process.

With liquid gas as now applied the gas concentration and scale kill is greatest at the tree bottom. With some scales, as purple, this is a decided advantage, but with the other scales uniformity of distribution would be more desirable.

The system which will ultimately be demanded by the grower and fumigator alike is one which most accurately and uniformly puts the required dosage of cyanide gas beneath the tent. This can be most closely approximated by accurately measured liquid hydrocyanic entirely changed to gas before entering the tent. Such a system would dispose of the major disadvantage now checked up against the liquid and also include its present advantage over the pots and cyanofumer. A step in this direction has been made by one of the liquid gas manufacturing concerns in the form of a light weight vaporizing machine. This machine is now being tested in the field but definite conclusions as to results against scale, practicability of operation and durability, will be gained only with more extended experience.

Resume

None of the fumigation methods is perfect, but of the three now available, liquid, cyanofumer and pots, when all things are considered liquid gas stands first, and pots with sodium cyanide last. However, during cold, damp weather liquid gas is not uniformly satisfactory when sprayed beneath the tent. Under such conditions superior results should follow changing the liquid to gas before entering the tent. If this is not done many fumigators believe the cyanofumer would be more effective during such weather. The partial return in some districts from liquid gas to cyanofumer or pots is certain to have a stimulating influence on the concerns manufacturing this liquid product, to perfect apparatus for accurate and complete conversion of their product to gas under all atmospheric conditions. Liquid gas applicators appear superior to those of last year.

BUY PLANTS AT HOME

By Charles H. Vary

FOR a number of years the press throughout California has been publishing articles relative to the good work of the state horticultural quarantine service. It has called the attention of the public to the fact that the horticultural and agricultural interests are second to none in the state, and in view of this fact it has repeatedly emphasized the importance of keeping out new and dangerous insect pests and plant diseases which are liable to be introduced into the state by bringing in plants or other horticultural material from areas which are known to be infested or infected.

Notwithstanding, the quarantine officers of Los Angeles and other ports of entry in the state are constantly intercepting and condemning objectionable material which, if allowed to proceed to the consignee, might and probably would in very many cases be the nucleus of starting an infestation which would cause inestimable damage to our agricultural interests.

A large percentage of the objectionable material intercepted by the quarantine officers which arrives from other states is of little value from the monetary standpoint, and the same plants can usually be procured from a local florist or nurseryman without the danger of introducing new pests. Sentiment is responsible for many of the packages of nursery stock which find their way into California. Someone remembers how good the grapes used to taste from the old vine that grew on the stone wall back in the home garden when he was a boy, or someone never saw a rose in California that equaled the one that grew under Mother's bedroom window way down South, and another must have a root of some little shrub that is planted by the grave of a dear friend in some little country churchyard. And so they come, plants from every state in the Union, gathered from farms, gardens and woodlands, to say nothing of the immense volume of nursery stock brought in from nurserymen and florists.

Many of these plants are clean and free from insect pests or plant diseases while others are badly infested and must be refused entry. Each spring when the Cape jasmines are blooming in the South quantities of these cut flowers are sent to California, and with them we nearly always find on their foliage the larva of the Citrus White Fly, Dialeurodes citri, an insect which is a very serious pest of the citrus industry of the Southern states, and which, if it became established in the groves of California would place an additional burden on the growers.

Few people realize the danger when they ask that plants or flowers be sent them from other states, and too often they are prone to denounce the quarantine officers and the department of agriculture in general if their packages are found objectionable and confiscated by the quarantine officers.

Gill
One-piece Piston Rings
stop that motor knock

because: through thousands of miles of service, they retain their tension and form a snug, ***oil-proof*** contact with the cylinder walls. Oil does not work past Gill Piston Rings or through their leakless joint into the firing chamber. Spark plugs stay clean. Valves do not become carbonized. The walls of the firing chamber do not become heavily coated with carbon. And thus the common causes of motor knock are eliminated.

Identify the Gill One-piece Piston Ring by the joint, but do not measure its merit by the joint *alone*.

Gill Service is nation wide. There are more than 2,500 stocks of Gill Piston Rings in the country. Some one of these dealers is located near you to supply you with whatever size you may want and the number you want *when* you want them. If your garage or repairman or accessory dealer doesn't happen to carry Gill One-piece Piston Rings tell him to get them from his jobber or from the nearest of our 39 Branch Offices.

Soil Moisture Investigations

By Ernest Braunton

THE agricultural extension service of Los Angeles County has had Prof. J. W. Nelson making a series of soil investigations and demonstrations in various parts of the county, eight in number. Aside from numerous soil borings made in each district, Prof. Nelson charms his hearers with his practical talks and leaves his audiences with a far better knowledge of their soil possessions than they previously had. It is no "half Nelson hold" that he gains from all who are fortunate enough to hear him whom Farm Adviser Hodgson introduces as "the man of all men who knows California soils." Here are a few of the points he makes:

"The one thing every farmer should know is in what soil environment his plants will do best. When that is determined see how near to this ideal you can come in your care and culture. Up in the big valleys we have age-old soils that lie in well defined layers. Down here, especially in foothill districts, we have the widest range of soils in their adaptation of any soils in the world; youthful soils. Plants, like animals, need balanced rations. Try and meet the required maximum conditions. Even though the water supply as a whole is short in the south end of the state, there is still a slight over-use of water.

"Nitrogen and soil moisture are the two chief factors in citrus culture. Chlorosis is indicative of plant indigestion. The irrigator's greatest friend is a soil auger; everybody should have one with a six foot shank or rod. If I were to start a young orchard I should bore and chart the entire tract, determine every gravel pocket or hardpan deposit, to a depth of six feet. Where a hard stratum exists bore down to within four inches of the bottom and give it a charge of 20 per cent dynamite. Then set out the trees. For the first three or four years I would plow deep and close to the trees. Never mind about cutting roots in the first years, while the trees are making only wood growth. It is at this stage we must encourage and develop a deep rooting system. Determine to have a deep root zone.

"In after years plow more lightly. The top foot or foot and a half is very sensitive to climatic conditions; get the feeding roots lower. So practice irrigation that you wet the entire orchard area and have that wetting uniform. If you leave a dry spot between the rows or close up to the tree the roots these cease to function and the tree is in distress, for the roots are always balanced to meet the needs of the top. If during summer you leave two or three feet of a dry zone about each tree but about 75 per cent of the roots are functioning. When the first heavy rain comes 100 per cent commence to function and this stimulus produces a fall growth, often blossoms, and other attendant ills. Then, as you have had a 75 per cent tree all summer, you now have 100 per cent of busy roots. All know the frequent disastrous results. Irrigate close up to the tree at all times and in times of stress or distress the close up roots can most quickly respond to the call for help.

"How am I to know what my trees need? Fully $1,000,000 worth of commercial fertilizers are annually wasted in this end of the state on orchards where the soils are in such condition that the trees cannot take up the plant food. Physical condition is at fault. The water content is 75 per cent of the game. The amount of organic matter in the soil is of next importance, as without a sufficiency the plant food is not soluble. One pound of organic matter in the soil increases its water holding capacity seven or eight pounds. Don't irrigate deeper than the roots; water don't come up. It obeys the law of gravity; once down it stays down. We used to think some of it would come up through capillary attraction. We know now it does not.

"Sixty per cent of the mottle leaf in citrus orchards is due to too much water; especially true where drainage is not good. Recent experiments in Tulare County have proven we may subsoil close to the tree, at any time of the year, to the depth of 18 or more inches, without harm to tree or crop. We are not advising you to do this but all our experiments have resulted in no harm and no signals of distress. But irrigate immediately after so cut roots may quickly resume normal functions. If you are doubtful, go down one side of a row, ripping down deep, then irrigate and watch for results. If no distress is shown, go down the other side. From now until the cold weather, after the crop is off, is the season when trees store food and vigor for next season's crop. See that they are well fed."

Aid to Motor Truck Owners

It will surprise many truck owners to know that there are many agencies where cooperation, records of previous enterprises and statistics on motor truck operation may be obtained to assist them in making more money with their motor trucks.

The department of agriculture at Washington, the National Automobile Chamber of Commerce, 366 Madison Avenue, New York City, the research departments of the big tire companies, and the traffic engineers of most of the larger truck concerns, all have information and data which will be of benefit to those motor truck owners who are interested in forming intercity lines for the haulage of more goods, both freight and express, and any rural motor express work.

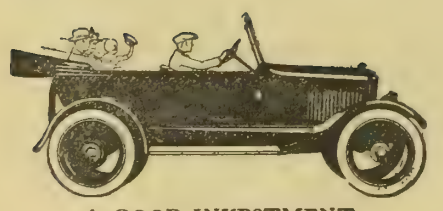
In addition to the above available sources of information for the truck owner, there are the local chambers of commerce in almost every city of 25,000 or more in the United States, as well as the more recently formed local transportation associations in many of the larger cities. Bulletins of various kinds, booklets unnumbered, and cost figures without end, may be obtained from these sources, which will enable a man or firm to form motor truck lines which will be profitable and a source of great convenience to the shippers.

A recent bulletin issued by the National Automobile Chamber of Commerce is entitled "Motor Transport Cuts Time and Cost of Shipping in New England"; another, "Good Roads and Motor Transportation"; still another, "Motor Trucks Save 45 Hours Per Shipment for Bay State Manufacturers"; Bulletin 931 of the United States department of agriculture is entitled "Corn Belt Farmers' Experience With Motor Trucks." Ontario department of agriculture, Canada, has issued Bulletin 277, entitled "Motor Transportation in Rural Ontario." All of these booklets and many others may be obtained from the above sources, and will be most profitable to those who are interested in motor trucking.

Certainly one of the greatest jobs in food and factory production is transportation, and the world needs just as much food as it ever did, and much of that food to be marketed properly must be transported quickly. Motor trucks can do this job better than any other form of transportation. Business is coming back slowly but surely, and an increasing number of motor truck routes are a necessity if we must continue economy in haulage.

Amazing Demand

Production doubled again! *America's low cost car* is finding thousands of buyers who had no idea such a car could be had for so little! Not only amazingly low first cost—but almost unbelievably low *after cost!*



A GOOD INVESTMENT

Overland Now $695

The ideal car for every family who has something to do! You can use it anywhere and never mind the cost. The solid frame on *Triplex Springs* assures long life with comfort and low upkeep. The baked enamel finish looks bright after long use! *Gasoline economy averages 25 miles per gallon!* Exceptional tire economy! Ride in comfort wherever you go!

Ask About Extremely Easy Payments

ADVANCE IN BULK HANDLING OF GRAIN

As to the advancement made in bulk handling of grain and number of elevators under control of the farm bureau marketing association we have asked Secretary Heileman of the Farm Bureau Federation and he writes:

"The California Farm Bureau Elevator Corporation is building a plant at Patterson and another at Montpelier and is arranging for a third plant to be immediately constructed at San Lucas. The corporation has taken over the terminal elevator at Oakland under a five year lease with an option attached.

"The above covers the activity of the corporation, which has carried on its work for the season since March of this year. We expect, of course, to continue the construction work indefinitely, or so long as the farmers desire to adopt bulk grain methods.

"Several large concerns in the state are handling bulk grain for their own use and there are a few elevators scattered about over the state, though handling grain through elevators is not as yet an established practice in the state."

A GREAT PRODUCTION

The chamber of commerce of Los Angeles County, through its agricultural department in charge of Dr. Clements, has made an authentic compilation of 1920 crops in which we note:

"In a general estimate it may be figured that 1920 showed an increase of approximately five per cent in acreage under cultivaiton. By way of comparison attention may be called to the fact that although a large percentage of the population of the east thinks of California as the "golden state" and knows that it leads all states in production of gold from its mines, the total gold produced in the entire state is approximately only one-third of the value of the soil products of Los Angeles County alone. The actual value of California's gold last year was $17,398,200, but there is one crop in Los Angeles County that exceeds it. This is oranges, which totaled in value $18,965,800 last year."

Here are a few of the productions of that one county: Barley hay, 35,000 acres, 61,250 tons, $1,531,250. Beans, 30,000 acres, 360,000 bushels, $1,188,000. Potatoes, 13,000 acres, 1,430,000 bushels, $3,575,000. Alfalfa, 15,000 acres, 97,500 tons, $2,340,000. Sugar beets, 15,000 acres, 100,000 tons, $1,163,000. Total, with other general field crops not mentioned above, 155,300 acres, valued at $11,665,250. Truck crops, 31,050 acres of a total value of $10,061,096. Three of these crops came above the million dollar mark. They were tomatoes, strawberries and melons. The big wealth of the county, however, is piled up in the fruits and nuts. Of apricots there were 5,073 acres, 11,123 tons, of a value of $945,455. Peaches, 6,066 acres, produced fruit of a value of $2,857,980. The county grew pears valued at $257,450; prunes, $55,000; plums, $56,000; figs, $15,000; grapefruit, $306,000; almonds, $362,760; avocados, $100,000. Other larger producers were: Lemons, 10,679 acres, 1,785,720 boxes, $2,851,303. Oranges, 37,618 acres, 5,418,800 boxes, $18,965,800. Walnuts, 24,124 acres, 8,200,000 pounds, $2,542,000. Olives, 2,776 acres, 7,600 tons, $1,064,140. Grapes, 3,417 acres, 24,160 tons, $1,812,000. Total valuation of fruits, $32,031,658. Grand total of all crops in the county, $53,758,004.

These figures are nearly $10,000,000 short of those given by the U. S. census in its preliminary statement issued early in April for the year 1919. Figures for 1920, however, are explained by the general trend toward lower prices and are no reflection on the soil conditions or on the energy of the farmer.

RED SPIDER DEMANDS ATTENTION

The pest control service of the California department of agriculture, based upon a report from Field Entomologist Theo. D. Urbans, says that the hot, dry weather of the past two weeks has caused the rapid development of the red spider in fields and orchards. The crops most severely affected are almonds, prunes, peaches, hops, strawberries and others, varying according to the location and cultural conditions. The amount of irrigation water available has an important bearing on the control of the red spider.

Orchards which have been persistently dusted with dry sulphur are considerably less affected than untreated areas. Where this pest is now so abundant that the plants are suffering, dusting with dry sulphur will probably not be sufficiently effective to bring the pest under control and the liquid spraying will be necessary. It must be remembered that there is considerable danger of sulphur burning to the foliage on our hottest days even where the extreme heat does not come until two or three days after the spraying has been done. For this reason the minimum strengths of the different sulphur combinations which will kill the red spiders are recommended for summer spraying.

The lime-sulphur solutions should not be used stronger than 1½ gallons of liquid lime-sulphur to 100 gallons of water or 5 pounds dry lime-sulphur to 100 gallons of water. A better combination would be to use 1 per cent lime-sulphur solution with the addition of about 6 pounds of any of the wettable sulphurs to 100 gallons of water. About 3 pounds of paste spreader will increase the efficiency of the spray, which must be directed so as to strike the under side of the leaves.

From present indications we may expect severe red spider injury before the close of the season unless proper control measures are applied.

CROP ESTIMATING AND STANDARDIZATION

The California state department of agriculture and the federal bureau of markets have entered into an agreement for conducting on a cooperative basis standardization and crop estimating work in California. The purpose of the standardization work is to bring about an improvement in the use of existing standards and to establish additional standards for fruits and vegetables, as well as to coordinate the shipping point inspection established in California with the food products inspection now being conducted by the federal bureau in central markets.

The object of the cooperative work relating to crop estimating will be to coordinate the state and federal services and to develop intensively the crop and livestock service for the special benefit of the people of California and the general benefit of all interested in the agricultural industry.

An organization consisting of eight specialists and technical men is being formed to conduct the work. While the headquarters for this work will be with the California department of agriculture at Sacramento, branch offices will be opened and maintained in various parts of the state.

PNEUMATIC TIRES SAVE HIGHWAYS

Many roads not originally intended to carry heavy traffic were seriously damaged during the period of the war by the impact of heavy motor trucks. The natural result of this was to warn highway engineers of the importance of planning all future roads with reference to the kind of traffic that is likely to use them. The engineers responded immediately by building thicker roads and roads of more durable material; but in the absence of definite knowledge of the probable strength of the impact they have not known exactly how thick or how strong the roads must be made.

Recent tests of the impact of motor trucks made by the bureau of public roads develop the facts that when a solid tired truck strikes a one inch obstruction the impact may be as high as seven times the load, an average being about four times.

The tests show, however, that the impact depends largely on the kind and condition of the tire. Pneumatic tires cause the least damage to the road surface, the cushion of air reducing the impact so that it is seldom greater than 1¼ times the static load on the wheels. Although the impact increases with the speed of the truck, and it is therefore highly desirable to limit speed by strict regulation, the use of pneumatic tires would make higher speed permissible.

The tests of the bureau of public roads have pointed the way to more scientific designing of roads for motor truck traffic, and there is every assurance that engineers will now be able to build roads with practical certainty that they will withstand the blows of heavy vehicles.

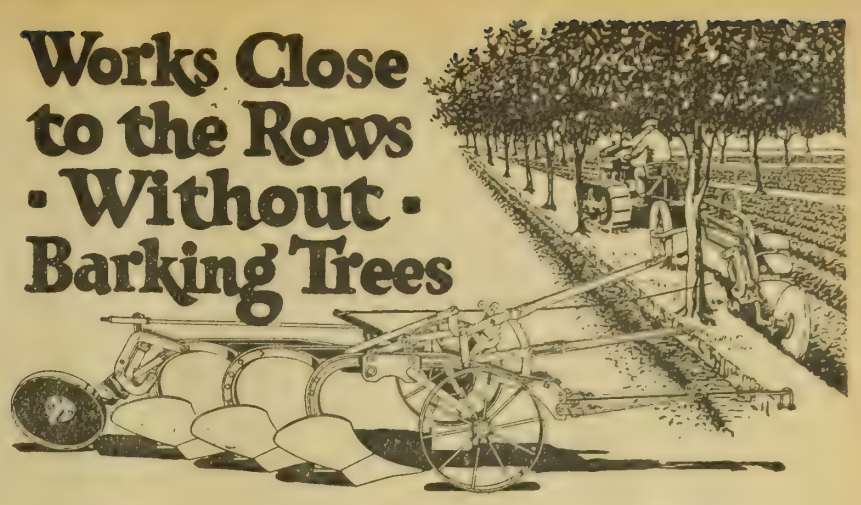
Further reassurance in this respect lies in the information that manufacturers are not building as many trucks exceeding five tons capacity as formerly. The number of industries in which very large trucks can be kept continuously working is extremely limited, so that the likelihood of forthcoming motor truck damage to public highways is considerably reduced.

IF THEY MIGHT BE FOUND!

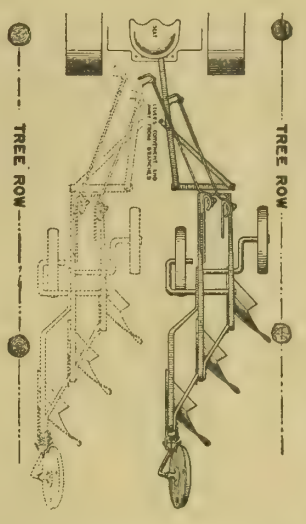
Lecturer (describing the charm of foreign travel)—There are many spectacles that one never forgets.

Old Lady (in the audience, excitedly)—Oh, do tell me where I can get a pair; I'm always forgetting mine.

Works Close to the Rows · Without · Barking Trees



THE John Deere No. 8 Orchard Tractor Plow, built especially to meet the requirements of Western fruit growers, has special advantages for doing good work up close to the row without harming trees or branches.



A Feature Every User Appreciates

With the plow set over to throw either to or from the row, the levers can be quickly angled so that they are within easy reach from the tractor seat, out of the way of limbs and free of the wheels when the tractor is turning short.

Convenient Supplies

Large stocks of John Deere implements and repairs for Western territories are kept by John Deere branch houses at San Francisco, Cal.; Portland, Ore.; Seattle and Spokane, Wash., and Boise, Idaho. There is a John Deere dealer in practically every farming community.

Reversible Hitch permits setting the plow to either side for close work in throwing either to or from the row. Note the illustration at the left.

Levers can be angled in when the plow is set to either side—they are always within easy reach from the tractor, out of the way of branches and free of the tractor wheels, when turning short.

Levers set low when the plow is at work.

Doesn't scar trees—note the wheel base design that permits close work without scarring trees—land wheel set inside line of third beam; furrow wheel set inside line of inner moldboard wing.

Simple, positive power lift—great range of adjustment for deep or shallow plowing; unusual clearance; bottoms that insure good scouring and pulverizing, and strength throughout to stand the strains.

Just the size for small tractors — three ten-inch bottoms—pulls light. Can be reduced to two bottoms by removing one beam, bottom and brace, and using a short connecting rod furnished as an extra.

Write today for a free booklet describing the No. 8 fully. Address John Deere, Moline, Illinois, and ask for Booklet OP-86.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Beans Dying

What is the trouble with my beans, leaves of which I am sending?—Subscriber.

The leaves sent were yellow and apparently taken from a dying plant. However, they were submitted to an expert and he writes: "I have examined the bean leaves and have absolutely nothing to offer with the exception that it appears to me that the trouble is likely to be found at the roots. It might be a case of rhizoctonia or fusarium or even nematode. The small spots on the leaves I do not think are the main cause of the trouble."

In sending leaves of diseased plants more particulars must be given and a most careful inspection of the plant, the soil and the surroundings should be made and description given to us for submission to experts. The plant may be dying at the root as result of fungous or other trouble, and the leaves may show that they are out of condition and yet give no indication of the cause of the death of the plant.

Thoroughbreds

Can you please explain the difference between a thoroughbred and pure bred? I always thought a thoroughbred was a running horse like Man o' War and a pure bred was any other animal, viz., pig, cow, dog, etc. My friend, however, claims that thoroughbred and pure bred mean the same. Am I right?—Subscriber, Long Beach.

Like many other English words Thoroughbred has been fearfully misused. We would call the attention of our contending subscribers to "Purebred—Thoroughbred" on page 456 of our issue of April 2, 1921, which gave over a column to discussion of use of the terms. Specifically the noun Thoroughbred refers to "The English Thoroughbred, a race or breed of horses kept chiefly for racing, with an old recorded ancestry of unknown origin probably Oriental or from crosses of barb, Arabian and Turkish blood. The American Thoroughbred is from it and practically identical." Admiration for this magnificent breed has been such that the term Thoroughbred has been applied to other animals and even to human beings. A man of finer parts, full of mettle and enthusiasm, is often referred to as a Thoroughbred, but the application of the word indiscriminately to dogs, hogs and even gold fish is entirely incorrect no matter how pure the breed.

Garbanzos for Pigeons

I have just noticed the query about Garbanzos as a feed for pigeons, and as you "pass the buck" here goes. The analysis is: Protein 19.25, fat 6.25, fiber 2.34, carbohydrates 60.80, water 8.25, ash 3.11. From experience I can say that these make an excellent feed for pigeons, and when they can be found at a reasonable price good results will be had in feeding them up to 50 per cent of the ration.—Wilbur T. Helm, El Rio.

KIRKMAN NURSERIES

Reliable Trees and Vines

For Commercial Orchard and Vineyard Planting

Deliveries made direct from nearest propagating plant. To serve the orchard and vineyard planters of California to the fullest satisfaction and efficiency is our aim. We are gratified to have entrusted to us the future of small orchards as well as the large projects. One acre of Kirkman Trees will draw to us greater future plantings. One California orchard has taken two hundred and fifty thousand of our trees. Another four hundred thousand trees. Another six hundred thousand trees and vines together. They have reservations with us for their next season's plantings. The Ex-Governor of Coahuila, Mexico, named his immense project "El Fresno" in honor of our deliveries of nursery stock. We plan to serve every customer so satisfactorily that his future profits will be assured. Correspondence solicited.

Kirkman Nurseries

Fresno, California

Member of Nurserymen's Bud Selection Association of California

Federal Farm Loan

I would like to know under what conditions money could be borrowed from the federal reserve bank. I have in view a place or farm in Shasta County, California, which I think I could buy and be given the privilege of giving a first mortgage for an amount equal to a first payment, which would not exceed 50 per cent of the valuation of the place. I read an account of a man who bought a farm in this way, borrowing the money from the federal reserve bank and giving them a first mortgage for the amount borrowed, the man from whom the place was bought taking a second mortgage. — Subscriber, Las Vegas, Nevada.

Presumably our subscriber wishes to know as to the federal farm loan bank as the federal reserve bank is unable to make long time loans. The best information about the operation of the farm loan bank may be had by writing Federal Farm Loan Bank, Berkeley, California, for printed matter describing operation of the system and giving information as to the nearest federal farm loan association. These associations have been formed in many of the counties of California and afford material aid in securing the loan. From that association the application blank may be had and this filled out with description of the property, location and other matters, will first be passed upon by the appraising committee of your local association. If this committee gives favorable decision the matter is referred to the bank and the official appraiser will as soon as possible pass upon the loan. The various steps required in securing these loans necessarily consume a lengthy period before the matter can be closed. If a buyer who thoroughly understands the farming game can find an owner who would sell under the plan outlined by our inquirer it is possible he could make good and pay for his farm, but unless one is a born and bred farmer he would find many difficulties, that is, unless his idea in starting without any payments is to have abundant working capital. The average value of farms in California is reported in the 1920 census at $26,122. This means farms and buildings. On top of that comes equipment and livestock. Therefore, it may be seen that farming in California requires a sizable investment.

Panic Grass

Please tell me the name of the grass inclosed.—Subscriber, Wasco.

This is a species of panicum or panic grass, of the millet tribe. Several species occur in all parts of the state. Some are annuals; some perennials. Only the roots could determine this. Some have simple stems; some branch. From the flowering tops sent we cannot say more than it is a panicum, for all species are variable, some so much so as to puzzle the best botanists. But we trust this answer is sufficient. If not, send part of entire plant, including roots.

Canadian Thistle

Note in today's Cultivator an item on the Canadian thistle. This is not as hard to get rid of as some think. One has only to plow about four inches and harrow and in six weeks repeat, and that will be the last of the thistle. Another way is to spud them out below the crown when they are one foot high before the ball or seed forms. A spud is a knife like the putty knife on the end of a hoe handle. This is slow but sure.—Subscriber, Redlands.

SAN FERNANDO VALLEY FAIR ENDORSED

The San Fernando Valley Fair to be held September 13-18 has been endorsed by the Los Angeles chamber of commerce as the county fair for Los Angeles. The San Fernando Valley communities have united in organizing a big fair, offering cash awards of $22,000. There will be a horse show every evening and a working tractor demonstration every afternoon. The official poultry show of the A. P. A. for California is expected to bring out a big exhibit.

The State Fair

By Chas. W. Paine

SINCE 1854 when the first state fair was held California's annual exposition has grown steadily through the years until today it has attained proportions that entitle it to rank among the larger fairs of the country. While the growth in the past few years has been marked there is little doubt but that this year's exposition and those of succeeding years will see continued development.

Some idea of the growth of the institution can readily be gained when attention is called to the fact that the first state fair was held at San Francisco with the meager appropriation from the state of $5,000. The total amount of premiums offered at that exposition was only $4,660.

In 1855 the fair was held in Sacramento, in 1856 in San Jose, 1857 in Stockton, 1858 in Marysville, 1859 in Sacramento, where it has been held thereafter each year with the exception of the year 1915 when no state fair was held because of the Panama Pacific International Exposition in San Francisco.

It is interesting to note that there were no races held in connection with the state fair until 1873, when the premiums amounted to $8,925, and the race purses totaled $14,200. Up to 1916 the amount of money offered for the purses exceeded that offered for premiums. During the incumbency of John M. Perry of Stockton as president of the state agricultural society the premiums offered were $41,536 and the purses totaled $16,500.

In 1920 the offering for premiums in livestock and other products amounted to $52,976. This amount, in addition to many more thousands of dollars offered as premiums in other departments, brought the total figure close to the $100,000 mark, which this year will be greatly increased.

These great strides have made the state fair the one big annual event by which to measure the development of the resources of California and the result has been that these annual expositions are among the most influential of the agencies employed toward practical education and advancement in the state.

The service the California state fair has rendered to the agricultural and livestock advancement can in no way be estimated. Year after year it has been the means for establishing standards, practices and types. Year after year it has offered inspiration and encouragement to thousands.

The fair is going to render a greater service to the farmers and the people generally of the state this year than during any previous period in its history. Farmers who attend this year's exposition will obtain more real, practical, solid ideas about farming, stock raising, marketing and similar problems which are vital, than can be gathered from any number of books or schools. And, what is more important, they will be ideas and suggestions which are up to the minute, designed to meet present day problems with present day methods.

For it must be remembered that the state fair is first of all an educational institution. It has back of it a serious purpose, that of providing object lessons in farm cultivation, farm home culture and in other lines of endeavor. While it presents many features of the lighter sort, amusing, entertaining, and diverting, the whole idea centers in the need for more definite knowledge of the growth of agricultural and mechanical science.

The tradition of the state fair for offering extremely liberal prizes for competitions between livestock, agricultural and vocational exhibitors is to be fully upheld this year and it is certain these important departments will more than live up to their mark of past years and record again the great progress California is constantly making in these fields of endeavor.

California is an agricultural and stock raising state in the strictest sense of the word. These two industries represent a great part of our productive wealth, therefore it is but natural that there should be the greatest competition among exhibitors in these departments when the gates of the state fair open in September.

The exposition this fall is to be so replete with exhibits and displays that it is almost impossible to ennumerate all. Prominent among these will be the "Power of the Farm" section in an eight acre space covered with the largest tents ever made. This exhibit will house every kind and make of power machines used on the farm. Every bolt and working part of every machine, from the power churn to the tractor, will be displayed and experts will be in attendance to point out the many advantages offered by these labor saving devices. The latest conveniences in household furnishings also will be shown and should prove of interest to the women fair visitors.

The vocational exhibits, contributed by the children of California's schools, will be the finest that have ever been shown at the fair. With the incentive of attractive prizes and urged by the educational advantages of such training, the schools of the state have advanced at a marvelous rate during the past few years and have taken a greater interest in placing competitive exhibits at the fair.

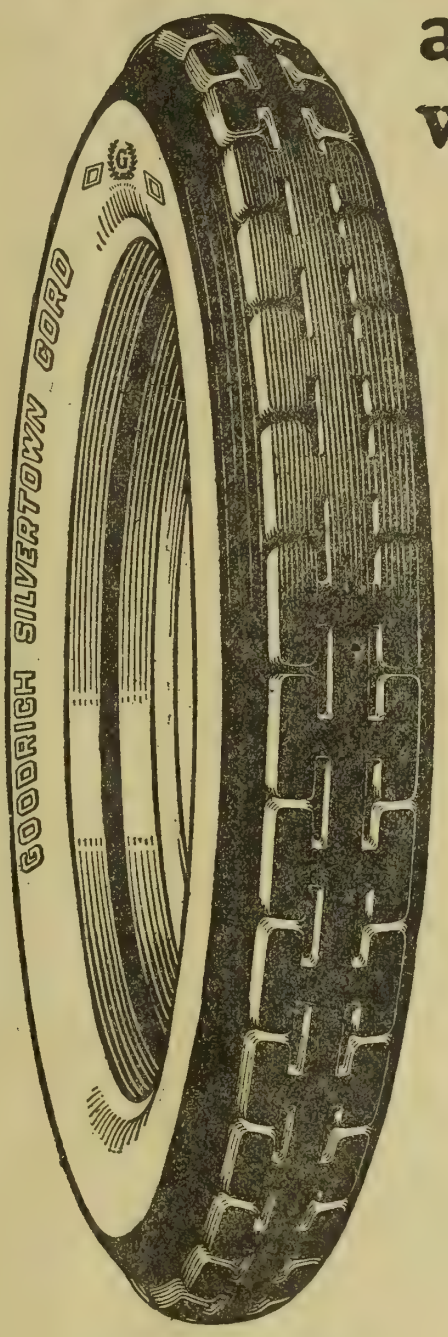
Every comfort and convenience will be installed for the women and babies. Nurses and physicians, playgrounds and clinics will care for the comfort and safety of mother and little ones. Nothing will be overlooked to make these features par excellence. Indian exhibits, music, the art gallery and the annual baby contest also will add to the attractiveness of this department.

Some berries and apples on Sonoma County ranches are reported burned by the recent hot weather.

INCENSE CEDAR

A tree common to all parts of California is the incense cedar (Libocedrus decurrens Torrey) of which the cut in California alone amounted to 16,587,000 board feet in 1916. The wood is chiefly valuable for its lasting qualities, and it is used for telegraph poles, ties, flume timbers, etc. Recently it has come more and more into use for pencil slats, as the supply of southern red cedar becomes exhausted. The commercial range of incense cedar is confined to the west slope of the Sierra Nevada and the mountains of northern California and southern Oregon, although the tree occurs throughout the mountains of the Pacific Coast from central Oregon to northern Mexico. It is found only in mixture with other species, chiefly yellow pine, sugar pine, Douglas fir and white fir, averaging in general about eight per cent of the stand.

Goodrich Tire Price Reduction applies to all sizes—without reservation



The anti-skid safety tread Silvertown Cord

The name of Goodrich on a tire means just one thing—quality. And that quality is always the highest that can be produced.

Each tire is specially designed for the service it must deliver. Goodrich Fabrics, in the popular sizes, have established themselves as unusual values from the standpoint of real economy. Silvertown Cords in their class have always held first place in the esteem of motorists, not only because of their symmetrical perfection of finish, but furthermore, by reason of their long life, complete dependability and satisfactory performance.

Your dealer will supply you at these fair prices:

SILVERTOWN CORDS

SIZE	Anti-Skid Safety Tread	TUBES
30x3½	$24.50	$2.55
32x3½	32.90	2.90
32x4	41.85	3.55
33x4	43.10	3.70
32x4½	47.30	4.50
33x4½	48.40	4.65
34x4½	49.65	4.75
33x5	58.90	5.55
35x5	61.90	5.80

FABRIC TIRES

Smooth	30x3	$12.00
Safety	30x3	13.45
Safety	30x3½	16.00

Safety	32x3½	$20.25
Safety	32x4	26.90
Safety	33x4	28.30

20% Lower Prices

The Goodrich price reduction which took effect May 2nd was without reservation. It included Silvertowns together with Goodrich Fabric tires and Goodrich Red and Gray inner tubes.

THE B. F. GOODRICH RUBBER COMPANY

THE OPTIMIST

For light and love and laughter,
For flowers and fun and play,
For dawn of day and sunset—
Father, our thanks this day.

For every thought that's noble,
For every aim that's right,
For strength and courage given
To aid us in the fight.

For friendship's priceless jewel,
For childhood's sunny smile,
For all the kindness spoken
To warm our hearts awhile.

For sorrows that have opened
Our eyes to higher things:
For everything that soothes us
And everything that sings.

For those we long have cherished,
For those we loved and lost,
Who wait somewhere to greet us
When we the Stream have crossed.

For sleep, when day is ended,
For dreams and high desires:
For all the soul's calm yearnings
And all the heart's high fires.

But above all the blessings
That bloom along the way,
For work and power to do it,
Father, our thanks this day.
—Leigh Mitchell Hodges.

HOME CANNING OF FRUITS

(Continued from Page 77.)

Soft fruits are brought to boiling in syrup or with sugar as described above and packed hot, enough of the syrup being added to cover the fruit.

Sealing Cans

If Sanitary cans are used they should be sealed immediately after filling the can with hot fruit.

If glass top jars are used place scalded rubbers and caps in place and place clamp on top. Do not pull down the side clamp. The lids of other jars should be screwed on loosely. Full directions for the use of these machines accompany them.

Sterilizing

The old wash boiler may be used as a sterilizer. Just place in it a false bottom made of wooden slats and set the jars on this rack. Wire racks are available at moderate cost.

The water in the boiler should come about half way up the sides of the jars or cans and should be about the same temperature as the jars in order to avoid breaking the glass.

Cover the boiler with a tight fitting lid. A large piece of cloth placed between the lid and boiler is sometimes desirable.

Heat to boiling and boil for the length of time given in the last paragraph, counting time after the water boils. Jars require longer than cans because they heat more slowly. The jars of fruit are removed as soon as the sterilization is completed and are sealed at once. If stood upside down leaks can be detected.

Cooling

Cans should be placed in cold water for about ten minutes after sterilization in order to check overcooking.

Botulism

Much worry in regard to the safety of home canned fruits has been caused by newspaper reports of cases of poisoning. People have been killed by home canned fruit but in every case the fruit was put up in the old fashioned manner by simply boiling it, packing it hot without additional sterilization in the jar. That is the vitally important step in canning.

Fruits canned and sterilized as directed in this article are safe.

Time Table for Canning Fruits

Time of sterilization at 212 degrees Fahrenheit:

Apples in cans 10 minutes, in jars 15 minutes (blanch 1½ minutes before canning).

Apricots in cans 10-12 minutes, in jars 20 minutes.

Blackberries in cans 8 minutes, in jars 15 minutes.

Cherries in cans 18 minutes, in jars 25 minutes.

Currants in cans 10 minutes, in jars 15 minutes (use only enameled cans or jars).

Figs in cans, 40 minutes, in jars 40 minutes (better preserved).

Grapes in cans 10 minutes, in jars 15 minutes (Muscat variety best).

Loganberries in cans 8 minutes, in jars 15 minutes (enameled cans or jars).

Peaches (free) in cans 15-18 minutes, in jars 25 minutes.

Peaches (cling) in cans 20-25 minutes, in jars 30-35 minutes.

Pears in cans 18-22 minutes, in jars 30 minutes.

Plums in cans 8-14 minutes, in jars 20 minutes (enameled cans or jars best).

Raspberries in cans 8 minutes, in jars 15 minutes (enameled cans or jars only).

Strawberries in cans 8 minutes, in jars 15 minutes (better preserved or as jams).

Caution: Count time after water begins to boil.

HINTS FROM HOUSEKEEPERS

Mixed and Fig Pickles, Breakfast Buns

In the Cultivator of July 2 there was a request for a recipe for mixed pickles. Am sending one which I have used for years and which we think excellent.

Mixed Pickles.—Three pints green beans, cooked; 1 pint onions, scalded in hot salt water and then chopped fine; 3 pints large cucumbers, chopped; 1 pint small cucumbers, whole; 2 pints green tomatoes, chopped; 3 bell peppers, chopped; 3 pints vinegar; 3 cups sugar; ¾ cup flour; 2 teaspoons celery seed; 2 tablespoons mustard seed; 1 tablespoon tumeric powder. Chop tomatoes, cucumbers and bell peppers and let stand over night in weak salt water, drain, mix all well, put on stove when hot. Have flour and tumeric powder mixed with water, pour over, stir gently. Cook ten minutes, then can.

Fig Pickles.—Also here is a recipe for fig pickles which is very good: To one pound of figs, three-fourths pound of sugar. Drop figs in the boiling syrup and let remain until you can penetrate them with a straw, then remove and place in jars in layers, between which sprinkle a few cloves and some cinnamon, then cover with syrup. For three mornings pour syrup off, bring to a boil; on the third morning add one cup of vinegar to each three cups of syrup, cover fruit and seal.

Here is a good recipe for hot breakfast buns: Two cups yeast sponge, 1 cup sugar, 1 cup lard, 1 cup warm water. Mix as for bread, let stand until bedtime, then roll one inch thick and cut as biscuits, let raise until morning and bake. — Mrs. Mary Hughes, Santa Ana.

Fruit as a Medicine

People with serious stomach trouble who can not eat any ripe or canned fruit can eat all dried fruits. Cook rolled oats, corn meal or cream of wheat with equal parts of any kind of dried fruits, especially seedless raisins.—O. H. Mack, Reno, Nevada.

HOUSEHOLD QUERIES

Olive Oil Pickles

Can you send me a recipe for olive oil pickles? I think I saw one in the household department a year ago.—Subscriber, Glendale.

These are exceptionally fine: Two dozen medium sized cucumbers sliced, 1 pint vinegar, ½ cup olive oil, ¼ cup salt, ¼ cup sugar, 2 ounces mustard seed, 1 tablespoon celery seed. Mix, let stand 2 hours, then can cold.

Oil Cucumber Pickles

Would the household please print a recipe for oil cucumber pickles (not olive).—Subscriber, Porterville.

Two dozen medium sized cucumbers sliced, 1 pint vinegar, ½ cup salad oil, ¼ cup salt, ¼ cup sugar, 2 ounces mustard seed, 1 tablespoon celery seed. Mix and let stand 2 hours, then can cold. These are exceptionally fine and very simply prepared.

Canning String Beans

Will string beans keep if put up in

The Cultivator Patterns

3672-3673. Ladies' Costume.—Waist 3672 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3673 cut in 7 sizes: 26, 28, 30, 32, 34, 36 and 38 inches waist measure. A medium size requires 3¼ yards of 40 inch material for the skirt and 3 yards of 36 inch material for the waist. The width of the skirt at the foot is about 2⅞ yards. TWO separate patterns, 10 cents FOR EACH pattern.

3682. Girl's Dress.—Cut in 4 sizes: 4, 6, 8 and 10 years. A 6 year size requires 3¼ yards of 24 inch material. Price 10 cents.

3145. A Simple Apron. Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. A Medium size will require 4 yards of 36 inch material. Price 10 cents.

3676. Boy's Shirt.—Cut in 5 sizes: 6, 8, 10, 12 and 14 years. A 12 year size requires 3¾ yards of 27 inch material. Price 10 cents.

3668. Misses' Dress.—Cut in 3 sizes: 16, 18 and 20 years. A 20 year size will require 4¾ yards of 38 inch material. The width of skirt at the foot is about 1⅞ yards. Price 10 cents.

3660. Girl's Dress.—Cut in 4 sizes: 6, 8, 10 and 12 years. Size 10 requires 3⅝ yards of 38 inch material. Price 10 cents.

3656. Ladies' House Dress.—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 5 yards of 36 inch material. The width of the skirt at the foot is 2 yards. Price 10 cents.

3674. A Comfortable Corset Substitute.—Cut in 4 sizes: Small, 34-36; Medium, 38-40; Large, 42-44 and Extra Large, 46-48 inches bust measure. A Medium size requires 1½ yards of 32 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT
California Cultivator
Los Angeles

jars? Please tell me how to obtain best results in putting them up.—Subscriber, McFarland.

String beans will keep if put up in jars with lemon juice or vinegar added to brine. If you have a steam pressure cooker or canner it will not be necessary to add the acid. Here are directions as given by W. V. Cruess of the state university in his book, "Home and Farm Food Preservation." Note the article on this page by Mr. Cruess on home canning of fruits. We will have another on canning vegetables next week or the week following.

Canning String or Wax Beans.—Use small tender pods only for best results. Grade into two sizes; the smaller will be more tender. String and break or cut in pieces as for table use. Large pods are better if cut in thin pieces lengthwise. Parboil or blanch in boiling water (3 minutes for small tender pods, 6 or more for tougher pods). This may conveniently be done by placing beans in cheesecloth bag in boiling water. Then chill by plunging in cold water. Remove immediately, take beans from sack and pack in jars. Add boiling hot brine made in proportion of 2 tablespoons salt to 8 tablespoons lemon juice or strong vinegar per gallon of water. Place caps and rubbers on jars loosely. Boil 2 hours in cooker as shown in article on canning fruits in this department. Remove jars and seal.

If pressure canner is used omit lemon juice or vinegar. Sterilize in cans 30 minutes under 10 pounds steam pressure 240 degrees Fahrenheit.

Pecan Pralines

Please can you tell me how pecan pralines are made?—G. S. H.

Two cups brown sugar, ¼ cup boiling water, cook 5 minutes, add 1 cup pecan meats and 2 tablespoons butter. Remove from stove, beat 1 minute, drop spoonfuls on buttered pan.

OUR READER CONTRIBUTORS

The Happy Family

I am a subscriber to your paper and we get lots of helpful hints from it. I am interested in child life. We have raised eight, so can speak from a true standpoint in behalf of the child. I am sending just a few thoughts on a happy home. It may reach some reader and be helpful in a small way.

* * *

I know a happy family that lives in the country. We'll say their name is Brown. They have two children, a boy and a girl, Jack aged 12 and Janet aged 10 years. Jack and Janet are good children and go to school and help with the chores around the home. Mr. and Mrs. Brown take great interest in their children and have won their love and confidence by being companions to them and joining them in the pleasures of child life. They always have music, play games, read and tell stories in turns. Sometimes they go to a show or have some of their friends in for an evening of fun. In this way they keep their children at home and a love for home in their minds.

"We must teach the children to learn how to manage and think for themselves," said Mr. Brown to his wife. "I know of no better way," Mrs. Brown answered, "than to give them something they can call their own, to let them care for and have the proceeds to start a little bank account. It will teach them to save and manage."

So they planned to give Jack two orange trees, he to take care of them, cultivate, prune, spray, fertilize, water, pick and find a market for his fruit. All this he could do himself, so the cost was small. Janet was given six White Rock hens, pure breds. A fine rooster went with them. She sold the eggs for hatching, thereby getting the top price for the eggs.

Jack and Janet are up early, helping with the duties of home. They now have a nice little bank account started and are happy and contented on the farm, have pure food for their thoughts and are not surrounded by the evil temptations of an idle brain.

I wish we could all plan some aim in life for our children to work up to. It would make better men and women and there would be better fathers and mothers and more happy homes.—Mrs. J. W. Dines, Rialto.

HOMEMADE CANDIES

Divinity

Boil together 3 cups sugar, 1 cup corn syrup and ½ cup water to crack stage (till it is snappy and brittle when dropped in cold water) or to 270 degrees Fahrenheit. Pour over beaten whites of three eggs and beat rapidly. As it thickens add 1 teaspoon vanilla and ½ cup chopped nuts, half cup chopped candied cherries.

Plum Pudding Candy

Two squares chocolate, 3 cups sugar, 1 cup sour cream, few grains cinnamon, 1 teaspoon vanilla, 1/3 cup glace cherries, 1/3 cup Sultana raisins, 1 cup walnut meats.

Put chocolate in saucepan and melt over hot water, add sugar and mix well, then add sour cream gradually, stirring it in carefully. Put saucepan on range, bring to boiling point and boil without stirring to 230 degrees Fahrenheit, or until it forms a very soft ball when tried in cold water. Pour out on slightly moistened marble slab or large platter and leave undisturbed until cool. Work with a broad spatula until candy gets stiff. Put in top of a double boiler set over boiling water until candy softens, stirring constantly, add cinnamon, vanilla, cherries cut in pieces, raisins and chopped walnut meats; mix well and pour into an oiled brick mold or deep pan. Let stand several days to ripen, remove from mold and cut in pieces. Serves 32.

A man may be crooked and yet be going straight to the devil.

AN EYE THAT SAW

"Early this morning Joe treed a plump little squirrel and I got a clean shot at it. When I got up to where the little beggar had fallen I found that it was still living. For some reason, I stopped and looked down at it for a minute. There was an almost human look in those eyes. It was reproach mingled with pain, and it cut me to the quick. I felt as though I had shot Joe and he was questioning why I, to whom he had done no harm, should be so cruel. As these thoughts went through my mind, the little creature reached out his paw and drew a large leaf toward him. I had shot to kill, but he seemed to have gained the victory. He seemed to say with his eyes: 'You poor specimen of a man, what do you understand?' He drew the leaf over his face and the little body quivered and was still. I was shut out from something. I was nothing but a killer and should not see. It was as if that little animal saw God, but I was not worthy. I took off my cap and there in the woods I made a vow that I should never again shoot one of God's creatures for pleasure. Joe seemed to understand, for he nosed my hand sympathetically. I dug a little grave and placed the squirrel in it. Then Joe and I wandered home again."—Dumb Animals.

HIS SMILE

He wasn't rich as dollars go,
He didn't have a pile of dough.
He didn't own a motor car,
He couldn't often travel far,
He couldn't dress in costly style—
He just possessed a kindly smile.

Knew how to work and how to play,
He had a happy sort of way,
And he respected women fair,
And dealt with men upon the square,
And people thought him much worth while
Because he had a kindly smile.
—Michigan Tradesman.

THEY ALWAYS DO

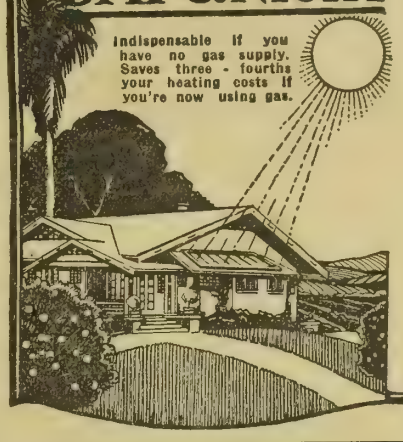
He worked by day,
He toiled by night,
He gave up play
And some delight.

Dry books he read,
New things to learn,
And forged ahead
Success to earn.

He plodded on
With faith and pluck,
And when he won,
Men called it luck.
—Detroit Free Press.

Let the SUN give you plenty of HOT WATER

DAY & NIGHT



SEEMS impossible, doesn't it: But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home—mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept. E.

Diamond Bar Duroc-Jersey
Show Herd For Sale

As we will not exhibit at the fairs this fall, we offer for sale the entire show herd which we are now fitting as we consider it will be better business, both for us and the breed, to have these animals win in our customers hands.

They are without doubt the best hogs Diamond Bar ever fitted and should win at any show in the country.

Our prices are very reasonable, as we want these animals to be in the show rings this fall.

Herd consists of Aged Sows, two Senior Yearling Sows, ten Junior Yearling Sows, ten Under Year Sows, three Under Year Boars and three futurity litters.

Act at once if you want one or more of these great individuals to win for you this fall.

Livestock News Notes

The H. G. Ranch at Santa Ynez writes: "We have just sold a pure bred Ayrshire bull calf to Charles Willoughby of Ventura, and we have been shipping many weanling Hampshire pigs to Northern California."

Senator Benj. F. Rush, veteran Shorthorn breeder of Suisun, has presented a junior Shorthorn heifer calf to the animal husbandry division of the University of California. The calf is a full sister to the heifer Mary Ann Rush presented to the college by Senator Rush last year and shown to the junior championship at the Pacific International.

Bullard Brothers, Woodland, report that their Rambouillets entered in the Del Rio, Texas, sheep sale topped the sale with an average of $80, and that they booked orders for additional heavy shipments.

At a meeting of the Pacific Coast Hereford Breeders Association held at Sacramento last week it was decided to hold a consignment sale of high class Herefords on Thursday, October 27, in connection with the California National Livestock Show at San Francisco.

One of the feature livestock events of the fall season will be the annual sale of Herefords from the J. H. Cazier and Sons herd of Wells, Nevada. The sale will be held at Sacramento, November 1 and will consist of 75 head of bred and open heifers and several herd bull prospects. The sale will naturally feature the service of the 1920 champion, Beau Blanchard 76th, on Harris Standard 2d heifers. The sale which will be managed by the California Breeders' Sales and Pedigree Company will be the second individual sale made from this herd. The first sale was held last fall and was the highest average Hereford sale held in the West.

J. W. Scudder, Escalon, reports the death of the well known Holstein bull, King Korndyke Pontiac, King Korndyke Pontiac, formerly at the head of the Jane Garden herd was the sire of the $12,000 King Korndyke Pontiac and therefore the grandsire of the $41,000 King Korndyke Pontiac Acme. He was sired by King of the Pontiacs and his dam, May Korndyke 2d was a daughter of Beauty Pietertje Prince.

The final figures for the new world record Holstein, Bella Pontiac, are 1,587.50 pounds of butter from 27,191 pounds of milk. The new champion completed her 365 days June 18 but as she was producing more at that time than at the beginning of the test she was carried on further, hence the increase noted over the figures announced in the Cultivator of July 2.

J. I. Cazier, Wells, Nevada, president of the Pacific Coast Hereford Cattle Breeders Association, states that his firm, the Nevada Hereford Ranch, will exhibit at the California state fair and also that it is certain that the Warm Creek Land and Livestock Company, Wells, will be represented at Sacramento with Shorthorns. Mr. Cazier reports the recent sale of a young bull, Sir Blanchard, a son of their champion Beau Blanchard 76th to R. T. Evans of Elko County.

One of the best sales of beef steers reported this summer was made when John A. Bunting of Mission San Jose sold two car loads for seven cents. The steers were Canadians a d have been running on grass for several months. Bunting will have out a strong Hereford show herd this fall.

It was announced last week that the Carleton College herd of Holsteins owned by the Carleton College Farm, Northfield, Minnesota, will be moved to this state in the near future and will be located on a large holding near Chowchilla. The herd in question is regarded as one of the high class herds of the Middle West and Manager F. F. Showers says that plans are under way which will at once place the herd in a forward position among Pacific Coast collections.

A. J. Harrell, a prominent stockman of Tehama County is establishing a herd of Hereford cattle on his ranch near Red Bluff and is expecting to receive a carload of registered heifers from Nebraska.

Alex. Wilson of the Italian Vineyard Company has sold 13 fine Berkshire gilts and a spring boar to T. H. Wright of Los Angeles for his ranch in Kern County. The gilts are bred to the great herd boars at the Guasti ranch and should make a fine foundation herd for Mr. Wright.

Carl P. Thompson of Clearwater, Oklahoma, member of the staff of the Oklahoma college of agriculture, will judge hogs at the Southern California Fair at Riverside. Mr. Thompson comes highly recommended by both the Berkshire and Duroc-Jersey Associations.

WOOL MARKETING PLANS DISCUSSED

Tentative wool grades formulated by the bureau of markets, together with the policies of the bureau and the American Farm Bureau Federation in regard to the regional and local county wool pools, were discussed at a conference recently held in Washington.

The farm bureau federation favors the plan of regional pools at points of large concentration, and is not convinced, it is said, of the practical value of the tentative wool grades. The conference resulted in a better understanding of the views of the farm bureau federation and of the bureau of markets regarding the points under discussion.

The meeting adjourned with the understanding that the bureau of markets would arrange for a later conference between representative wool growers, buyers, mills and organizations of farmers at a convenient date in order to promote a better understanding of the work of the bureau with respect to pooling, grading and marketing wool.

CALIFORNIA YEARLING AND TWO YEAR OLD JERSEY RECORDS BROKEN

Perfection of C. V.'s Pearl started test at 23 months of age and produced 8,375 pounds of milk yielding 525 pounds butter fat, entitling her to the honor of champion yearling Jersey in California.

King's Loretta D. of I. J. F. by producing 9,907 pounds of milk yielding 550 pounds of butter fat, exceeds the record for California Jerseys starting test as junior two year old. She began her record at two years and two months of age. Cows at her age are required to produce 256.9 pounds of butter fat to enter the register of merit. She more than doubled this. Her sire is King Mel Figgis 132899 and her dam is Financial Loretta D. of C. V. 304890. Bonnikson Brothers of Ferndale are the owners. The state class records for yearling, junior two and senior two year olds are now held by their cows.

NATIONAL SWINE SHOW

The recent session of the Illinois legislature appropriated $15,000 per year for two years to the National Swine Growers' Association, provided the National Swine Show is held in Illinois, $2,500 for managerial purposes and $12,500 for premiums. This makes it practically certain that the National Swine Show for 1921 will be held at Springfield.

IRIS ROOTS POISONOUS

Linnaeus was the first to record that irises are poisonous to cattle, but cases of such poisoning are rare. Some cases of human deaths are reported from eating the rhizomes of Iris versicolor, mistaking them for roots of sweet flag, Acorus Calamus. Several other species are considered poisonous. Last year there were noted in Canada three cases of death of calves, ranging from three to five months old, from eating iris roots lying on the ground.

State Register of Production for Grade Cows

By Professor F. W. Woll

The first certificate in the California state register of production for grade cows which was established last year by the college of agriculture was issued about a month ago to V. M. Del Ponte, a Del Norte dairy farmer, and a member of the Klamath River Cow Testing Association. His cow, Mouslie, a mature Jersey, produced during a lactation period of 243 days, 8,528 pounds of milk and 360.50 pounds of butter fat (average test 4.22 per cent). Certificates have since been issued to 18 other cows in this association and applications for admission to the register have been received for a considerable number of cows whose production is now being reported to the college of agriculture each month.

The production of the 19 cows at present admitted to the grade register range between 350 and 457 pounds of butter fat for the 10 month period, or an average of 384.3 pounds. This is very good for a beginning, especially in view of the fact that all these records were made outside of what is considered the best dairy sections of the state. The highest record so far made was that of a grade Jersey, 12 years old, owned by G. B. Von Alvensleben, of Del Norte County, which produced 8,486 pounds of milk and 457.08 pounds of butter fat (average test 5.38 per cent.)

The register of production for grade cows in this state is, therefore, now in full operation, and the college of agriculture is prepared to receive applications for admission to the register from California dairymen, whether members of cow testing associations or not, under the rules and regulations governing the register. Under the rules adopted, the record period is ten months. In order to qualify for a certificate, cows with first calf or more must produce over 350 pounds of butter fat during this period, and heifers with first calf and under three years of age at the time of freshening, must produce at least 300 pounds of butter fat. In addition, a cow must carry a calf at least five months during the 10 month period, and must be free from tuberculosis so far as is known. A further requirement is that the owner of cows to be entered must agree not to use or dispose of their male offspring for breeding purposes.

Up to January 1, 1924, cows will be accepted for first entry in the register, without regard to the breeding of their sire, but after that date, only cows sired by a pure bred registered dairy bull will be entered on the register.

There are no expenses connected with admission of cows to the register, and the certificates of production are issued free of charge to owners of cows that have met the requirements given above.

The register of production for grade cows was established by the college of agriculture with a view to improving the dairy herds of the state through establishing production records and giving distinction to cows that qualify for the register. The result will be that extra efforts will be made to have these cows do well and to develop their heifer calves into valuable future members of the herd. The latter point will be of increasing importance as dairy farming becomes a more specialized business and as farmers appreciate more the value of good dairy cows and learn that they cannot, as a rule, reach and maintain a high standard of production in the herd unless they take advantage of the progress made, and build up the herd from their best cows.

The California grade register is based upon the work of the cow testing associations in the state and is conducted in cooperation with these associations. Grade cows tested under the rules governing the system of semi-official tests of dairy cows in this state, are, however, also eligible for a certificate, and many such cows will doubtless be entered on the grade register in the future, as this becomes better known and appreciated by our own dairymen. The register is intended to do for owners of grade cows what various Advanced Registers are doing for pure breds and offers similar opportunities to all owners of grade cows in the state to win recognition for all high-producing cows that they may own.

Further information concerning the grade register, with rules, record blanks, etc., will be supplied upon request by the division of animal husbandry, University Farm, Davis, California.

BREEDING SEASONS OF DOMESTICATED ANIMALS

Among the wild animals the breeding season is fairly definite. This, however, according to investigators, is not true in the case of domesticated animals. The investigators inform us that "the breeding season has become much obscured or wholly lost in most of the domestic animals."

Of the domestic animals most of the breeds of sheep retain the definite breeding season by lambing in the spring as did their wild forbears.

More colts are foaled in the spring months of April, May and June after carrying the young a period of about 11 months from the time of conception to the period of birth. While it is true that more colts are born in the spring than at other times of the year a great number are born at other seasons.

It has been estimated that about 50 per cent of pigs and calves are born during the months of March, April and May and in both cases there is a secondary increase in the number of births in the fall. Many swine breeders recognize this fact and breed their sows at periods when it is possible to produce profitably two litters a year.

In the ewe a number of periods of heat occur during the fall breeding season provided fecundation does not occur early in the season. Each period of heat lasts two or three days and recurs at intervals of two or three weeks.

Normally, mares come in heat about nine days after foaling. Their period of heat lasts several days and through failure of coition or fecundation is again repeated at intervals of three or four weeks.

The period of heat in the cow occurs from six to eight weeks after calving if the young is suckled; otherwise, the period of heat begins three or four weeks after the calf is dropped. The heat period in the cow as a rule lasts only about one day and sometimes does not continue that long and recurrence of the period takes place normally about every three weeks.—State Department of Agriculture.

HOW TO COMBAT SCOURS

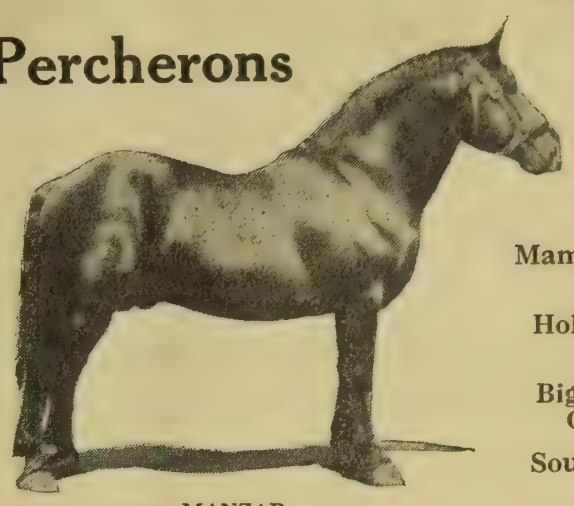
"Like all diseases of cattle," says M. H. Fohrman of the dairy husbandry division, university farm, "prevention is the best method of combating scours. Ordinarily scours, as distinguished from white scours or calf cholera, can usually be traced to overfeeding, irregular feeding, dirty pails, cold milk, sour milk, or old milk, and any one or all of these are due to carelessness on the part of the feeder.

"Constant vigilance is the price of healthy calves. As soon as trouble is detected, the feed of the calf should be reduced at least half. Administer a dose of castor oil in warm milk by means of a small drenching bottle. This will tend to remove all irritating substances from the bowels. Feed should then be gradually restored to the normal amount, and formaldehyde solution should be added to the milk at the rate of one teaspoon per pound of milk. This solution should be made up of one part of formalin (40 per cent solution of formaldehyde) to 31 parts of water. If prompt improvement does not follow this treatment, repeat the dose of oil and accompany it with another reduction in the feed.

"Calves are always greedy, and for this reason overfeeding should be avoided. This is true particularly when alfalfa is being fed, as it is exceedingly palatable and the animal is apt to gorge itself."

Santa Anita Rancho

Percherons



MANZAR

Pure Bred Registered Percheron, Arabian, Thoroughbred Horses

Mammoth Jacks and Jennets

Holstein-Friesian Cattle

Big Type Poland China Swine

Southdown Sheep

A four year old son of the prize winning stallion, Althazar, and out of the imported mare, Mancelle. Jet black and of exceptional quality, size and action. Weight 2,190 lbs. with clean, flat bone and the best of feet. An outstanding individual possessing in a marked degree the necessary qualifications of a great sire. His general style and conformation appeal at once to the lover of the draft horse.

The rancho has for sale three four-year-old, three two-year-old and three yearling stallions including Manzar and a two-year-old full brother. All are of exceptional size and quality, and were bred and developed on the rancho. All stock guaranteed.

All well mannered and broken to service in the breeding yard

Masterpiece of Edgemoor

The Greatest of All Guernsey Bulls—For Which $40,000 Has Been Refused

Masterpiece was sired by Royal Rose King of Edgemoor who was by Imp. Itchen May King, grand champion of the P. P. I. E. in 1915 and grand champion National Dairy Show in 1920. Royal Rose King of Edgemoor was out of Belladia who made 934 lbs. of butter fat in 365 days in the certified milking barn.

Masterpiece is out of Jessebel of Edgemoor whose record of 12,434.9 lbs. of milk and 748.3 lbs. of butter fat at two years of age makes her the best daughter of the great Ne Plus Ultra.

Masterpiece combines great show-type with high production.

The females we offer for sale run high in the popular May Rose blood and Masterpiece combines all of the great May Rose blood lines.

The heifers are from good A. R. dams and will make excellent records. We are offering Californians a chance to get Guernsey females that cannot be duplicated and the price is right.

All animals tuberculin tested and guaranteed clean. Call or write at once.

What is the Matter With Hogs?

By R. P. Royce

ONE of the most persistent questions reaching this office is the query as to what is the matter with the hog business. So far as the writer has been able to discover the answer is that the trouble isn't so much with the hog business as with the hog owners, or, rather, the men who once raised hogs.

During the war period when the market price for pork soared to unheard of levels, the swine industry underwent wide expansion. Men entered the business with little or no knowledge of the problem of pork production; it was enough that the word had been sent out from Washington that the world needed pork and fats. The pork market was reflected in the values set for breeding stock and in many, many cases men of otherwise sound judgment began speculating in hogs. That many of our swine "breeders" went in on a high tide was clearly recognized, and when values began to recede a lot of these men were left high and dry, and in some cases financially impaired, on the wreckage of their ventures.

The mistake was made in allowing values for some breeding stock to get too far out of line with the actual market, and too many men engaged in the business as "breeders" instead of pork raisers and failed to keep their operations on a practical basis.

The mid-west was the center of the wildest orgy of speculation. With but few exceptions the business in this state was on a fairly sound basis, except for the fact that a number of our breeders attempted to follow the tactics of their Eastern contemporaries.

When the bottom dropped out of the pure bred swine business in the East, Californians got scared and made a dash for cover that stands out as one of the most "ignominious retreats" in the history of our livestock development. They threw up the sponge, declared themselves disgusted, put on blue—very blue—spectacles, and either got out of the business as best they could or have been conducting their activities on a basis that could not possibly attract custom.

Now what is the real situation in the hog business of California?

At the present time, and for the past several months, California has had the best market in the country.

Under present feed and labor charges and markets there is the widest margin between production costs and selling prices we have enjoyed for years.

For the past six months and at the present time, California pork packers have found it necessary to buy a large per cent of their supply in Eastern states. Hundreds of carloads of hogs have been shipped into San Francisco, Los Angeles and other coast markets.

California is not producing enough pork to fill local demand and, census figures notwithstanding, there is a smaller number of swine on farms in this state than for several years past.

Our grain and feed markets are at levels permitting an actual profit in feeding operations and such markets are likely to stay at such levels. And finally, there is scarcely a ranch in the state that can not carry a few hogs if only to utilize waste feed.

The hog business is as sound as any other business that can be called to mind if conducted on sane lines.

There is an economic need for more hogs and more hog raisers. We don't particularly need more "breeders." We do, however, need more men to raise good hogs, men who are willing to keep their operations on a basis where their hogs are making them a profit as a pork proposition and who are satisfied to sell carefully grown and selected breeding material at prices based on sound values. We haven't an outlet for five, ten or fifteen thousand dollar boars and sows, but there is an unlimited outlet for boars and sows at prices ranging from $30 for pigs up to $65, $75 and even $150, occasionally, for older stuff.

The hog when properly handled has always been a profit maker and will continue to pay off mortgages.

Don't worry about a few speculators who got pinched. Ask J. I. Thompson, for years with the college of agriculture and now managing a large farm, what he thinks of the hog business, or put the same query to Mark Bassett at Hanford, A. B. Humphrey at Escalon, Harvey Berglund at Dixon, or any of the men who have kept their feet on the ground. They have raised hogs for years and are raising them today—and as far as we know they continue in good standing with their bankers—pretty strong evidence, say we, just now.

Hundreds of Cultivator readers will find it quite profitable to raise a few hogs, and there never was a better time to buy than now. Remember, the time to go into a business is at low tide.

PACIFIC COAST JERSEYS WIN HIGH HONORS

In a recently compiled report of the medal awards for 1920, issued by the American Jersey Cattle Club, 71 Jersey cows in the United States qualified for medals under the rules of the club. Of the ten highest records made in the year, six were made by Pacific Coast cows with an average production of 887.21 pounds of fat.

Ten cows, by reason of superior performance, won more than one medal each, and of these seven were Pacific Coast Jerseys. Nineteen states are represented in the awards made. Oregon ranks first with 18 gold, three silver and one bronze; Ohio, second with eight gold and one bronze; Maine, third with seven gold and two bronze; Massachusetts, fourth with five gold and one silver; and Washington, fifth with five gold medals.

Heading the list of breeders of medal winners is J. M. Dickson & Son of Shedd, Oregon, with seven, followed by G. G. Hewitt, another Oregon breeder, with four, and Hood Farm of Massachusetts in third place. In the list of sires represented by medal winning daughters, Valentine's Ashburn Baronet ranks first, credited with five, followed in order by four other Oregon bulls.

California is represented in the list of medal winning cows by Noble's Sayda Polo 307199, owned and tested by J. W. Coppini of Ferndale. Her record is 750.61 pounds fat. Bonnikson Bros., also of Ferndale, were awarded a silver medal on Bonnie's Financial Loretta 397486 in the class for cows over two and one-half years and under three. She produced 655.18 pounds fat.

The territory embracing the Pacific Coast states, with only nine per cent of the registered Jerseys for the year, won 42½ per cent of all medals awarded.

This places the Pacific Coast states in the foremost position in the United States for high producing Jersey cattle.

CONTEST FOR CLUB BOYS

Probably the greatest gathering of boys in the history of club work will take place at Atlanta, Georgia, October 19 to 21, 1921, when club boys representing practically every section of the United States will take part in an International Club Judging Contest. The seven winners in this contest will be given a trip to the English Royal Stock Show, and hundreds of dollars will be distributed as additional prizes. This contest is under the supervision of club leaders representing the state agricultural colleges and the United States department of agriculture.

Even though the contest is several months off many club leaders and members are showing an interest in it and have expressed their willingness to send judging teams. The team from Texas, which defeated the entire field last year, is now completing preparations for the trip to Europe. That state will be represented again at the contest in Atlanta, but this year there will be more competition. for teams from Mississippi, Louisiana, Virginia, Oklahoma, Florida, Arkansas, Alabama, Kentucky, North Carolina and South Carolina are preparing to enter. Several other states in the North and West have signified their willingness to send teams to the contest if suitable arrangements can be made.

CARE OF HORSES' SHOULDERS

By G. E. Gordon

As warm weather approaches and the work on the farm increases there is a resulting increase in the number of sore shoulders found on work stock. This is due in many instances to poorly fitted collars and is also aggravated by excessive sweating, which without proper care tends to make the horses' shoulders very tender and causes them to gall. As is the case with many other troubles, it is more satisfactory to prevent than to cure them. It is extremely important to have the collar well fitted to the horse. It is also important to have the hames fit the collar properly. If this is not done, even though the collar may fit properly, the hames exert an undue pressure at certain points, causing the collar to become misshapen and fit improperly.

It is often desirable to have sweat pads on the collar, although they hold the heat and often cause excessive sweating. The collar or pad should be cleaned every night and should be kept soft and pliable. It is also desirable to wash the horses' shoulders off each night with fresh, cool water or water in which a little powdered alum has been dissolved, which will tend to toughen the skin. If the shoulders are galled it is especially desirable to wash them well every night, after which they can be treated with one of several different things. Powdered sulphur mixed with powdered alum is sometimes used with good results. Boracic acid is also healing.

A very satisfactory solution to apply on sore shoulders is White Lotion, which is made as follows: Lead acetate 1 ounce, zinc sulphate ½ ounce, water 1 quart. This should be applied every evening as soon as the collar is removed. It is also desirable at times to remove the collar at noon and wash shoulders in fresh, cool water before putting the horse to work in the afternoon.

Selecting a Good Dairy Sire

SOME very practical advice is offered to guide in the selection of a dairy bull by a writer in the Indiana Farmer's Guide. This writer points out that in the selection of the dairy sire there are various conditions to be taken into consideration. There is an old saying that the sire is half the herd, and some have gone so far as to say that he is the whole herd. This last statement is especially true if it happens to be a scrub bull at the head of a herd of good dairy cows. Instead of raising the dairy qualities in the offspring over that of the dam he is lowering them, and for this reason the scrub sire with or without a pedigree is worse than none at all.

The ideal animal is one that will transmit the dairy qualities of his ancestors with uniformity to his offspring. To do this the sire must first of all have a line of ancestors that have been heavy producers. The more generations this line of ancestors dates back the greater will be the probability of his transmitting these desirable qualities to his offspring. Each animal inherits 50 per cent of its blood from its parents, 25 per cent from its grandparents and 12½ per cent from the third generation. The relative value of the ancestors can be reckoned accordingly, and in taking this into consideration a fair estimate of the value of the pedigree can be made. When studying the pedigree it is well to remember that official records mean more than private records.

After giving the pedigree due consideration the next thing to do is to look over the animal carefully. Of course, he should be attractive looking, for we always think more of things that look good to us. No bull should be placed at the head of a herd if he is not a strong, vigorous animal true to breed type. A dairy bull that is fine boned and has a feminine appearance is very undesirable and is less likely to transmit his dairy qualities together with a rugged constitution which is so much needed by a high producing dairy cow, as is a good, strong, vigorous bull with a masculine appearance. There are some who refuse to use a bull from a phenomenal record making cow for fear the vitality of the calf will be weakened. The majority of breeders, however, want the dam to have the highest record possible, other things being equal.

There is one type of animal that is meeting with disfavor among progressive dairymen and that is the animal with the sloping rump. A cow with a drooping tail head is always short between the hook and pin bones and short in the quarter. This gives an udder that is long and pendulous and usually lacking in the fore quarters. While there are some good cows that have this fault, all our highest record making cows have good straight top lines and well balanced udders.

Some dairymen will not keep an old bull because he is too heavy or they do not wish to be bothered keeping him from year to year after he is about four years old. It is at this age when a bull will prove his value. When buying a bull an aged animal that has proven his worth should always be preferred to a calf, as there is no certainty what a calf will develop into.

Some seem to think that a pedigree and an official record carry with them something frightful and they are afraid to tackle an animal that has any such thing or is related to animals that have recorded ancestors or that have been tested for capabilities and productiveness. If they would consider the matter a little they would see that ancestral influence is a matter of extreme importance. The fact should be kept in mind that it is the cows of certain lines of breeding that are the descendants of good producing animals that make the phenomenal records and that such cows are held and sold at very high prices. It is much cheaper and better to raise the good cows than to take chances of buying them. If the sire has a good constitution and great strength of character along the lines of heavy productiveness then we may expect to see him stamp his impress on the herd and prove of great value. If the cows in the herd are not as strongly bred as the sire then we may anticipate great improvement, and in point of value as a breeder the bull is more than half the herd.

No one has a good excuse for selecting or using a bull of second rate or ordinary breeding for good, pure bred sires can be easily obtained and at a satisfactory price. If all the dairymen and dairy farmers in this country were to give the proper attention to selecting dairy sires, millions of dollars would be added to the dairy herds, and the profits on the dairy products of the country would be increased by millions. While no dairyman should consider a few dollars when buying a bull, a fancy price is not always an indication of the true worth or merit of an animal.

BOVINE LAMINITIS

In sections of the country where it is difficult to procure transportation for animals it is not uncommon to find cattle which are driven long distances over hard or rough roads suffering from an inflammation of one or more feet, known as laminitis.

Other conditions such as the consumption of food high in protein or compelling the animal to stand for a long time, especially on a hard surface, may sometimes produce the disease. Breed is also said to exercise an influence on the disease. Some observers have noted that cattle reared in a flat country are more frequently affected than those in mountainous districts. The reason advanced is that the space between the toes (digits) is wider in the former than in the latter.

Many stockmen with an inquiring turn of mind have observed this condition in cattle and the state department of agriculture finds that a number of them are able to diagnose the disease quite readily. When the condition is noted in the standing animal the symptoms will be similar to those seen in the horse so affected. The inflammation under the horny tissue induces the animal to stand or walk on the heels as much as possible. During the development of laminitis there is a loss of appetite, a marked thirst, the muzzle is dry, and there is usually a considerable rise in temperature, sometimes reaching 105 to 106 degrees Fahrenheit. The treatment of the affection in cattle is the same as applied to the horse so affected, which consists in applying or administering agents that will remove the congestion of the tissues underlying the horny wall.—O'Toole.

A 30 POUNDER

Manager Cash of the Sierra Vista Stock Ranch at Perris reports some fine seven day records made by Sierra Vista producers. For instance, Dorothy Pontiac, junior four year old, has a record of 527 pounds milk and 30.04 pounds butter under official test. Other producers are: Juliana Canary Mercedes, junior three year old, milk 640 pounds, butter 27.59 pounds. Rosamaines Nancy Spofford, junior two year old, milk 404 pounds, butter 19.98 pounds. Juliana Nancy, senior two year old, milk 430 pounds, butter 16.18 pounds. Juliana Hartog Walker Hengerveld, senior two year old, milk 405 pounds, butter 20.57 pounds. Rosamaines Novena Netherlands, junior two year old, milk 481 pounds, butter 22.51 pounds; Juliana Hengerveld Pietertje, senior two year old, milk 419 pounds, butter 16 pounds.

CONTROL OF STABLE FLY

The numbers of stable flies can be kept down by caring properly for stable refuse and by properly stacking or otherwise disposing of straw in a way that will not make it attractive as a breeding place for the flies. Flies cause much distress among animals and at times heavy losses. Control measures are described by the United States department of agriculture in Farmers Bulletin 1097, "The Stable Fly; How to Prevent Its Annoyance and Its Losses to Livestock."

MOLASSES

"..on test as well as the milking herd"

says Mr. Hartsook, Lankershim, Cal.

Camo Molasses is a stock food of all-around value. Breeders are feeding it to the cows on test and find that its tonic effect is to make a cow eat much more food than usual, and at the same time keeps the cow in perfect condition.

And for the ordinary milking herd, it acts as an appetizer and conditioner profitable far beyond its actual cost as a feed.

Get our booklet that tells all about Camo Cane Molasses. Every man with stock to feed will find it both valuable and interesting. Send a postcard.

LIVESTOCK

Shorthorns, Shropshires, Berkshires, Shetland Ponies, Bronze Turkeys. W. P. Rocks, Butte City Ranch, Box C, Butte City, Glenn County, California

PAINT PRESERVES AND BEAUTIFIES

(Continued from Page 77.)

boots soon wear off the paint. What is the best and cheapest covering which will stand the wear and how should it be applied?"

2. "My living room floor was 'oiled' some years ago but is now worn to the wood. How may I restore it? I wish natural wood finish. Where wood is worn down to grain should I use filler in order to make the wearing coat last longer?"

3. "Where old floor is now too dark is there any way of lightening it other than to paint? That is, is it possible to lighten a natural wood finish?"

4. "Should a different paint be used for outside porch floor and steps than for inside floors?"

5. "Where floor has opened up with wide cracks is its restoration from the use of paint or filler possible or must it be relaid?"

Chicago Varnish Works Answers

1. There is nothing that we know of except to keep on repainting the floor of the back porch unless you put linoleum or some metal over the wood.

2. Remove all finish with paint and varnish remover. Bleach out the dark spots with oxalic acid and be sure that you remove the oxalic acid after the wood is bleached, with clean water. When wood is thoroughly dry, fill with natural paste wood filler and apply two or three coats of good floor varnish. (Paste fillers to be used on open grain hardwoods only; closed grain woods require no filler.)

3. Same process to apply on this question as on No. 2.

4. Many manufacturers make porch and steps paint especially adapted for outside work and also have an inside floor paint. Inside floor paint dries much quicker than the outside.

5. Manufacturers make a crack and crevice sealer which dries very hard. Depends entirely on how wide the cracks are as to whether this material can be used successfully. The wider the crack, the less successful you will be in having this matter stay in place.

The Sherwin-Williams Company

1. S.-W. porch and deck paint is the product we recommend for porch floors subjected to rough usage. The surface to be painted should be free from grease and soot, and perfectly dry. If the job has been previously painted and is peeling, scaling off or cracking, burn or scrape off all the old paint. If this is not done the new paint cannot adhere.

2. If the "oiled" floor has been worn down to the wood, it can be thoroughly scrubbed first. Then a stain in the color desired should be applied and if the wood is open grain, a paste filler should follow. An oil stain should be used in this instance. After the filler has thoroughly dried, follow with two or three coats of a good floor varnish.

3. There are two ways in which a floor may be made lighter. You can either have it scraped and finished as for a new floor, that is, stained, filled if open grain wood, and varnished. The simpler method would be to apply two coats of ground color and then follow with a varnish stain such as our Floorlac.

4. Porch and deck paint is recommended for outside porch floors and steps. Floorlac or S.-W. inside floor paint should be used for inside floors.

5. S.-W. crack and seam filler will satisfactorily take care of wide cracks in a floor which is to be painted.

National Lead Company

1. Ordinary paint is not sufficiently hard for the finishing coat for the floors of rooms and porches which are subjected to excessive wear caused by people continually walking on them. Paint for priming and undercoats for this purpose may be made the same as for regular wood painting, but the finishing coat must be specially prepared. Excellent results may be obtained by first applying a finishing coat of paint made with white lead in oil thinned down with Dutch Boy Flatting Oil or turpentine instead of linseed oil, and then covering it with a coat of floor or porch varnish after the white lead paint has dried. The finishing coat may also be made by adding some floor or porch varnish to the white lead paint. An excellent formula for this purpose would be as follows: 100 pounds white lead in oil, 1 gallon raw linseed oil, ½ gallon floor varnish, 1½ gallons turpentine, ½ pint drier. Such a paint will dry quite hard and resist wear, but we would offer the caution that only the best floor varnish should be used. This formula may, of course, be tinted to any desired color by adding the proper tinting materials.

2. The method of restoration of an old wood floor, which has been oiled, depends on whether the wood is soft or hard. If the wood is soft and is old and soiled, it must first be washed

clean with soap and water, and if badly discolored should then be bleached by applying a dilute solution of oxalic acid in water to the discolored spots. After the wood has been bleached it should again be washed to remove the oxalic acid, and when dry should be sandpapered until it is smooth. A coat of shellac should then be applied to fill up the uneven places, and after the shellac is dry the surface should again be sandpapered. If a stain is desired it may then be put on over the shellac, and when the stain is dry, from one to three coats of floor varnish will give the finish. If the floor is hard wood, it should be cleaned and bleached, as already described, and after being sandpapered should first have a coat of regular wood filler applied. The filler is prepared by thinning down the paste filler with turpentine. This should be well brushed into all of the pores of the wood, and if a stain is desired, it may be added to the filler. After the filler is dry a coat of shellac should be applied and then the coats of finishing varnish.

3. This question has already been answered under No. 2, except to say that if the floor is discolored all over or is darker than desired, all of the old varnish should first be removed with a strong solution of soda in water. The soda solution is applied to the varnish and the loose varnish and soda are then thoroughly washed off. When perfectly dry any dark spots may be bleached with oxalic acid and the floor may then be finished as described in the reply to question No. 2.

4. Porch floors which are to be exposed to the weather must withstand the elements as well as the wear. The recommendations made in the reply to question No. 1 also apply to this question. Where varnishes are used it may be found that some of them which withstand the wear and give excellent results will not be suitable for porches. Only the best floor or deck varnishes should be used for the outside work.

5. Cracks which have opened in an old floor may often be filled with putty. The floor should first be cleaned thoroughly with soap and water. When the floor is dry a thin coat of priming paint should be applied to the cracks, and they should then be filled with putty. The best putty for this purpose is made by adding a small amount of Japan drier and a small amount of rubbing varnish to paste white lead, and then stiffening the paste with dry whiting to thick putty consistency. This putty should be rubbed well into the cracks until they are completely filled. After the putty is dry and hard it should be sandpapered off smooth, the entire floor being gone over until the surface is in good condition. After the floor has been sandpapered, paint may be applied in the usual manner.

Demanding Justice in Freight Rates

URGENT and persistent appeals for relief from the oppressive and prohibitive freight rates on California vegetables continue unabated from all vegetable growing sections of the state. Growers are unable to bear the extortionate charges now made in shipping their products to their usual destinations and the excessive rates so restrict the marketing territory where the California products find their outlet that returns commensurate with the cost of production are not secured.

The grave situation which now exists is causing widespread anxiety and demanding the attention of extensive growers, growers organizations, farm bureaus, marketing agencies, chambers of commerce, banking institutions, agricultural periodicals and daily newspapers from the Mexican boundary northward. Protests in telegrams and letters have been sent to Washington and Chicago in great numbers. Resolutions have been adopted denouncing the imposition of these onerous rates by the interstate commerce commission and the greed of the carriers in exacting them. Facts, figures and competent testimony have been fully presented to demonstrate conclusively that growers have sustained heavy losses shipping under these rates. The governor of the state has telegraphed the president of the United States at length, emphatically requesting the assistance of the chief executive in this urgent matter. Men prominent in the industry have made transcontinental trips to present the subject personally before the proper officials. Meetings are being held in the northern, central and southern parts of the state to discuss the question by growers. In fact, nothing is being left undone which may tend to bring relief from the appalling situation, and these efforts must continue unceasingly until results are obtained.

The consequences of the high freight rates are truly alarming. Already the acreage of cantaloupes in this portion of the state has been reduced more than 50 per cent. There have also been big reductions in the acreage of onions and celery in the Delta, amounting to 20 per cent and 33 per cent, respectively. And these are only the beginning. Much greater reductions in these acreages are threatened and unless material cuts in rates are made the acreage of cabbage, spinach, early onions and early potatoes will probably be only a shadow of what it was formerly. Action must be had promptly to save these industries. Millions of dollars worth of crops and property of still greater value are involved.

The importance of the matter to the general public of the state cannot be overestimated. Between 40,000 and 50,000 cars of vegetables are the normal annual shipments of the state. Some of the richest and most intensively cultivated lands in the state are devoted to the culture of these products, and in some sections entire communities are dependent largely upon the revenue which they return. That the question of freight rates at this critical juncture has a far reaching effect upon the general prosperity cannot be denied.

At a meeting in Los Angeles, July 5, of members and directors of the San Fernando Valley Potato Growers Association, San Gabriel Valley Potato Growers Association, San Bernardino Valley Potato Growers Association and Shafter Potato Growers Association, the following resolution was unanimously adopted:

Whereas, the interstate commerce commission placed in effect last August a horizontal increase of 33 1/3 per cent in freight rates on transcontinental business, which established a prohibitive rate on California vegetables and has already caused enormous losses to the vegetable growers of this state, and

Whereas, horizontal increases in freight rates are unsound and fundamentally wrong in principle, and especially disastrous in their effect on bulky and low priced commodities such as vegetables, particularly in the case of California vegetables which are shipped over long distances, and

Whereas, entire crops of California vegetables have, during the present season, been sold below cost of production, and our potato crop is now being sold below cost of production, due to unfair and prohibitive freight rates which unduly restrict our available marketing territory, and

Whereas, to the losses sustained by California vegetable growers must be added the much greater losses involved in depreciation of value of lands used for vegetable production throughout the state, which losses are directly due to the same cause, and

Whereas, the truly appalling condition outlined has been brought to the attention of the interstate commerce commission and the carriers, and no relief obtained except a slight reduction in rates on our products shipped to territory east of Chicago, effective only to December 31, which, besides being inadequate, is confined almost exclusively to cantaloupes, there being practically no vegetable shipments from California points to said territory at present, nor will there be for several months, which is well known to the carriers and the interstate commerce commission, and

Whereas, the interstate commerce commission in the face of overwhelming evidence of losses sustained and being sustained by California vegetable growers, takes the position it cannot grant any relief except through the interminable delays of formal proceedings, and at the same time intimates in a letter dated June 24 last, that vegetables are being sold at a profit to growers, which is absolutely false, as far as California vegetables are concerned, and

Whereas, our appeal to the carriers through the California Vegetable Growers Association, for relief in rates on potatoes shipped to territory west of Chicago was denied last week, although supported by indisputable evidence that these potatoes are being sold below cost of production, and

Whereas, the reason given by the carriers for denying our appeal is that their total revenues are not sufficient to cover operating expenses, and to provide earnings authorized by congress, and

Whereas, the California vegetable industry is compelled by the exaction of these prohibitive rates, to pay an undue proportion of the total revenue of carriers, in order to make up for the deficit caused by reduction of tonnage of other commodities, and

Whereas, carriers, through published statements of their executives and other propaganda, are endeavoring to create the impression that increased sihpments of California vegetables indicate a prosperous condition of their industry, although knowing at the same time that it is not true, but on the contrary, that these vegetables have been and are being sold below cost of production, and that these shipments are made because they offered some margin as between market price and cost of harvesting and shipping, and thereby to a slight extent tend to reduce the growers' loss on production cost; therefore be it

Resolved: That we denounce the action of the interstate commerce commission in imposing these rates on this industry, which are destructive and are not only clearly wrongful to California vegetable growers, but are also contrary to constitutional limitation of the interstate commerce commission or other regulatory bodies, which are prohibited under the constitution from imposing rates which tend to confiscate private property, the result of these rates being confiscatory in its effect on the property of said growers; and be it further

Resolved: That we denounce the greed of carriers in holding on to the advantage given them by the interstate commerce commission through an improper use of its authority by the imposition of these prohibitive rates on this industry, while all the time carriers have positive knowledge that while they are exacting payment of these rates by growers, the latter are selling their products at a loss, and also that to this loss must be added the depreciation of value of vegetable lands throughout California, also directly chargeable to these unfair rates, thereby involving the welfare of the state, and be it further

Resolved: That we demand that the interstate commerce commission and carriers, who jointly are responsible for these deplorable conditions, take immediate action to suspend the horizontal increase in rates on California vegetables placed in effect last August, because such increase was fundamentally wrong and contrary to constitutional limitation, and because this industry having already suffered irretrievable losses, cannot wait on the slow process of formal proceedings to obtain relief from the intolerable and gross injustice perpetrated against it, which relief has already been too long delayed; and be it further

Resolved: That after the suspension of the horizontal increase complained of an investigation should be made of the question of freight rates on California vegetables, with a view to determining what rates are fair and equitable to carriers and growers, and that such rates should then be established. In other words, instead of the haphazard method of a horizontal increase in these rates, with its inevitable train of disasters, the method of establishing rates should be guided by fairness and intelligence, both of which characteristics are entirely lacking in the present rate structure.

VEGETATION IN HOT CLIMATES

Soil productiveness in southern Italy is a question of climate which is particularly hostile, through its inconstancy, to green crops, rather than a matter of soil fertility which sometimes is all that could be desired. Generous manuring. which in the northern Italian districts largely increases the yield, may cause a decrease in the south in a dry year. The application of fertilizers containing nitrogen in a mineral form may in certain years aggravate the consequences of drouth and of excessive heat, etc., by causing the drooping and drying up of the aerial organs of the plant ("wilt" of the American agriculturists).

The practices which have brought wealth to the northern Italian districts cannot be generalized in the south where such unfavorable and uncertain conditions prevail; the question is to find out new and suitable methods, but the problem is not yet solved and in the majority of cases no initiative has yet been taken.—International Review, Rome.

Thirty cents an hour with ten hour day and maximum of ten cents a box for piece work were established as wage scale for farm and field labor in Alameda County at a meeting of representative agriculturists last week.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Alien Poll Tax

Are aliens who have taken out their first papers required to register under the alien poll tax act?—Subscriber, Fresno.

Undoubtedly such persons are not only required to register but to pay the tax. They are aliens until by the judgment of the court they may be admitted to citizenship. It may be that the application for naturalization may for some reason be rejected.

Hours and Wages for Farm Labor

How many hours per day or week may a rancher require his men to work? Is there any minimum wage for the argicultural workman?—Subscriber, Fresno.

The law has seemed to consider that the man can take care of himself in the making of a contract for labor and has therefore confined itself in the regulation of hours of labor and minimum wage to women and children.

Option to Purchase

An agent procured a written option for 30 days for the purchase of a piece of real property. He has raised the price and turned the property over to another agent to sell. Did he have a right to do this?—Subscriber, Burbank.

An option to purchase property is a contract made for a consideration whereby the owner agrees to sell the property at a certain price at any time during the period of the option to the party procuring such option, or his assignee. There is an absence of any requirement to pay that distinguishes this contract from one for the purchase of the property. If the party who has procured the option decides to take advantage of it and complies with its terms within the period, the owner may be compelled by an action in specific performance to comply with his agreement. It matters not, of course, what, if any, additional price the holder of the option may be able to obtain from some third party. If the bargain which the owner made with the holder is performed, such owner should be satisfied.

Estate to Wife and Child

A few years ago I deeded land to my son. Later he married and died, leaving a wife and child. To how much of this land is the wife entitled? How much should go to the son? Have I any right to it?—Subscriber, Turlock.

If the decedent leaves a surviving wife and one child the separate property goes in equal parts to them.

Contract

My married son started to purchase land on contract, but at the time of his death he had not made any of the payments on the principal and only a portion on the interest and taxes. Can his widow compel me to proceed with the contract?—Subscriber, Turlock.

The death of the son makes no difference with respect to the rights of the vendor. If the terms of the contract have not been fulfilled and by such terms forfeiture is provided in case of non-fulfillment the vendor can justly refuse to complete the contract. If the contract is recorded he would be entitled to bring suit against the administrator of the estate and to rescind the contract and quiet title to the land.

Wife's Property

At my husband's death in the east I was left certain property. I have since married. If I purchase land in California and have the deed made in my name only what happens to the land at my death? I have children by a first marriage; so has my husband; none by the present marriage.—Subscriber, San Diego.

This property would be the separate property of the wife and in case the title is held in her sole name there is a presumption that it is her separate property, so that she can sell or encumber this property without the signature of the husband and can by will convey it as she sees fit in case of death. If, however, the wife die without will, the husband would be entitled to one-third in case she has more than one child or one-half in case she has one child.

Alley Vacated

An alley running north of my place has been vacated. The parties who own the property on the other side of the street claim that the alley is all theirs. Is this correct?—Subscriber, Los Angeles.

An alley or street is usually a mere easement over property granted for purposes of travel. In case of vacation of the alley the public releases to the original owner the right acquired for alley purposes. If the alley was originally made entirely over the property of one party, then upon its vacation it would return to that party, so that it would be necessary to look up the record to ascertain whether the contention of the parties in this case is correct or not. Usually, where lands are sold, bounded by a street, and there is no other description, in case of a vacation of a street the law presumes that the property owner takes to the center of the street, but if the street was taken from one single individual then the whole of the street would return to the party from whom the property was taken.

KROGH PUMP AND MACHINERY COMPANY
147-159 Beale St., San Francisco, Cal.

Ring Oiling Gland
GOLD MEDAL

Krogh Direct Motor Driven Pumps
We also build deep well turbines, deep well plungers, horizontal and vertical pumps for mining, irrigation, drainage.

THE AUTO-OILED AERMOTOR
A Real Self-Oiling Windmill
Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.
Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.
A year's supply of oil is sent with every Aermotor

Don't Slaughter the Innocents

By Jean A. Koethen

DEAR HELEN: I had to laugh, and I almost cried, too, over your letter. I laughed because your experience was so exactly like my own first try at raising 50 chicks without a mother. I could have cried because it is all so tragic. When you have once watched a thrifty little flock drop off by ones and twos, rushing out every morning in a panic to see what new devastation the night has wrought, and putting them away at night with dark misgivings, you don't forget the pain and disappointment of it.

I suppose every successful poultrywoman has some such experience to start with, but that doesn't make it less tragic. We have to learn, and we don't learn easily, but once the lesson is learned it is learned for good and all. You will never again try to raise fifty chicks and lose them all, I promise you that.

The beginner is quite apt to start out with the idea that chicks are predisposed to bowel trouble. We read about white darrhoea and coccidiosis till we get the idea they are real bogies hanging around our chick yard ready to grab our chicks. As a matter of fact, raising chicks is very like driving a car. If anything happens it is your fault. Just write that on a slip of paper and stick it in your mirror. "If my chicks die, I am to blame."

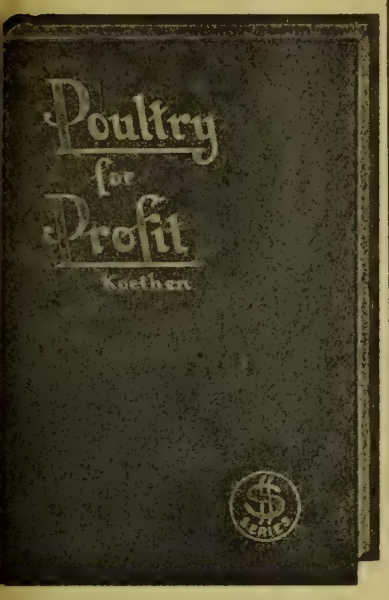
What did you do? Well, for one thing, you did not feed them properly. Rolled oats, bran and buttermilk are all right for the first day or so, but the chick's digestive apparatus is made for grinding hard grain, and if it is given no hard grain to grind, the muscles remain as soft and flabby as they were the day it came from the shell. The best feeders now begin with grain; little seeds like millet cracked wheat, steel cut oats, and such things as a chick can pick up easily. After it has learned to pick up these little seeds, it is given a little bran, either mixed with the grain or in a separate tray or trough, and after the sixth or seventh day a regular chick mash. The grain, which at first was fed on a tray, is now thrown in the litter of dry alfalfa leaves, and the chicks have a busy time digging it out.

But lack of proper feed was the smallest item in your list of mistakes, as it was in mine. Do you remember, when your baby came, what great pains the nurse took to bundle it up and keep the cold air from striking even its little head? "It's used to 99 degrees of heat, "she said, "and we must acclimate it gradually." The chick that is just out of the shell is used to 103 degrees of heat, and if you put it in a temperature 10 or 15 degrees colder there is bound to be trouble. You never thought of that, did you? Neither did I, when I bought my first 50 chicks and put them in a fireless brooder big enough to hold 200, right out in the wind on an open hillside. Chicks have to get used to the air, and they can't do it in a minute. It takes four days at best, and a good deal longer if they are brooder raised.

Your letter did not say how you hovered your chicks, but I know just as well as if I had seen them that you did not keep them warm enough, and that those chicks died of chill. Chicks that are not warm cannot digest their food, and where there is indigestion, with little chicks, there is darrhoea. If a human baby is chilled it has colic. When a chick is chilled it has diarrhoea.

There are all sorts of ways of keeping baby chicks warm. If you have a brooder it is easy, though you must watch the temperature very closely. The fact that the thermometer says 99 doesn't prove that the chicks are comfortable. You can only tell by watching them. If they look perfectly comfortable, lying quietly on the floor of the brooder, you may know they are all right. If they stand around leaning against one another, or keep up a dismal peeping they are cold. The first two days they should be kept under the hover just about all the time

Poultry Can Be Made Profitable



Making use of information gathered from experienced poultry writers who have been guided by their practical experiences will always result in profit from poultry.

Los Angeles, Cal.

except when they are eating. Like a human baby, the baby chick requires first of all rest and warmth.

Oh, there are so many ways in which a chick and a baby are alike! They must be kept warm, they must have simple food and enough of it. By the way, don't let anybody scare you into not feeding your chicks all they want. Now and then somebody bobs up and says overfeeding kills baby chicks. I don't believe it. Chicks have more sense than to overeat. In this they are different from babies. I have always kept mash and chick feed before mine after they learned to eat, and they never die of anything but accidents. When they have had enough they stop eating. You might kill them by feeding too soon after hatching, or by feeding too much beef scrap or corn meal in the beginning, but you won't kill them by overfeeding.

Then a chick is like a baby in its need of exercise. The first four days warmth is its first imperative need. After that time it must get out and run. Fresh air it must have night and day. A clean brooder to sleep in, clean ground to run on, clean litter to scratch in, clean water to drink.

One more word about keeping chicks warm and I am through. If you have no brooder you can do it with a jug or jar of hot water, or with a brick, or just with sunshine alone. Fifty chicks in a box 18 inches square will keep one another warm very nicely if they are in a room that is kept fairly warm by sun or stove. Just keep your mind on it and you will always be able to devise some way of heating even if you do lack the common conveniences. I have known of women who kept them in the kitchen the first week, and that's about the hardest way there is. When you really understand the need, there's always a way of working things out.

I hope you will do better next time, and I know you will. With all kinds of love.—Aunt Susie.

Poultry Queries

(Conducted by Jean A. Koethen)

Price of Eggs

Can you tell me the average wholesale quotation on eggs from 1913 to 1920; also the average cost of a hen per year for the same period?—Subscriber, Modesto.

According to the Poultry Producers' statistical table, which begins with 1915, the average price of eggs for 1915 was 28.97 cents; 1916, 31.20; 1917, 35.06; 1918, 51.61; 1919, 54.64; 1920, 55.83. The cost of a hen per year for 1915 was $2.80; 1916, $2.86; 1917, no figures given; 1918, $3.80; 1919, $3.93; 1920, $4.23. I do not know where the figures can be found for 1913 and 1914.

Sick Turkeys

When my little turkeys are about three weeks old they become droopy, do not eat, and soon lie down and die. Some have convulsions, some, but not all, have foamy droppings. On dissecting them I find liver and intestines normal. They have no lice. I have been starting them on egg and changing to curd in four or five days. They also have a mash, charcoal, grit and alfalfa range.—Subscriber, Brawley.

The best nursery ration for poults is a mixture of hard boiled egg, stale bread or rolled oats and fine cut alfalfa or onion. Make the greens half the mixture and the cereal and egg in equal parts the other half, and sprinkle fine sand or chick grit over each meal for the first three weeks. The most successful breeders continue this ration, without much change, for five or six weeks, feeding three or four times a day, then change to bran or mash and barley. Possibly feeding egg alone at the start upset the digestion of your birds; possibly they were chilled; possibly you overfed or underfed. The digestion of a very young turkey is so easily disturbed it is very hard to strike the happy mean. When poults die as suddenly and as early as this chill is most likely to be the cause.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

Santa Cruz: Report for ten days ending July 10, 1921:

The flock production for the ten days averaged 60.8 per cent. Alex. Stewart's pen led with a score for his ten White Leghorns of 81 eggs. This establishes a new record for July laying. The high pens were as follows: Alex. Stewart, Santa Cruz, 81 eggs; W. J. Neef, Santa Cruz, 78; Geo. Gray, Santa Cruz, 77; S. L. Gibson, Santa Cruz, 76; C. E. Hyde, Seabright, 76; Geo. Wood, Santa Cruz, 75; W. A. Ford, Umatilla, Oregon, 73; Mrs. H. C. Kleinsmith, Hoff, Oregon, 73; D. B. Walls, Petaluma, 73; Gibson, 73; Walls, 72; Warren Wood, Santa Cruz, 72; J. S. Conrado, Santa Cruz, 72.

All pens above are single comb White Leghorns except Mrs. Kleinsmith's which are Barred Rocks.

STATE FAIR PREMIUM LIST

Director Mitchell of the poultry division of the state fair to be held in Sacramento, September 3-11, is mailing the Poultry, Pigeon and Pet Stock Premium List. Judges announced are, in the poultry classes: Robert V. Moore and Charles G. Hinds; pigeons, Wm. J. Head and Robert V. Moore; pet stock, Lewis H. Salisbury. Assistants will be Arthur J. Dixon in poultry; J. G. Mee, turkeys and water fowls; F. M. Washburn, pigeons; Irwin Weisner, rabbits.

CLEANING AND WASHING EGGS

J. H. Barber of the Poultry Producers of Central California writes:

"Eggs with only small spots of dirt on them may be cleaned very effectively by rubbing with steel wool or emery cloth of medium grade. This dry cleaning is preferable to washing. In washing eggs they should not be left soaking in water any longer than is necessary to soften hard dirt. Some use washing powder or sal soda, and there is no objection to this if the eggs are not left soaking in it, and if they are thoroughly rinsed after washing. Ordinary baking soda is better still and will remove light stains quite effectively if rubbed on dry with a damp cloth. We use this in washing on a large scale at our Petaluma warehouse. One of the most important things about washing eggs is to change the water frequently and to rinse all eggs in clear cold water until all trace of the washing water has been removed from them. Do not use hot water either for washing or rinsing, as it will coagulate the albumen of the eggs and make them grade as 'baker eggs.'

"The things that most of all cause washed eggs to spoil are leaving them to soak in dirty water and neglecting to rinse off the washing water. Remember that the shell of an egg is porous, and especially so after the albuminous covering has been removed by washing. If dirty water is allowed to soak through the shell of an egg it will quickly infect it with decay germs which will cause it to spoil rapidly.

Keep Eggs Clean

"Please remember also that washed eggs, when there are many of them on the market, have to be sold for a lower price than unwashed eggs of the same grade. Therefore, while the association will return the same average price on all clean eggs, whether washed or unwashed, if we have many washed eggs they will bring down the average price on the entire grade. The best thing is to have as few eggs to wash as possible, which means to give careful attention to the matter of clean nests and clean floors so as to have very few soiled eggs that will have to be washed.

Pack Washed Eggs Separately

"If you have not enough to fill a case they can be packed in one-half of the case, or if there is less than 15 dozen pack them in the top fillers in one side of a case. Mark them with a separate inside tag so that there will be no mistake about them; also specify them on the outside case tag.

Peppers: Supplies moderate; market weak. Imperial Valley: Bells mostly 15@18; Chili 15@16; poorer 12@13.
Radishes: Supplies moderate, market steady, mostly 15 per dozen bunches.
Tomatoes: Supplies moderate, market weak. Local, 1.75; cr.; per lug 2.00@2.50, few 2.75; No. 2, 1.00@1.25; No. 3, 50@75.
Turnips: 30@35 per doz. bunches.

FRESH FRUITS

Apples: New stock: Supplies liberal, market steady, mostly 3@4, few fancy 5 per lb.; by the lug 1.00@1.25. Crabapples mostly 50@60; few 75 per lug.
Apricots: Supplies light, market firm, 4@6 per lb.
Blackberries: Supplies limited, market strong, 30 pint crate mostly 4.00@4.50.
Cantaloupes: Demand and movement light, market weaker, prices lower. Wide range in quality and condition. Standards mostly 2.00@2.50. Jobbing: Standards 1.75@1.85, few fancy 2.00, poorer 1.50. Casabas: Supplies liberal. Demand moderate, market weaker 2@2½ lb. Jobbing: 35.00 per ton.
Figs: Supplies moderate, market weaker. Northern: Flats Black Spanish mostly 90@1.00. Imperial Valley: San Pedros flats mostly 60@70. Locals: 15@20 lb.
Grapes: Supplies light, market weak. Per lb., Thompson Seedless and Malagas mostly 10@11.
Peaches: Supplies moderate, market steady, wide range in quality and condition. Lugs, various varieties, best 1.50@2.00; poorer 1.00; Early Rose, 1.25@2.00; few fy., 2.00@2.50; Strawberry Freestones, 1.25@1.50.
Plums: Supplies liberal, market steady. Santa Rosas mostly 4@5. Prunes: 4@5 per lb. Satsumas and Climax 4@4½ per pound.
Raspberries: Supplies light, market stronger. Cuthberts 3.75@4.00.
Strawberries: Supplies light, market steady. Per crate No. 1, 3.50@4.00, No. 2, 2.75@3.00.
Watermelons: Supplies liberal. Demand good, market stronger. Mostly 2½, few 3, poorer 1¾@2 per lb. Jobbing: Klondikes 50.00@55.00; other varieties 35.00@45.00 per ton; poorer, 25.00@30.00.

CITRUS FRUITS

Grapefruit: Supplies liberal, market firm. Local: per box, market pack 2.25@2.50, ordinary 2.00, special packed brands 3.00@4.00.
Lemons: Supplies light, market firm, demand good. Local: Packed box mostly 8.00, loose per box 4.00@5.00, lug boxes 1.25@1.50.
Oranges: Supplies liberal, market steady. Valencias, best brands, all sizes, 4.00, few 4.50; ordinary 2.50@3.50; loose pack 1.00@1.50.

HONEY

As reported by the Bureau of Markets:
Los Angeles: Supplies of White Sage, White Orange and Light Alfalfa, heavy. Light wire inquiry. Movement very slow, market steady, little change in prices. Carloads f. o. b. usual terms at loading points: White Orange new crop 12@12½; old crop 10@11; Light Amber Alfalfa old crop 5@6, new crop 5½@6½; White Sage 12@12½. Hawaiian, no sales reported. Beeswax: Market weak, very light demand. Dealers asking 30@33 for light and 24@26 for dark. Estimate of crop unchanged from last report. Sage and Orange crop very uneven, some places normal, others practically none. Exchange expects stronger market but other brokers expect weak and dull market.

GRAIN AND FEEDS

Grain Exch. price bid July 19:
Corn: Bulk No. 2, Yellow 1.62½.
Milo: Eastern bulk, 1.62½.
Barley: Carloads, 1.25.

HAY

Alfalfa Growers of California report prevailing prices f. o. b., Los Angeles:
No. 1 Dairy 19.00
Standard 15.00
Receipts in central markets showed further falling off for the week. Receipts of grain hay show same tendency; most of these deliveries represent shipments made on previous sales. Survey of supplies in hands of users in several of the principal dairy centers near the city shows average stock sufficient only for about a week's feeding. A small number of dealers and users in the central marketing districts have commenced laying in their winter supply, but the large majority are still buying for current wants only. The low prices of alfalfa will undoubtedly cut down the production during the balance of the season, especially in the districts where the high cost of water or transportation forces growers to restrict production.
Present ruinously low prices are not justified, considered from the standpoint of underlying conditions of production and consumption for the year, and still less so from the standpoint of cost of production; it is the present marketing situation, created partly by the general business conditions but mostly by lack of coordinated marketing on the part of unorganized growers, which is responsible for the present price situation.
Receipts light; no improvement in price or tone. Some dealers and users have commenced to stock up for fall and winter. Prices so low that growers in some sections would get practically nothing for their hay, after paying freight, baling, hauling, etc., if they were to sell in the central markets at present prices.
Quotations by Nichols - Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:
Tame Oats .....18.00@26.00
Barley .....16.00@24.00
Alfalfa, No. 1 Dairy 18.00
Standard 16.00
Straw .....10.00@13.00

San Francisco Markets

San Francisco, July 20, 1921.

Quotations made daily by San Francisco Wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by the wholesalers to producers are eight per cent less.

HAY AND FEED

Alfalfa Growers of California state that prevailing prices f. o. b. S. F. are:
No. 1 Dairy.....16.00
Standard 14.00
Under date of July 16, A. W. Scott Co. says:
Receipts at San Francisco, 1,539 tons. Demand has been better; several large transactions in the interior reported. Prices, however, have been so disappointing and low that it seems as though the bottom reached. The government bought here a large export order during the week, but the competition of Oregon and Washington and their immense surplus of hay forced California dealers to sell at prices far below the cost of production. Alfalfa is dragging, with practically no turnover. Mill feeds of all kinds have been advanced.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of switching, cartage, commission and handling expenses must be added according to conditions).
Wheat Hay, fancy.....15.00@18.0
Wheat Hay, fair grade.....13.00@15.0
Tame Oat Hay .....12.00@15.0
Wild Oat Hay, new crop.....10.00@12.0

Oats: Red Feed, 1.25@1.35.
Corn: California yellow, 1.55@1.60 white Egyptian, 2.20@2.30 per cental; California red milo, 2.00@2.10; Eastern red milo, 1.85@1.95; Eastern kafir, 1.75@1.80.

Citrus Markets

Los Angeles, July 20, 1921.

Many growers are anxious for a cleanup and shipments of oranges have been rather heavy. This has resulted in a rather easy tone of the market. About 100 carloads daily are going forward at this time. Orchards are now safely by the June drop and promise is made for exceptionally good production.
Lemons are still commanding at least occasional spectacular prices. The weather has been favorable to heavy sales. F. o. b. quotations are now around $8. Foreigns in sight are still above the 100,000 box mark.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 31,391 cars; lemons, 8,887; total, 40,278. To same date last season: Oranges, 25,133; lemons, 6,317; total, 31,450. From Central California to date this season: Oranges, 6,632; lemons, 211; total, 6,843. To same date last season: Oranges, 5,376; lemons, 289; total, 5,664. From Central California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

REPORT OF CATTLEMEN'S MARKETING COMMITTEE

July 15, 1921.—The fresh and frozen meat in coolers in the United States is less by 109,000,000 pounds than it has been for five years at this date. Prices in Portland and Chicago have gone up in the last week approximately one-half cent per pound. A number of sales of good steers have been reported from various parts of the state at 6½ f. o. b. shipping points. Good cows have sold for an average of 5 cents f. o. b. shipping points. Cattle are moving freely to mar-

ket at prevailing prices. The fat beef cattle are moving steadily to market and it is believed that the available supply of fat cattle will have been exhausted before the run of mountain and Nevada cattle begins. The following list shows the number of cattle sent to market from 22 counties thus far this year:

Amador, 3,545; Butte, 755; Calaveras, 3,022; Colusa, 1,524; Contra Costa, 2,962; El Dorado, 192; Fresno, 11,936; Glenn, 1,860; Humboldt, 120; Imperial, 7,790; Inyo, 923; Kern, 8,378; Kings, 1,410; Los Angeles, 582; Madera, 1,970; Merced, 17,159; Monterey, 4,470; Napa, 333; San Luis Obispo, 3.481; Stanislaus, 21,637; Tehama, 469; Tulare, 18,519.

Do not ship on consignment under any circumstances and do not offer half fat cattle for sale.

TARIFF AND TRUTH IN FABRIC BILLS NOW BEFORE CONGRESS

Active debate on the tariff is now on in the house of representatives. Hearings on the French-Capper truth in fabric bill have just been completed before subcommittee of the interstate and foreign commerce committee of the senate. The representative of the National Sheep and Wool Bureau protested the 35 per cent ad valorem limitation clause in the wool schedule. The wool schedule provides a direct duty of 25 cents a pound on the clean content, but the National Sheep and Wool Bureau points out that with this 35 per cent ad valorem limitation clause on the lighter shrinking wools, the actual protection would only amount to about 6 cents per grease pound and in some instances less.

As an illustration of some of the conditions the wool growers are now contending with, Mr. Secretary Wilson of the National Sheep and Wool Bureau of America cited the instance of an Arizona wood grower who on June 1 and June 15 marketed 1,017 lambs in Chicago, and after paying the feed bill, freight, yardage, commission and other charges, was out of pocket $1,445.41. Farm organizations and the wool growers are uniting in their effort to get adequate tariff protection, and at the hearings just held on the truth in fabric bill not only all the farm organizations and wool growers' organizations, but also prominent retailers and thousands of women and civic organizations, through their representatives as well as representatives of various other organizations, united in their appeal for immediate enactment of the truth in fabric bill. Herman C. Ritter, a well known retailer of Youngstown, Ohio, and ex-president of the National Retail Clothiers Association, presented a telegram from the Ohio Federation of Women's Clubs, with a membership of 100,000, in which it was stated that the women of this club were unanimously in favor of the French-Capper truth in fabric bill.

SALT TOLERANCE OF PLANTS

Salt tolerance of plants is of considerable interest to those who live in low coastal districts and interior plains somewhat alkaline. A bulletin has been published in Italy on this subject, by Dr. E. O. Fenzi, now living in Italian colonial territory in North Africa, but formerly residing for many years in Los Angeles and Santa Barbara, and known as Dr. Franchesci. As an expert in California botany and horticulture his plant lists should have a special value for Californians.

In soils formerly free from salt but afterward impregnated with one and a half per cent of salt it was found that among agricultural crops, cotton, corn, sorghum and tobacco grew well; in vegetables, artichoke, bean, beet, carrot, cabbage, chicory, lettuce, pepper, onion, leek, garlic, pea, tomato and watermelon; in fruit trees, almond, apricot, pear, plum, olive, quince; in ornamental plants and flowers, ageratum, antirrhinum, coreopsis, dahlia, datura, eschscholtzia, calendula, gaillardia, gazania, geranium, pelargonium, iris, sunflower, four-o'clock, lippia, mesembryanthemum, poppy, petunia and zinnia. In trees these did fairly well: Laurus nobilis, Acia eburnea (horrida), Buddleia Madagascariensis, Casuarina species, Cestrum species, Duranta Plumieri, locust and pepper tree.

In plants capable of thriving in soils containing not more than five per cent of chlorides, even if impregnated with water containing three per cent, we have the following list: Aberia Caffra, Acacia cyanophylla, A. cyclopsis, A. Farnesiana and several other species; Ailanthus glandulosa, locust tree, carob, several cypress and eucalypts, Pittosporum species, pistachios, parkinsonia, Pinus Halepensis and pomegranate.

In soils having five per cent of salt and also watered with a five per cent solution, the following species throve—a severe test: Agave Americana and other "century plants," several Atriplex (salt bushes), two species of juniper, several melaleucas and other "bottlebrushes," Myoporum, many cacti, Phoenix Canariensis and the date of commerce, Pircunia dioica, Pinus pinaster and Pinus pinea, and several palms, among them Sabal The latter is our native California fan palm.

GETTING RID OF WEEDS

The University of Wisconsin has published Circular 48 on how to rid farms of weeds, in the summary of which is packed the following information:

The loss from weeds in enormous; fully 25 per cent of the earning capacity of some farms in certain sections is being lost. Millions of dollars can be saved annually by the use of a few simple methods of weed control.

Successful destruction of weeds depends upon a knowledge of the life periods and habits of the plant and the application of this knowledge in the fight against them. Annual and biennial weeds may, for purposes of eradication, be treated alike.

Scattered weeds are best eradicated by cutting or pulling up by the roots while in full bloom. Where they occur in large patches cultivation, rotation of crops and chemical sprays should be employed. The main object is to prevent plants from going to seed.

Perennial weeds offer the greatest resistance and require more thorough and persistent effort. Two of the most troublesome weeds are quack grass and Canada thistle.

Fallowing or cultivation without a crop is the most certain method of eradication on large areas, and may be used to good advantage except on sandy soils and those continuously wet or very porous. Success depends upon the depth of plowing and frequent cultivation. The preventing of all leaf growth in weeds means their certain death.

Small areas may be freed of perennial weeds by covering with paper or by close cultivation.

Special methods for eradicating thistles are the growing of alfalfa, the seeding down of fields to perennial grasses, salting the plants, or applying gasoline or carbolic acid.

Concerted action is necessary. The most noxious weeds can be eradicated, and farmers should cooperate with each other, with the legislature and the experiment stations to rid the state of these enemies to profitable and pleasurable farming.

COMING EVENTS

Eden Township Farm Products Show, Hayward, August 11-14.
North of Bay Counties Fair, Santa Rosa, August 24-28.
Downey Community Fair, Downey, August 25-27.
Yuba County Agricultural Fair, Browns Valley, Aug. 29-31.
California State Fair, Sacramento, Sept. 3-11.
Fall River Fair, McArthur, September 7-9.
San Joaquin County Fair, Stockton, September 12-17.
Tulare County Livestock and Agricultural Show, Tulare, Sept. 13-17.
Humboldt County Fair, Ferndale, Sept. 13-17.
San Fernando Valley Fair and Market, San Fernando, Sept. 13-18.
Glenn County Fair, Orland, Sept. 19-24.

Date Festival, Coachella Valley, Oct. 21-23.
California National Livestock Show, San Francisco, Oct. 22-30.
California Horse Breeders Association, Los Angeles, Oct. 30-Nov. 5.
Pacific International Livestock Exposition, Portland, Oregon, Nov. 5-12.
Stanislaus County Poultrymen's Association Show, Winter Garden, Dec. 4-7.

WALNUT CROP

From a trade circular issued by the California Walnut Growers Association we learn that spot walnuts of 1919 and 1920 crops have long since been exhausted. Prospects for foreign crop are that it will be exceptionally short. Of course, no hint of future prices can be given this early, but regarding total output the circular says:

"Our early prospects were for by far the largest crop of California walnuts ever produced. In fact, our early predictions were for a 60 million pound crop, but late in April frosts played havoc in some of the heaviest producing sections, entirely wiping out the crop on some groves and cutting many others down between 20 and 50 per cent of their original setting. However, as the walnut producing sections of California are scattered over a very large area, some districts escaped with little or no frost damage. A complete check-up of the situation leads us to believe that the total frost damage will not exceed 35 to 40 per cent which will develop a total production of between 90 and 100 per cent of last year's short crop. In other words, the state will probably produce 36 to 40 million pounds.

"It will be remembered that last year there was a considerable carryover of old crop goods, both in the hands of the association and in the hands of the trade, which came into competition with the new crop. This year the situation is entirely different and there will be no such competition. Also, there was a considerable stock of imported goods available for distribution last fall which will not be available this season.

"The maturity of the California crop will probably average a week to ten days earlier this year than last. The average size of the walnuts will probably be a shade smaller than last year, although sizes will average much larger than they did in 1919. So far, since April, climatic conditions have been quite satisfactory, and barring the possibility of an extreme heat wave during the balance of July or August, the cracking quality of the nuts should be exceptionally good. The meats should average plump and light colored."

FARMERS ARE ASKED TO COOPERATE WITH FEDERATION

The California Farm Bureau Elevator Corporation, which has taken over the great grain elevator at Oakland, and which is constructing elevators at several inland points, declares that if bulk handling of grain is to be a great success this year farmers must cooperate. It is said that the terminal elevator is equipped with every labor saving device, that machinery and gravity eliminate costly warehousing and stevedore charges. Farmers are asked to equip with modern facilities in order to complete the chain for the economical handling of grain.

Sack grain will be received at the terminal eltvator, dumped into the bins and the sacks returned. But this method is a temporary one. Farmers are expected to ship in bulk as quickly as they can provide facilities.

Where the farm bureau has built no elevators, farmers are urged to erect loading stations on railroad sidings. It is claimed that such miniature elevators cost but little and that farmers can cooperate in building them. The bulk grain can then be shipped directly to the terminal warehouse where it can be weighed, cleaned and stored. The weights will be made under the supervision of state or government weighmasters.

WANTON DESTRUCTION

Every Sunday during this season of each year, and to a lesser extent on week days, our hillsides are robbed of many spikes of yuccas which, to paraphrase Shakespeare, not enriches the plucker but makes the landscape poor indeed. It is indeed a glorious sight to see a great hillside covered with hundreds of the gigantic creamy-white plumes—there never were too many present for the beauty of the scene.

The only way by which the numbers may be increased is from seeds. But one in a hundred germinate, probably a far less per cent. Every spike of flowers removes from one to many hundreds of seeds. We choose to believe that children and newcomers are largely responsible for this vandalism. It is hard to conceive that adult Californians can be so thoughtless, so destructive of a plant so typically and exclusively Californian, one that lends to our state's reputation as a land of rare beauty and many wonders. If this wanton destruction is pursued at the present rate for but a few years these beautiful yuccas will pass from the commonplace to extreme rarity.—E. B.

COOPERATIVE TRACTOR UNITS

J. A. Dennis of the "Mutual Tractor Unit" at San Dimas, Los Angeles County, thus sums up the advantages to be derived from a cooperative tractor unit under the oversight of careful, efficient men:

A large equipment with a small investment cost per acre.

A low operation cost per acre per unit of operation.

A higher type of work than usually given on small holdings or by commercial tractors.

Elimination of trouble and worry to the individual grower, as to care of outfit.

Insurance of regular, efficient operation of work, without the personal supervision of the grove owner.

Especially adapted to handle the work on groves where the owner is too far away to handle.

ROSE DISEASES

A great deal of damage is annually caused to rose gardens in the island of Trinidad, West Indies, by several diseases. Two of these are very common wherever roses are grown and are due to the fungi Diplocarpon Rosae and Sphaerotheca pannosa. Various fungicides have been used in the control of these diseases, but the best results have been obtained by dusting the plants with a mixture consisting of 1 pound arsenate of lead and 9 pound flowers of sulphur.

What I have learned about Baking Cake

MRS. DE GRAF *enjoys a wide reputation as an authority on home cooking and baking. In this article she discusses a topic that appeals to both the palate and the purse. It is well worth reading — and saving!*

—EDITOR.

CAKE comes on the list of luxuries right now, so the utmost care should be taken both in the method of preparation and in the quality of material used. Good flour is absolutely essential for good results.

Take, for example, Sperry Drifted Snow Flour. It is an "all purpose" family flour—equally satisfactory for yeast breads, biscuits and cakes. It will produce the delicate Angel Cake as well as the standard plain cakes.

The best results and flavor will always be obtained from butter, but because of the high cost at the present time, butter substitutes are being used with satisfactory results. The mixing and baking of cake require both skill and judgment. The baking needs more study and care than the mixing, for no matter how well you have put the cake batter together, if the oven is not right the cake may be a failure.

There are two classes of cakes—those which contain butter or other shortening, and sponge cakes in which the butter is omitted.

The more the cake is beaten before the egg whites are added, the firmer its texture will be. Separating and beating the eggs gives a light, fluffy cake. The eggs can be added to the creamed sugar and shortening mixtures one at a time, unbeaten, but beating each egg vigorously when adding to the batter will produce a cake that is moist and fine grained, and that will keep in good condition for some time.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

The cover gives us a look at Incomparable and her colt. Incomparable is owned by Santa Anita Rancho and is one of the many fine Percherons which are producing workers and breeders to add to the efficiency of California's farms.

* * *

Recently grain dealers, elevator operators and others interested in the purchase of the grains of the farms of the Middle West met in Cincinnati, passed the hat and raised a fund of a quarter of a million dollars, which it is charged is to be used to "actively combat the activities of the U. S. Grain Growers, Inc., and of county agents." Now the U. S. Grain Growers, Inc.," happens to be made up of the great American farmer, and the great American farmer is saying to himself and to everybody else: "I am not going to be farmed any longer than I have to." So it has come to a show down, and a real fight is on between the producers of the grain and the men who in the past have made the profits from the grain.

Manager Tucker of the California Almond Growers Exchange writes in appreciation of the work of the Cultivator in aid of the tariff on almonds. Mr. Tucker adds: "Our battle is not yet over. The importers, who at the present time monopolize the shelled almond market of this country, are waging a terrific fight. We intend to carry the campaign right into the senate, with a view of not losing that which we have gained, but also obtaining the minimum asked by our growers of five cents on unshelled and 15 cents on shelled almonds."

Dr. Mead of the land settlement board announces that a parcel of land at Delhi in Merced County has been divided into 50 poultry ranch allotments, that is, small parcels ranging from two to ten acres and at a valuation of around $200 per acre including the water right. These parcels will be open to allotment about the first of September. This will really mean a great increase in the population of Delhi.

* * *

Tulare County is one of the pomegranate growing centers of the state. The pomegranate is one of the most attractive of fruits and yet seems to fail in commanding great demand in the open market. Now Tulare County papers announce that the juice of the pomegranate has wonderful possibilities as a dye and in making dyes fast.

* * *

Bronte A. Reynolds, for the past two years editor of the publications of the California department of agriculture, has tendered his resignation and accepted a position along similar lines with the Pennsylvania department of agriculture. Mr. Reynolds will leave for the East August 1. W. S. Killingsworth, assistant to Director Hecke, will have charge of the editorial work of the department for the time being.

* * *

We regret that the address on "Liquid Gas, Cyanofumer or Pots—Which Shall It Be?" used on page 75 last week, was not credited as being from "an address by R. S. Woglum before Fumigation and Pest Control School held at Whittier." That school, under direction of the Los Angeles County farm bureau, brought together a vast fund of information which is needed at this time. For more than a third of a century we have been fumigating citrus trees in California and have learned a great deal as to hydrocyanic acid gas and its capabilities, but there are still so many questions confronting the grower, questions yet unsolved and which sometimes seem almost unsolvable, that a gathering of practical and scientific people such as that at Whittier proves of great value.

LAND SETTLEMENT COURSE

Land settlement possibilities, land settlement needs, methods, opportunities for the individual and for the state, and, in fact, land settlement from all angles, is to be discussed in a short course to be held at Berkeley September 5-18. Dr. Mead and other members of the commission have a great fund of information and are filled with enthusiasm as to what state land settlement plans mean for California. But they wish a wider circle of enthusiastic supporters of land settlement plans. They wish for themselves and for these other supporters a greater fund of information made necessary by the problems brought out in the two land settlement schemes already under way, so they have called the Berkeley meeting, or rather arranged for a regular short course covering nearly two weeks, and in those two weeks every angle of California land settlement problems will be discussed.

WHO'S TO BLAME

Dispatch from Darwin J. Smith at Turlock to Sacramento Bee:

"Ten years ago there was one Japanese family in the Turlock district. Today Japanese lease half the cantaloupe acreage there and Japanese labor has replaced that of white hands."

And these few words give one a good start in understanding the "Mob Rule at Turlock," "Japs Deported," "White Farmers Driven to Wall," etc., which have appeared in headlines for the past few days.

The few white farmers remaining are forced to employ the cheapest labor or quit the game. Whether it's I. W. W. disturbers or other labor angered at Orientals taking their jobs matters little. The big problem for California, or rather for the United States, is that a "friendly nation" is violating its "Gentlemen's Agreement"; it is pouring into this country laborers who are depriving white men of jobs, and a race problem must be solved and by some other means than by simply shutting our eyes and everlastingly shouting: "There is no race problem."

GRABBING

The grabbing habit seems to be approaching the epidemic stage. The human race has rather encouraged the habit for many years, and the columns of the California Cultivator have been filled with suggestions that in this great grabbing game there be a reasonable degree of cooperation on the part of the producers of the land that they may stand an even show with great aggregations of capital, often termed "the interests."

Some years ago the citizens of Los Angeles appreciated the necessity of cooperation in securing water. They went 250 miles into the Sierra Nevada and at an expense which has aggregated close to $40,000,000, secured by heavy taxation of the cooperators, brought to the city a great supply of water. Their wisdom is shown by the fact that when this movement was first started there were far less than 200,000 people to be served by the water, while now there are perhaps three-quarters of a million users of that water who also are consumers of California potatoes and other farm products.

One feature of this movement for conservation and use of water was the development of hydro-electric power. Since then producers of the state have been loking to the same mountains and asking as to how other waters could be developed or conserved and used both for power and for watering the land. Engineers of the geological survey, of our state engineering force, and of the large hydro-electric corporations have made investigations. Concerted effort has been made, as in the case of the Marshall plan, and the principal result thus far has been a feverish rush toward the mountains without organization looking to the best interests of the people as a whole.

The Marshall plan could not be sufficiently extensive to protect the interests of all the people of all the state, and yet it was so extensive in scope that many were frightened by its talk of hundreds of millions of dollars required to make it effective, so cooperation has been cast to the winds, and the grab has started. Amongst the first in the effort to secure rights in the mountains to the power which will last forever were the larger hydro-electrics.

Noting the wonderful blessings which had been secured by her former effort Los Angeles has advanced along the same line and endeavored to secure rights alongside of other large corporations. This has been resented, and farmers have been appealed to in the fight against the municipal corporation. One of the reasons given in the opposition to the great city securing this power was that it carried it to the city and sold it at prices under those charged by the hydro-electric companies in the smaller cities. The fight is not confined to the districts south of Tehachapi; it is state wide. In fact, the large company which is securing the support of many farmers south of Tehachapi is being opposed in the courts by farmers of Inyo County. There the irrigators united in defending themselves against the demands of the comany and won complete victory.

As a rule the papers of the state outside of the cities of San Francisco and Los Angeles have made most caustic criticism of Los Angeles' effort to save the power and give it over to the use of the people without dividing the large profits of such a movement with any private interest. However, one paper, the Modesto Herald, calls attention to the wonderful wealth of the mountains and appeals for cooperative effort on the part of the producers and real workers of the state and urges effort to secure by the people and for the people the same advantages, and then adds:

"What Los Angeles has done every county tributary to water and power sites could have done had they had the same foresight and the same 'intestinal fortitude.' To some the opportunity is still open—the Modesto and Turlock irrigation districts are an example. To the state the opportunity is still at hand to save much of the water and power resources of the Sierras for the benefit of the whole people. Will the state do it? Unless other municipalities take action, who should berate Los Angeles for her 'porcine proclivities'?

"The way to checkmate Los Angeles is to get busy profiting by her example."

There is nothing to be gained by calling names and scratching and pulling hair. California needs more cooperative spirit, more getting together and working together. That cannot be secured by following the present movement of trying to stop everybody else from getting what we, the people, are refusing to reach forth and take possession of.

What farmers need is more and cheaper water and power. They may get it through the state; they should see to it that they do get it through cooperation with the state. As we go to press a movement is started to initiate and secure enactment by the people of "A California Water and Power Act." May careful study of it prove its worth, then may we get behind it and push.

Horticultural Commissioner Brosius of Sacramento County says grasshoppers are doing serious damage in several sections.

California Cultivator

Vol. LVII, No. 5 | Los Angeles, July 30, 1921 | One Dollar Yearly

Potato Growers Addressed by Governor Stephens

THE potato growers' section of the Los Angeles County farm bureau is holding a meeting today at Van Nuys in the San Fernando Valley and discussing standardization, especially the (new to California) U. S. standard, and also to an extent cultural methods. San Fernando Valley is becoming one of California's potato producing centers. This session is especially honored by the presence of Governor Stephens. Governor Stephens' address is largely devoted to enactments of the recent legislature which are favorable to agriculture. No other legislature has ever given so much attention to and no other governor ever signed so many enactments favorable to agriculture.

Nearly all of these enactments have been referred to in a series of articles written by R. N. Wilson for Cultivator readers, so we will not quote that portion of the governor's address touching upon the specific laws. In part the governor said:

GOVERNOR STEPHENS

"We are continuously reminded of the gigantic power of the earth to replenish. Nature's storehouse not only contains the grains that overflow the barns, but from it can be drawn, and is continually drawn, the wisdom and the strength that leads to the building of cities, the spanning of the waters, and the triumph of righteous endeavor in war and peace.

"The task has been laid upon us to fructify the land, to make it laugh a harvest, to go on ever struggling to make the world good and better, as was intended by the Creator. He reserved creation for Himself, and gave us re-creation as our God-blessed privilege. That is indeed a privilege, as you who labor in this wondrous garden of nature will testify.

"We have a profound responsibility in the development of this state of California. But it cannot be adequately developed by the placing of bricks, one upon another, nor by merely promoting education and educational institutions. We cannot safeguard it by prohibiting and inhibiting with laws alone. But we can lay the foundation for great and glorious cities, for wide highways that are the arteries of trade, for the institutions of learning, if we labor intelligently and reverently first and always with the problems of the soil. The soil is foundational, and from it emerges all progress, even as has been said in those first beginnings before man realized his heritage and his destiny."

Touching upon California's opportunities, the governor said:

State's Potentiality

"My investigation shows me that the total irrigable acreage of the state for which water can be available is 9,699,600, or close to ten millions of acres. Of this amount, 3,500,000 acres, or 36 per cent, of the total was irrigated in January, 1915. An additional 636,000 acres since the initiation of the water commission act in this state shows the progress we have made, a seven per cent increase, but there remain 5,563,000 acres yet to be put under irrigation for which water can be made available. Applications for irrigation received during the 18 months ending in July, 1920, cover an area of approximately 5,000,000 acres, and the total of all applications at present adds another million acres to this sum.

"The careful analyses of the power possibilities from our mountain streams show that the state can produce 9,250,000 theoretical horse power. At the time that the state organized the water commission there was a total of 910,000 horsepower developed in all this great state. That has been increased by 236,000 horsepower. While this shows that a remarkable program of power development is under way, it also points to the huge potentiality, and it is the potential possibilities of this state with which you and I must deal intelligently. And I shall say to you here today and to every gathering wherever it is appropriate, that I intend to foster this program of potential development in every way that is feasible and just and indicative of sane progress, for there can be no greater project in this marvelous state of possibilities than that of conserving, retaining and applying the unused and wasted water and power of the people for the people.

"As tillers of the soil I know that you must be and are interested in these tremendous projects which your water commission and your governor are engaged in adjudicating. In this semi-arid country there can be little progress in the tilling of the land until the land has been adequately supplied with water, and not only must this water be conserved to the last drop in this scheme of progress, but it must be distributed on an equitable basis. That is the problem of your public officers, a problem in which I ask you to share to the extent of your interest and study and suggestion. You must give your state more power to carry out the projects that have been found to be feasible, and in doing so you will increase the productivity of this state a thousand fold, yes, a thousand thousand fold.

"The defining and clearing up of water right titles for use in irrigation is one of the great tasks confronting California, but it is not an insurmountable task. As your governor I aided in passing and afterwards was glad to sign three bills which have to do with the program to make water titles as clear in this state as land titles. Without water much of our land is worthless for agriculture, and unless water titles are as definite as deeds to land we cannot offer a good investment in those lands to the thousands of future Californians whom I picture in my mind as coming in an ever increasing company to share in the prosperity of this great commonwealth.

"What we desire in this state is intense agriculture. The world cannot afford to allow its lands to be grazed on the old plan of ten acres to the meat animal unless the land utilized for this purpose cannot be reclaimed by the application of water. The American does not want to waste his substance in this manner, and the nation and the state cannot afford to longer continue such a practice.

"Therefore, I am working to the best of my ability to place men and women on the land with opportunity for production actually confronting them. I am deeply anxious to remove that mirage of the desert which has blasted so many fond hopes, which is the dry homestead. The dry homestead belongs to the old and careless and care free days. Today we are confronted by serious conditions, and development depends upon our care in the handling of these conditions.

"Out of this desire to give actual opportunity we have evolved the state land settlement act, which is familiar to most of you, but in brief combines all the essentials of opportunity by placing in the hands of men and women anxious to work them, lands with sufficient amount of water already developed by the state. Following up this step this settlement act provides for the financing to a certain extent of these state homesteaders, the amortization of payments, easy stages of acquiring the lands over a maximum period of 40 years, and the further provision of small allotments to farmer laborers. So far as this act has been in operation it is a splendid success. It is the true way, I believe, of building up the agriculture of this state from out the efforts of people who really wish to succeed and make a home.

For the Soldiers

"And then, finally, I want to speak just briefly of a group of legislative acts pertaining to the soil, which are similar to the state land settlement act, indeed, patterned somewhat after that act—the veterans' welfare act, and the creation of the veterans' welfare board. No legislation has been closer to my heart than this legislation, which I had the profound satisfaction of urging and eventually signing.

"In order to make this great program of soldier legislation a reality, the people are asked under another act to vote ten millions in bonds one year from next November at the general election. This money will go into a revolving fund which, as the soldiers pay off their indebtedness, will be returned to the state treasury."

Early Tractor Owners Still Use Mechanical Power

OF MORE than 1,200 farmers in the corn belt and northern great plains states who purchased tractors four or more years ago 81 per cent still use their first machines or others which they have since purchased. Nearly half of those who have bought their second machines have changed their opinions as to the best size for their purposes, as indicated by the sizes of the machines purchased. The men who had sold their first machines kept them for an average period of a little more than three years and sold them for an average of $490, approximately half the first cost.

These facts are brought out by the replies to several thousand letters sent out by the bureau of public roads to tractor owners in North Dakota, South Dakota, Nebraska, Kansas, Minnesota, Iowa, Missouri, Wisconsin, Illinois, Indiana, Michigan and Ohio who had furnished reports on their machines in 1917 and 1918.

A summary of the replies from 1,219 men who are still operating the same farms or similar farms in the same locality showed that in 1920, 534, or 44 per cent, still owned their first machines and used them for field work; 446, or 37 per cent, had replaced their old tractors with new ones which were used for field work; and 239, or 19 per cent, did not use tractors for field work. Seventy-one of the 239 still used their old tractors for belt work.

About one-half of the machines purchased in 1916 and 1917, one-third of those purchased in 1914 and 1915, and one-fourth of those purchased in 1913 or earlier, were still being used for field work. Of 808 men who purchased their machines in 1916 and 1917, 410 still owned the same machines and used them for field work; 25 of them had purchased other tractors and used both for field work; 275 had replaced their old tractors with new ones which they used for field work; of these, 227 had sold their first tractors and 48 still had them; 13 of the latter used their old tractors for belt work only, and 35 did not use them at all; 123 did not use tractors for field work; of these, 123 had disposed of their tractors, 35 used them for belt work only, and 21 still owned the old tractors but used them for neither field nor belt work.

Of 331 men who purchased their machines in 1914 and 1915, 105 still owned and used them for field work in 1920; of this number, 105 had purchased other tractors and used both for field work; 133 had replaced their old tractors with new ones which they used for field work; of these, 99 had disposed of their first tractors and 34 still had them; of the latter group 10 used their old tractors for belt work only and 24 did not use them at all; 93 did not use tractors for field work, 46 of whom had disposed of their trac-

(Continued on Page 114.)

Agricultural News Notes of the Pacific Coast

Northern California

The Sebastopol apple district reports about two-thirds crop of Gravensteins.

The Point Reyes cow testing unit of Marin County has employed a new tester.

In the first week of July San Francisco shipped 35,800 dozen eggs to Hawaii.

Alameda County farmers have decided to establish a free market in Oakland.

Deciduous fruit shipments are almost twice what they were last year at same date.

Sutter County supervisors have awarded contract for building the long bridge over Butte Slough.

The Eden Township Fair to be held at Hayward is expected to show exhibit of over 1,500 pigeons.

The Knightsen and Lone Tree farm centers of Contra Costa County are planning erection of center club houses.

The Poultry Producers of Central California reports production of eggs during May as only two per cent less than in April.

Poultrymen of northern Sacramento Valley are making a net profit of $1.25 to $2 a hen, according to the Petaluma Poultry Journal.

California Almond Growers Association is enlisting all the agricultural interests in the state in the fight for increased tariff on its product.

Several suits have been filed by the supervisors of Glenn County to enjoin rice growers from allowing waste water to overflow county roads.

Napa County supervisors have awarded contracts for construction of three miles of paved highway from Braggs Hill to the foot of Napa Mountains.

The supervisors of Sutter County have given up consideration for the present of construction of bridge across the Sacramento River at Grimes.

Dairymen of the Galt farm center of Sacramento County hold a big meeting tonight to which milk producers from the Franklin, Consumnes, Sacramento and San Joaquin districts are invited.

The berry crop of the Paradise Ridge in Butte County is about 75 per cent of normal. Fruits generally are giving light crop but heavier than at first estimated. Grapes are yielding large tonnage.

A stringent quarantine was issued July 5 against materials which may introduce alfalfa weevil from infested territory in Utah, Idaho, Wyoming and certain counties of Colorado, Nevada and Oregon.

The Sacramento County farm bureau and the Sacramento city and county chambers of commerce are putting their heads together to evolve some kind of a market plan that will give justice to the small grower.

Peach growers of Sutter County are shipping their clings to the plant of the Virden Packing Company at Emeryville where they will pack on a cooperative basis. This action is said to have induced canners to raise their offer from $35 to $38 per ton.

Central California

Modesto milk price delivered, 12 cents per quart beginning July 1.

Work is progressing rapidly on preliminary work on the Don Pedro dam.

Visalia peach growers are protesting the $35 a ton price offered by canners.

Over 1,300 cows were tested by the Stanislaus County association during the month of June.

Fires in the Sequoia national forest have been brought under control after burning over 3,000 acres.

The Nevada-California road club is making repairs on the Mt. Montgomery road between Tonopah and Bishop.

The farm home department of the San Joaquin County farm bureau will take active part in the county fair.

Grasshoppers are reported as doing serious damage to young orchard trees in the Gilroy district of Santa Clara County.

The Livingston farm center of Merced County is planning a basket picnic on the river the last Saturday in July.

Farm home department meetings in Kern County at Weed Patch, July 19; Inyokern, 22; Kern Delta, 26, Wasco, 28; Edison-Fairfax, 29.

Twelve thousand people attended the Tulare County picnic at Mooney Park, July 7. Actual count showed that 2,400 automobiles entered the park.

Inyo County farm centers are planning a county fair at Bishop the latter part of September. Other organizations are taking up the project.

Prizes of $50, $30 and $20 are offered by the management of the Patterson fair for the best exhibit of any farm center of Stanislaus County.

Poultry Specialist Easson will begin a series of poultry demonstrations in San Joaquin County, August 19, at the home of Mrs. J. C. Baker, near Ripon.

Farm bureau meetings will be held in Kern County at Mountain View, July 18; Pond, 20; Inyokern, 21; Rosedale, 22; Shafter, 27; Arvin, 29; directors, 30.

The California Cooperative Canneries has received a loan of $2,000,000 through the war finance board. The company operates canneries at San Jose, Modesto, Visalia and Tulare.

Farm bureau meetings for San Joaquin County are scheduled for Acampo, August 2; Ripon, 3; Nile Garden, 5; directors, Stockton, 6; joint directors, Galt, 13; Escalon, 15; Summer Home, 18; Lathrop, 22; Calla, 26.

The Fruit News says: "A survey of the situation in canning activities in Santa Clara Valley shows about one-third of the canneries idle; one-third working on quarter time; the other third at about half the usual pack.

Farm home department meetings will be held in San Joaquin County at Farmington, August 2; Bruella, 4; Manteca, 5; French Camp, 9; Douglas, 10; Escalon, 12; Linden, 16; Ripon, 17; Summer Home, 19; Lafayette, 24.

The veal calf department of the Tri-County Marketing Exchange has headquarters at Modesto. Calves are shipped the first four days of the week, leaving Modesto by truck at 4 a. m., reaching the Bay cities before the heat of the day.

Southern California

Riverside is now getting 13 cent milk.

Avocado association field meet at Puente today, July 30.

Pupils of the Banning Indian school are cutting apricots at Banning.

Orange County fair will be held at Huntington Beach, September 28-October 1.

Carpinteria Valley reports beans making sturdy growth in spite of their late start.

The annual Iowa picnic will be held at Bixby Park, Long Beach, all day, August 13.

The Orange County farm bureau is considering advisability of appointing a secretary-manager.

The drop of oranges was not as serious as in former years and promise now is for a large crop.

Shipments of white potatoes from Southern California are some 500 cars heavier than last season.

A new correspondence course in walnut culture is being prepared by the state college of agriculture.

Santa Barbara County is considering purchase of a 1,000 acre tract around Nojaqui Falls to be set apart as a park.

Brawley, Imperial County, has finished cantaloupe shipments. Honeydews and watermelons are now going forward.

The acreage of chili peppers in the Garden Grove district of Orange County is reported fully 35 per cent under last year's.

Representatives of farm bureaus of the San Gabriel Valley spent two days last week inspecting site of the San Gabriel dam.

Strikers in Orange County packing houses have returned to work at the same wages, 5½ cents per box for packing oranges.

Walnuts will be smaller than last year and probably about 10 days earlier harvesting. The total production will be about 40,000,000 pounds.

The Santa Ana Sugar Company's plant at Dyer will start slicing beets August 1. Huntington Beach factory will probably start the same day.

The California Peach and Fig Growers Association has named opening prices on a basis of about nine cents on peaches, seven to nine cents on figs.

The walnut output will be far below normal. The crop is exceptionally spotted; some sections show loss of 100 per cent, while others are even above normal.

Contract prices to growers on chili peppers are still under 15 cents, but it is hoped they will go higher before picking time. Last year's beginning price was 20 cents.

The California Honey Producers Cooperative Exchange has moved into new quarters at 1275 East Sixth Street, Los Angeles, where storage accommodations are available.

Plant No. 20 of the California Prune and Apricot Growers, at Santa Paula, has just closed its pit cracking season after a run of nearly three months. The 1921 crop will soon be coming in.

The Coast and General

The Washington state fair will be held at Yakima, September 19-24.

The Farmers Finance Corporation is the fiscal department of the U. S. Grain Growers, Inc.

The Arizona Cattle Growers Association held its summer meeting at Flagstaff July 8 and 9.

Chas. B. Fowler, former sheriff of Santa Cruz County, Arizona, has been appointed collector of the port of Nogales.

Inspection of Arizona milk for the month of June indicates that the general quality of milk over the state is improving.

Receipts of the state land department of Arizona for the six months ending June 30 totaled more than a quarter million dollars.

Salaries of livestock inspectors in Arizona have been reduced 20 per cent. This is due largely to the fact that few cattle are being shipped at the present time.

Oregon's apple crop will be larger than last year, according to estimate of Statistician Kent of the U. S. bureau of markets; Hood River about the same as last year; Rogue River, 25 per cent increase.

About ten per cent of the cows in the Pima County, Arizona, cow testing association produced 40 pounds or more of butter fat in June. The highest production reported was 73.9 pounds of butter fat.

Cantaloupe shipments from the Salt River Valley of Arizona have not been quite so heavy as at first anticipated, but the quality is said to be unusually good, and generally Arizona cantaloupes have topped the markets in the east.

Fire destroyed two stacks of grain for a Salt River Valley, Arizona, farmer the first of the month, one stack contained the grain from 80 acres of oats and the other the grain from 20 acres of barley. Evidence points to incendiarism.

The number of farms in the United States on January 1, 1920, was 6,448,366. Of these, 261,553, or 4.1 per cent, were operated by women. Texas has the largest number of women farmers, 16,128. California has 5,774, of whom 5,406 own the farms they are operating.

Representatives of 12 state public utilities commissions met in Chicago, July 20, to outline evidence to be presented before the interstate commerce commission looking toward a reduction of railroad rates for grain, grain products and hay. A committee was appointed to appear before Commissioner E. I. Lewis in Washington on August 15.

Estimates of the bureau of markets and crop estimates July 9 indicate a crop of 35,000 bales of Pima cotton and 12,000 bales short staple for Arizona this present season. Other crops are: Wheat, 958,000 bushels; barley, 860,000 bushels; corn, 754,000 bushels; grain sorghums, 1,415,000 bushels; oats, 777,000 bushels; beans, 70,000 bushels; potatoes, 464,000 bushels; and hay, 422,000 tons. This is an increase in all crops except cotton which will show a considerable decrease.

Humus

By C. A. Nidever

MANY farmers do not fully appreciate the value of humus. If there were such a thing as a cure-all for the soil it would be humus. There may be locked up in the soil all the minerals necessary for plant growth, but on account of the lack of humus the soil is dead, run out, farmed to death, or any other of the various names given to that type of soil with which every farmer is familiar.

The great lack of most soils is not mineral matter, as most soils contain all of the mineral matter needed. The trouble lies in the fact that the minerals are not available for plant life. Nature was generous in supplying California soils with minerals, and the amount consumed by plants is relatively small.

A graphic showing of the amount of mineral in vegetable matter is secured by burning a quantity of leaves or grass and noting small amount of ash left. The ash represents the mineral matter.

Humus is nature's laboratory wherein the mineral and other potential plant food is worked over by the soil bacteria and made available for the plants to digest.

Humus is organic matter in the soil, such as decayed vegetation and animal manures of different kinds.

In studying the history of plant life we find that plants have survived because they have adapted themselves to conditions as they are in their natural state. In this natural state the leaves, roots and grasses were mixed with the soil and decayed, thereby forming rich humus for the succeeding generations of plants. Decayed vegetation is nature's way of keeping the soil in fertility.

In most cases new land is rich with humus, and under cultivation we must follow these laws of nature by adding organic matter if we expect to keep the soil fertile. In applying our knowledge of the natural state of the plant to farming conditions we must remember that all of the vegetable matter went back into the soil, while under cultivation most of this vegetable matter is taken off as crops. Year after year of robbing the soil of its natural means of keeping its fertility will result in stunted vegetation and loss of revenue. When vegetation is put back into the soil it decays and forms humus.

It is this decayed vegetation mixed with the soil that increases water holding capacity. Soil moisture serves not only as food for the tree or plant, but creates conditions favorable to work of soil bacteria in adding nitrogen and changing mineral elements from an unavailable to an available form for plant food. Most soil bacteria are dormant when the ground is dry.

In the natural state practically no green vegetation is put back into the soil. The leaves that fall and make mould and the dead grasses and roots are always dry matter. Reasoning it out from that standpoint the best form of organic matter to make humus is dry material. It is the tough, fibrous part of the dry vegetation that has the capacity of holding moisture. Dig out a cornstalk that has been plowed under and see how it has stored up and held the moisture. This water holding capacity continues after the fiber has decayed and forms part of the soil.

In observing a field that had been farmed to grain for over 30 years, it was seen that a heavy crop always grew under a large white oak tree that stood in the field. The rest of the grain was small and thin. The leaves that dropped from this tree were sufficient to keep the land fertile and raise a crop every year. There was a distinct line showing how far down the slope the leaves had been carried on the lower side of the tree.

Barley Used as Cover Crop

Paso Robles high school agricultural students studying soil management in a local orchard.

Where it is practical to do so, dry matter should always be put on as a humus builder. One objection to putting on dry material is its slowness to decay. Great care must be used in not getting on too much at a time. Where irrigation is practiced more can be rotted than in an unirrigated section. All should be put on that can be handled with the water that is available. Each farmer's field is his own problem. He knows best how much moisture he has to work with and can act accordingly. The legumes make the best humus builders, but any of the grain straws are good. Where livestock is kept it is a good plan to stack grain straw in the yards where the stock can have access to it all winter. In feeding much of the straw is scattered and rotted, while the animal manure is mixed into it. A year's supply of dressing, which is partially rotted, can be kept ahead in this manner, thereby allowing more to be put on the land at a time. There is a straw spreader attachment that fits on a manure spreader wagon that will save time in spreading and make a more uniform dressing.

Where animal manure is obtainable it ranks among the best humus builders. It contains much available plant food that vegetation has not. It is in itself organic matter partially broken down by animal digestion and incorporates with the soil rapidly, making a very favorable condition for the soil bacteria to work in.

Green Manures

Where it is not practical to give a dressing of dry matter a cover crop should be used. The legumes are the best but any vegetation is good. As to amount to plow under, the same rule holds as to dry matter—all that can be well rotted with the moisture that is available. On irrigated lands with plenty of water the cover crop can be allowed to get more mature, thereby increasing its value as a humus builder. Under irrigation it is a good plan to start the cover crop early in the fall before cold weather begins, which gives a longer growing season. In California districts depending on rainfall all vegetation should be turned under not later than March.

The building up of the soil should be part of the yearly work, the same as plowing and harvesting. No soil will continue to be profitable if cropped every year without some return to keep up its fertility. Fertilizing is not a big problem. Nearly every farmer has cheap material that will make first class humus builders close at hand. The idea of fertilizing is not necessarily to put in this or that mineral, but to build up a porous, friable, live soil. With proper cultivation such a soil will hold moisture and the soil bacteria will develop and do their work.

In brief, cultivate soil bacteria and the plant or tree will take care of itself.

The Way of the Farmer-Breeder

By R. P. Royce

THE idea seems to exist in the minds of many that the ownership of well bred livestock is for the man of means rather than the man in moderate circumstances. Doubtless that impression is gained through the publicity given the more spectacular performances and accomplishments recorded in the activities of the different breeds. As a matter of fact, notwithstanding that many wealthy men have been attracted to the business of producing pure bred livestock and many such men have rendered most valuable contributions to the upbuilding of the breeds, the real ownership and destiny of the improved breeds remains, as always, in the hands of the more progressive farmer-stockmen.

Scarcely a week goes by or a show is recorded, that does not disclose some marked accomplishment on the part of a man who might be regarded as a small operator. It is also true that investigation of the history of men who have come to be regarded as leaders in the livestock world shows that they are in reality but "small breeders grown large."

Authentic instances to substantiate the contention that no monopoly exists in the production of the highest type livestock are not difficult to cite. Take, for example, the development of the new world champion Holstein, Bella Pontiac. Bella Pontiac was purchased as a three year old at public auction by Thomas A. Barron, a 28 year old Canadian farmer. The price paid was $170 and it is recorded that the purchase price took about all the spare money Barron had. Can there be doubt but that there are many men owning Holsteins who are able and would be willing to spend thousands to accomplish what this young man has done with a very modest investment?

It is not necessary to go out of California to find other examples almost as interesting. From one end of the state to the other there are dozens of modest, hard working dairymen-farmers who are continually "putting one over" on their wealthy contemporaries. The most distinguished breeding establishment in California has been developed by A. W. Morris and Sons of Woodland, men who have reached the pinnacle of Holstein achievement from a start as tenant farmers and grade cow owners. Call the roll of California Holstein breeders and it will be found that the majority of the best herds are owned by men who made modest beginnings and who depend on their cows for their yearly income.

Inquire into the Jersey situation in California and it will be found that 90 per cent of the best Jerseys have been developed and are owned by men who are practical dairymen. Every Jersey champion at Sacramento for the past several years has been owned by men of comparatively small means.

The Guernsey affairs are following the trend of the other breeds.

As the beef breeds expand in this state we will record similar achievements from small collections.

With very few exceptions the different breeds of swine in California are in the hands of men who are living on their own farms, doing most of their own feeding and developing.

In Oregon, where the Jersey breed has made such a sensational record as to entitle that state to be placed in the front rank, investigation will show that 95 per cent of the notable herds are in the hands of farmer-breeders.

Rather than working under a handicap as compared with the wealthy owners, the man who is depending on his herd for a living and whose entire interest is centered in the care and development of his herd has certain definite advantages over the fancier.

The small operator by force of circumstances is compelled to be in constant contact with his herd. He has ample time and opportunity to study the individuals making up his herd, whereas the man whose breeding operations are but a hobby misses that close acquaintance and understanding

(Continued on Page 111.)

Problems of Southwestern Alfalfa Shippers

THE irrigated areas of the southwestern United States can produce a high market grade of alfalfa hay, but there are several difficult problems that must be solved in order profitably to market the hay, say specialists of the bureau of markets, United States department of agriculture.

Method of Baling

The first step which has a direct bearing upon the marketing of alfalfa is baling. The rainfall in the Southwest is exceedingly light during the hay making season, and for this reason much of the hay is baled out of the windrow or cock.

When hay is baled from the windrow in sufficiently green state to save all the leaves it can not be pressed tightly because of the danger of heating, and shippers therefore frequently experience considerable difficulty in loading cars with the minimum weight for which they pay charges. Hay which has been stacked and allowed to dry can be baled more compactly, but in baling stack hay many of the leaves shatter because of the dryness. According to the application by many inspectors of the present grade rules this hay is of a lower grade than when the leaves cling to the stems, notwithstanding the fact that the leaves may be contained in the bale.

Bleached Hay and Weeds

Bleached hay, together with weeds, causes considerable trouble in marketing alfalfa. It is well known that alfalfa hay bleaches quickly when exposed to bright sunlight, but there is a wide difference of opinion as to just the amount of nutrient that is lost in bleaching.

Commercial grade rules, however, are based in part upon this factor. Producers and shippers in these sections contend that too much weight is given the color factor in the present commercial grades for alfalfa and not sufficient weight to its feeding value.

From investigations recently made by the bureau of markets it appears that when the present grading rules are rigidly and technically applied, as is frequently the case on declining markets, it is impossible under the most ideal conditions to produce "choice" grade alfalfa.

The presence of a weed, a blade of grass or of a bleached stem will prevent a bale from grading "choice" and it is practically impossible to obtain hay which is entirely clear of any of these things. Considerable hay is bought and sold on this grade, however, but the use of it, and sometimes also of the grade No. 1, causes the shipper a heavy loss.

The specialists believe that commercial grades for any kind of hay should be made so that physical limitations in production and preparation will be properly recognized, and that such grades should be uniformly applied, and not influenced whatever by the state of the market.

You're Right—

It's the Spray That Does the Work

Southern California no longer needs to experiment with unproved sprays. Fumigation that doesn't get results is denied further credit. Success in combating citricola, black scale and red spiders is best assured by spraying with Balfour, Guthrie & Company materials. Field tests have proved this —let us prove it to YOU.

We will work shoulder to shoulder with Southern California orchardists. We will tackle YOUR problems. Our experts will demonstrate that the right way for you to secure a full harvest of fancy fruit is by spraying now with

B. T. S. 15 pounds	Per	B. T. S. 10 to 12 pounds
TRIUMPH 1½ to 2½ gallons	200 Gallon	TRIUMPH 1 gallon
GLUE 1 pound	Tank	GLUE 1 pound
(For citricola and black scale)		(For red spiders)

(Patented Formulas)

Years of constant research and actual field work in California have proved the unchallenged merit of these sprays. They assure you best results at half the cost of fumigation. You can depend upon more fancy fruit to sell at highest prices.

Write or call at our headquarters in the H. W. Hellman Building, Los Angeles. Frank B. Herbert, assistant entomologist and his aides will examine your grove free of charge. They will tell you the right spray to use and how to use it. To get best results, spray today.

Send at once for your FREE copy of a new bulletin on citrus spraying by our expert entomologist, Paul R. Jones

LIME AND FERTILITY

The following is the summary and conclusions of experiments conducted by Messrs. J. W. Paterson, B.Sc., Ph.D., and P. Scott, chemist for agriculture (Victoria), regarding the relation of lime to soil fertility:

1. Lime tends to leave the surface soil through various channels, and fresh applications become necessary to maintain fertility.
2. Carbonate of lime is the best form of lime for the soil.
3. Burnt and slaked lime are rapidly changed to carbonate when they are applied to land.
4. The rate at which lime acts depends on its fineness of division.
5. Lime, but especially hot lime, has a good effect upon the mechanical condition of stiff clays.
6. Gypsum also coagulates clay, but it has not the beneficial action of lime in other directions.
7. Lime greatly hastens the production of nitrates.
8. It has a good effect in liberating potash and phosphoric acid, especially when the later is combined with iron or alumina.
9. Where required by soil, lime produces larger crops.
10. It produces root crops, which are of greater feeding value.
11. It may often be a profitable application to grass land.
12. Lime kills sorrel, docks, and other acid loving weeds.
13. It is specially stimulating to lucerne, clovers and leguminous plants.
14. Lime will not act if phosphates are deficient.
15. It increases the need, everywhere present, of plowing in green manure or stubbles.
16. It facilitates this operation.
17. The surest method of determining the need for lime is to dress trial strips and await results.—Fruit World of Australasia.

POISONED BEET PULP FOR GRASSHOPPERS

A new use for dried molasses pulp, as a substitute for bran in a poison mixture for grasshoppers, is reported from the Sterling, Colorado, district.

As with many other innovations by farmers this season, economy was the father of the idea. The dried beet pulp was cheaper than the bran. The farmers who were fighting the hoppers discovered that the dried pulp absorbed and held moisture better than the bran and that the hoppers liked the pulp better. As the pulp went farther and was cheaper than the bran the experiment was considered a success, and under similar circumstances the farmers will use the dried molasses beet pulp instead of the bran in the future.

The pulp was used in the same proportions as the bran in the regular poison mixture recommended by the state entomologist at the agricultural college, for use against grasshoppers. But the pulp, dried and sprinkled with molasses at a Great Western Sugar company factory, cost only one dollar a hundred pounds, against bran at $1.20 a hundredweight on the Sterling market. The hopper invasion was stopped.

GARDEN AVOCADOS

Over all the world are gardens of great interest and in no country or part of a country is this more true than of California, especially in the way of fruits. This state fairly teems with home grounds containing fruits in abundance that stretch over the longest possible season. In the colder parts this season is about two-thirds of the year. In the warmer parts it is never ending.

Into one of the latter class the writer recently wandered. It is situated at Hollywood, in Los Angeles City, and belongs to Mr. and Mrs. E. E. Hamilton. Trees here of various kinds are budded or grafted, that is, "topworked" to every kind and variety possible. Both Mr. and Mrs. Hamilton bud and graft, but he says: "My wife is the better workman; women are more careful than men, so she does most of the budding. The later grafting is mine." The number of varieties of avocados represented in parts of trees are many, but the trees are 18 in number, one of each leading variety common in the markets. One seedling, Isabella, named for a granddaughter, is new to the public but may yet become common. Mr. Hamilton has found out, as have many others, that one must not judge of an avocado in its first year of fruiting. This seedling first bore when several years old. Its fruit was "not much." It was decided to topwork it. Much of it was cut away and the stubs budded or grafted. The seedling fruits next year were larger and better. This last year improvement continued, and now it is "Isabella." This is the history of nearly all seedlings; the fruits improve with age of tree. Do not condemn the arboreal youth.

Several cherimoyas planted from seeds of high class fruit have given satisfaction. Named varieties of feijoas, or Paraguay guavas, are mingled with numbered jujubes of varieties distributed by the agricultural department at Washington. There are also eugenias and a considerable number of other tropical fruits, Queensland and other nuts, with citrus, stone fruits and all that go to make up a full home supply. Such home gardens should everywhere abound. Pay no attention to distances; tractors nor horses nor gang plows ever reach such cherished spots. Stick in trees thickly, taking care to have the larger to the north of the smaller, so all may have sunshine. You may soon have a miniature garden of paradise, without danger of being driven out if you partake of the fruits thereof.—E. B.

ORNAMENTAL AND ECONOMIC

A flowering broom has been grown and sold in California for a dozen years as Genista palmensis. While used as an ornamental, in its native Canary Islands it is considered only as a stock food. It is a small shrub of weakly, pendulous habit, few leaves and an abundance of white flowers. From Teneriffe, Canary Islands, comes this description: "This is a splendid forage plant and very drouth resistant. Horses and cattle have to learn to eat it but relish it ever after. In the Island of Palma, where it is native, it has been used from time immemorial and with the greatest success. It is quite as nutritious as alfalfa and does not require irrigation. I know of nothing that will fatten cattle and horses so much." While it has been listed as Cytisus palmensis and Cytisus profliferus palmensis, its correct name is Cytisus filipes. It is not a genista.

MONOTONOUS GREENSWARD

In cities especially, where fashion dictates more than in rural districts, we find block after block and mile upon mile of open, plain, unadorned lawn, all tamely uninteresting, but far better than some aberrant treatment occasionally given by an eccentric owner. Yet when one comes to a real front yard garden properly treated it is so interesting, so attractive, that we realize at once and without meditation that the monotonous stretches of "fashionable" greensward are quite insufficient, far from satisfying or attracting! One passes by miles of them without even noting their presence. Moral: Grow rather than mow.

OBJECTIONS TO INJECTIONS

We have always rebelled at serious consideration of introducing "dope" of any kind into the sap circulation of trees for any purpose whatsoever. But now comes Dr. M. Calvino, director of the agricultural station at Santiago de las Vegas, Cuba, and former director of the Central Agricultural Station of Mexico, with a published account of experiments carried out at intervals since 1912, that appear to have greatly benefited fruit trees through heavy injections of chemical fertilizers in solution.

Two old pear trees were chosen in 1912 that had always blossomed but had never borne fruit. One was treated, the other left for a check. A hole was bored in the trunk a little above the ground, and deep enough to go through the sap wood. Into this was introduced a glass tube so sealed on the outside or around it that no leaks could occur. To this glass tube was connected a rubber tube which was attached to a vessel five or six feet above the ground and which contained the liquid. This nutrient solution was composed of about four gallons of water in which had been dissolved about two-thirds ounce sulphate of iron and one-third ounce nitrate of soda. (Five gallons of water with an ounce of the iron and a half ounce of soda would be simpler.—Ed.) The tree absorbed the four gallons in three days. "The following month the leaves were larger and brighter in color than those of the untreated trees about it, numerous fruits set and developed well, while the untreated trees bore none."

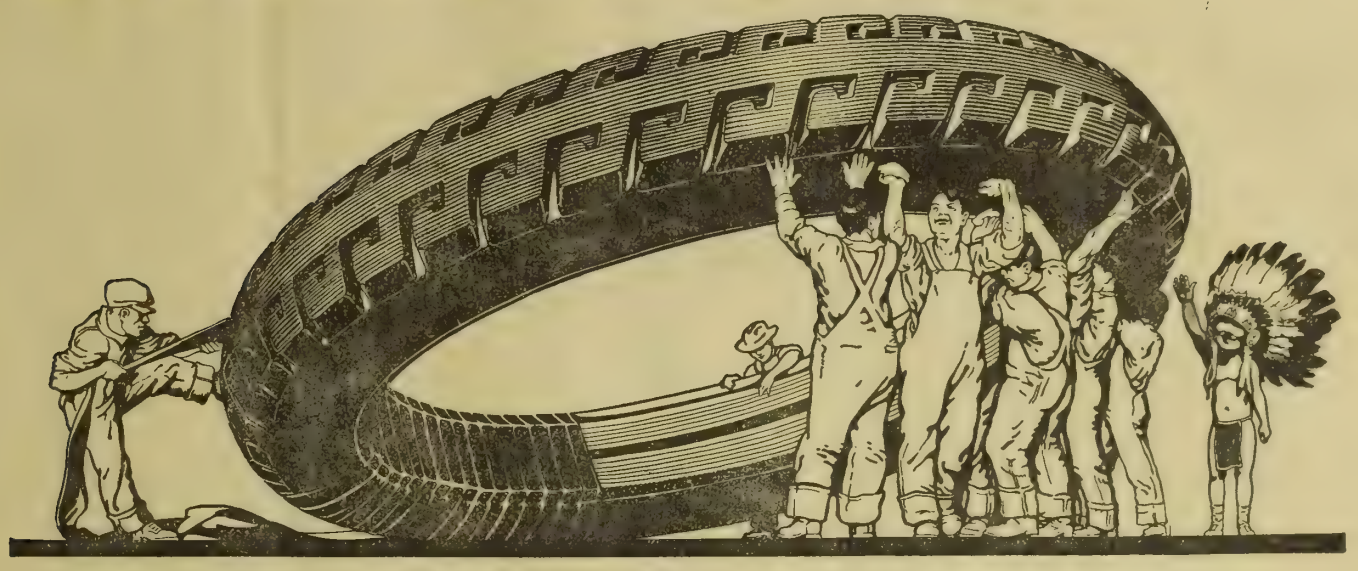
"In 1913 the writer made another experiment on a sterile pear tree. He used: water 20 liters (about four and a half gallons) and five grams (about one-sixth ounce) of each of the following: superphosphate, sulphate of potash, nitrate of soda, and sulphate of iron. The tree absorbed more than 50 liters (about 11 gallons) of this solution just before flowering. It flowered profusely and bore fruit. A lilac was treated in the same manner and produced a larger number of finer flowers."

CONTRABAND COTTON FROM JAPAN

State quarantine officers have found cheap imitation baseballs "stuffed" with "cotton seed hulls." These baseballs, manufactured in Japan, are being sold through Japanese merchants in Bakersfield.

Cottonseed huls are contraband, being proscribed by both the federal and California law, due to the great danger of carrying the eggs, worms, or adults of the dreaded boll weevil or the pink bollworm. In the case of the "baseballs" the eggs of either of these destructive pests could easily be introduced and cause untold losses to the cotton industry of the state.

THE NEW SAVAGE CORD



A BIG, HUSKY TIRE

FOR THE FARM

Nowhere is a good tire, a dependable tire, an economical tire, a wiser investment than on the farm. The practical farmer of today realizes that he needs the best tires on the market.

You will naturally expect unusual performance from Savage Cords, and will get it. The mighty Savage Cord has the strength for resisting severe wear and tear of country usage.

BECAUSE

There are very good reasons for this—

Greater strength is built into them by using only the very best materials and providing from one to two more plies of cords than is the general practice in most makes of tires.

WEAR-RESISTING

The Savage Cord Tread is ideal—it is non-skid, firmly grips the road, delivers the engine's full power without loss of speed. It is tough and wear-resisting.

The Savage Cord has a bead that holds the tire firmly to the rim, preventing rim cutting, tube pinching and other common troubles.

EXTRA THICK

The side walls are extra thick so that rut wear will not destroy the tire prematurely on rough roads.

And Savage Cords are handsome. This attractive appearance is not incidental; it is an outward expression of inbuilt quality.

SAVAGE CORDS

give unusual service because unusual materials and methods are used in their construction. Hand built to the smallest detail, they carry two extra plies of special fabric, absolutely pure gum friction cushion and side stock, and a tough, elastic tread.

We guarantee that not an ounce of shoddy or adulterants is used in either casing or tube.

The mighty Savage Cord is more than a big, husky tire. It is better than a merely good tire. It is greater than a tough tire. It is finer than only a handsome tire. It is Built to Excel and embodies all of these. It is considered by many experts the foremost tire in the Cord Tire world.

Protect Walnuts

THAT Bret Harte was right when he declared, "We are ruined by Chinese cheap labor," is indicated by the fact that the Orient is selling walnut meats in New York and San Francisco for exactly the cost of shelling and packing them in Southern California.

This vital point is brought out by Carlyle Thorpe, general manager of the California Walnut Growers Association, in backing his protest against the walnut tariff established by the ways and means committee in the Fordney emergency tariff bill. Mr. Thorpe contends that unless the bill is amended in such a way as to afford the walnut growers of this state adequate protection from foreign competition the $100,000,000 walnut industry of California will face destruction.

As established in the Fordney bill, the tariff for shelled walnuts would be five cents per pound, with two and one-half cents tariff on unshelled walnuts. This tariff, Mr. Thorpe insists, is not sufficient to offset the advantage enjoyed by Orientals and Europeans in the matter of producing walnuts. In Southern California walnuts are intensely cultivated on valuable land. In China, Manchuria, Italy and France they grow on hillsides, in back yards or along roadsides. The cost of harvesting them in the Far East is ridiculously low.

According to economists who have made a study of foreign labor conditions, most of the nut meats which are shipped to this country are handled by decrepit old men and women who crack and sort them for less than two cents per pound. California laws require that women in the walnut by-product factories be paid $16 per week. This runs the cost of sorting and packing up to 20 cents per pound, which Mr. Thorpe says is the price at which foreign meats are now being sold here.

In discussing the tariff for citrus fruits the ways and means committee recently took into serious consideration the advantage enjoyed by Italian and Sicilian competitors who are able to cultivate, harvest and pack their crops for an insignificant part of the cost of producing oranges and lemons in this country. Experts on tariff were agreed that the only fair basis upon which to establish the new tariff was one which would offset the differential in cost of production.

"If that principle were applied by the ways and means committee to the walnut business, California would undoubtedly be given a tariff of four cents per pound on unshelled and 12 to 15 cents per pound on shelled walnuts," says Mr. Thorpe. "The tariff proposed in the Fordney bill, when we deduct the cent a pound increase in freight rates, is even less than the old Payne-Aldrich tariff bill allowed the California walnut industry."

The ridiculous features of the Fordney bill are pointed out by Mr. Thorpe, who calls attention to the fact that a tariff of three cents per pound is placed upon unshelled peanuts while walnuts are only given a tariff of two and one-half cents. This, despite the fact that 38,829,395 pounds of foreign walnuts came into the United States in 1920. This is dangerously close to the total tonnage produced by California.

"It must be taken into consideration by our congressmen and senators," says Mr. Thorpe, "that the California walnut industry has been doubling itself every four years for 12 years, and that if foreign competition is allowed to continue without proper regulation the California industry will soon be throttled. If the Fordney bill, with its low tariff on walnuts, should be adopted by the senate, and the California industry should increase in the next four years as it has in the last four years, it is altogether likely that the California crop will be a drug on the market, dammed up in the warehouse while floods of cheap European and Asiatic walnuts are glutting the markets."

Speaking of comparative costs of production, Mr. Thorpe says that the labor cost alone is 9.73 cents to produce a pound of walnuts in California, while France grows them for 2.43 cents, Italy for 1.08 cents and China for .53 cent per pound.

Telegrams protesting against the walnut tariff in the Fordney bill are being sent from Southern California by thousands. All of the local associations in the California Walnut Growers Association are wiring Senators Shortridge and Johnson and Congressmen Osborne, Swing, Lineberger and Free to exert every effort in securing a satisfactory amendment of the measure. Many chambers of commerce are adding their voices to the storm of protest against inadequate tariff for California's second largest horticultural industry. Mr. Thorpe urges everyone to telegraph his congressman or senator to insist upon a more suitable tariff for California walnuts.

WINDBREAKS WOULD HAVE SAVED LOSSES

By G. H. Hecke, Director of Agriculture

Aside from the labor involved, the planting of windbreaks is inexpensive when compared with the vast and needless losses suffered through wind and fire.

The California department of agriculture and the California forestry commission stand ready and willing to aid any community, fruit grower or cattle man with advice and suggestions as to varieties of quick growing trees for windbreaks, planting and maintenance.

Lack of Windbreaks Expensive

With an approximate damage to fruit, range and communities through fire and wind since June 25 of over ten millions of dollars, it is safe to assume that fully one-half of this vast loss to the state might have been saved through the moderating effect of windbreaks.

Confronted with the costly experience of the past few days, the state department of agriculture suggests again that the important question of windbreaks be taken up by communities, cooperative associations, chambers of commerce and boards of trade throughout the state that such future needless and preventable holocausts be averted for the sake of ourselves and for the sake of the coming generation.

Let us now form a workable program for Arbor Day, 1922, in order that a systematic campaign to this end be established.

ALMOND FIGHT NOT GET WON

Speaking of the effort to secure a just tariff on almonds, President Geo. W. Pierce, of the California Almond Growers' Exchange, says:

"Adoption of the minimum five and fifteen cent schedule asked for by the growers is absolutely necessary to save the American shelled almond market from control of the peasant produced commodity of Southern Europe.

"Because the 4 and 12 cent schedule was an increase over the original 4 and 8 cent provision in the Fordney bill, the false impression prevails throughout the state that the almond farmers won a victory in their life and death struggle to save their investment of millions of dollars and years of unproductive labor from the disastrous effects of foreign competition.

"Failure of the house to heed the plea of California's congressmen for the necessary 5 and 15 cent schedule was a bitter disappointment for us and a distinct victory for Southern European almond interests who now control the American shelled almond market.

"We plain farmers did not play the usual political game of asking for more than was necessary and then accepting a lower figure at the last minute. Instead we employed university experts to study our needs and decide on conservative figures. Their report was for a 5 and 15 cent schedule on unshelled and shelled almonds, based on the natural 3 to 1 shelling ratio of the nuts. That was our demand, an absolute minimum figure, not a maxi-

mum that would bear compromise or cutting.

"Our congressional delegation forced the house to recognize the justice of our claims by establishing the principle of the 3 to 1 ratio, but the ways and means committee failed to express that ratio in the imperative minimum figure of 5 and 15 cents."

California has 100,000 acres planted to 7,000,000 almond trees, representing an investment of $65,000,000.

FIG PACKING SCHOOLS

Arrangements have been completed by the California Peach and Fig Growers for special demonstrations of methods of packing fresh figs during the first week in August. George F. Sykes, inventor of the Sykes system of packing, will give the demonstrations and members of the association are invited to be present. An itinerary has been arranged which will take Sykes into the principal growing sections and he will demonstrate daily the proper methods to pursue in shipping figs fresh.

The experimental carload of fresh figs sent east by the California Peach and Fig Growers demonstrated that properly packed and loaded, figs can be shipped long distances and will arrive in perfect condition. The experiment also proved that good prices can be expected for the fruit.

It has been deemed essential that the growers adopt a uniform pack in shipping and the coming demonstration, it is believed, will serve the purpose of standardizing the package.

Fruit men of long experience are confident that the adoption of a standdardized pack and proper shipping methods means the establishment of a new and lucrative outlet for California figs.

Itinerary arranged: August 1, 2 P. M., Winters; August 2, 10 a. m., Sanders Calimyrna Orchard, one mile north of Modesto city limits; August 2, 2 p. m., Acock Calimyrna Orchard, Ceres; August 3, 10 a. m., Fig Packing Plant No. 3, Merced; August 4, 10 a. m., Markarian Fig Gardens, Fresno; August 4, 3 p. m., California Peach and Fig Growers Plant, Reedley; August 5, 10 a. m., orchard of E. C. Dewhirst, Sultana.

PLACER COUNTY WAGE SCHEDULE

Placer County farm bureau has adopted the following wage schedule:

Unskilled labor, 35 cents per hour.

Packing cherries, 20 cents standard box and single faced lug.

Packing cherries, 25 cents double faced lug.

Packing plums, 6 cents per crate.

Packing wrapped plums, 6 cents per box.

Packing lug plums, 6 cents per box, graded.

Packing peaches, 2½ cents per box.

Packing pears, 6 cents per box.

Packing grapes, 5 cents per box, cleaned.

Making peach and solid crates, 24 nails, 75 cents per 100.

Making pear crates, 28 nails and cleated, $1 per 100.

EXAMINATIONS FOR HORTICULTURAL COMMISSIONERS

Examinations for county horticultural commissioner and deputy county horticultural commissioner will be given on the following dates: Los Angeles, August 15-16; Fresno, 18-19; San Francisco, 22-23; Sacramento, 25-26; Red Bluff, 29-30. Salary of commissioner shall not be less than $6 per day and deputy not less than $5. A successful candidate will be eligible for five years after date of examination for any county. Further information may be secured from Director of Agriculture, Sacramento.

FRESH FIGS TO THE PRESIDENT

Acknowledging the gift of fresh figs from the first carload shipment recently sent from the state to eastern markets, President Harding wrote to Congressman H. E. Barbour of Fresno:

My Dear Mr. Barbour: Thank you, and through you the California Peach and Fig Growers, for this box of fresh figs. We are enjoying them hugely and are delighted to learn that at last your California people have found a way to ship their dainty fruit commercially. It will be one more addition to the number of delicacies that California enterprise has made available to people everywhere. Sometimes I wonder how generally people realize their obligation to you Californians for inventing the means by which to serve fresh perfect fruits everywhere and in all seasons. In building your fruit industry you have not only served the consumers but promoted fruit interests all over the world. I am glad to hear that the outlook is good for an early emergence of the California fruit business from the depressed conditions that lately have been hampering it.—Most sincerely yours, Warren G. Harding.

SAN LUIS OBISPO A FRUIT COUNTY

Horticultural Commissioner Harold E. Alley of San Luis Obispo County reports:

San Luis Obispo County is fast dedeveloping into a fruit and nut county. During the year 815,030 fruit and nut trees were planted. Besides these, there were enough other trees, plants and vines planted to make a grand total of 1,071,781 pieces.

In comparing the 1921 with the 1920 inspections, almonds lost 90,987 trees, all fruits but peaches and prunes decreased; there being 95 more peaches and 78,620 more prunes in 1921, the number of prunes increasing two-fold. Grapes increased ten times and berries doubled. The great increase in ornamentals was due to the large plantings which were put in on the W. R. Hearst Ranch at San Simeon.

STATE POLYTECHNIC SCHOOL

The management of the state polytechnic school at San Luis Obispo writes that the school is prepared to enroll next year only about 300 students, and that it is advisable for prospective entrants to the technical courses to put in applications for admission immediately for the term opening early in September.

"The state polytechnic school prepares you for life. You have the advantage in this school of finding out whether you would like to learn a trade, get practical training in agriculture, or would rather take up a profession. If you prefer the last the state polytechnic school diploma admits you to the university."

PLANTING ALMONDS IN SAN LUIS OBISPO

San Luis Obispo County orchards made heavy plantings of almond trees again this year, 567,238, according to report of County Horticultural Commissioner Alley. Last season's planting was 658,223. Grape vines planted totaled 67,404 as compared with 6,976 the preceding year. Prunes were also heavily planted, 149,246 trees this year; 70,626 last year.

OLIVE CROP REDUCED

G. H. Flournoy, county horticultural commissioner of Tehama County, reports that county's outlook much lighter than estimated at time of heavy blossom.

Under date of June 13, Chas. F. Collins, county horticultural commissioner of Tulare County, states that further investigation of rain damaged olives in his county indicate a 1921 crop of about 40 per cent of normal.

The Willamette Valley Prune Association of Salem, Oregon, will establish pools for handling loganberries for its members and for outsiders. The berries will be evaporated.

KIRKMAN NURSERIES

Reliable Trees and Vines

For Commercial Orchard and Vineyard Planting

Deliveries made direct from nearest propagating plant. To serve the orchard and vineyard planters of California to the fullest satisfaction and efficiency is our aim. We are gratified to have entrusted to us the future of small orchards as well as the large projects. One acre of Kirkman Trees will draw to us greater future plantings. One California orchard has taken two hundred and fifty thousand of our trees. Another four hundred thousand trees. Another six hundred thousand trees and vines together. They have reservations with us for their next season's plantings. The Ex-Governor of Coahuila, Mexico, named his immense project "El Fresno" in honor of our deliveries of nursery stock. We plan to serve every customer so satisfactorily that his future profits will be assured. Correspondence solicited.

Kirkman Nurseries

Fresno, California

Member of Nurserymen's Bud Selection Association of California

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Diseased Liver in Rabbits

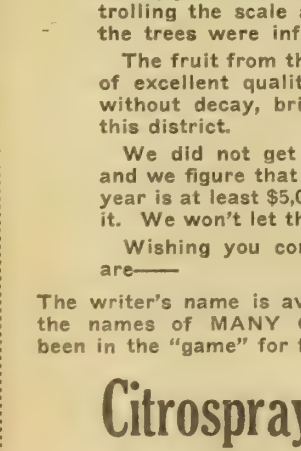
Kindly tell me what makes spotted livers in rabbits? Occasionally when I kill one it has light spots on the liver. What will cure it?—Subscriber.

There is no satisfactory treatment of liver trouble of rabbits other than thorough cleanliness, dry quarters, disinfection. Reduce or discontinue green feed and feed only on clean fresh grain and well cured alfalfa.

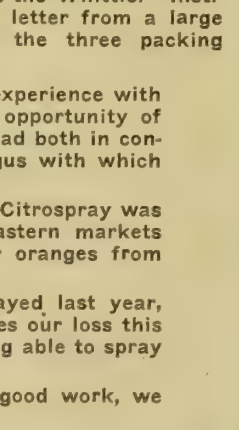
This Fixture $5.50

A very popular two-light fixture, similar to the one we illustrated last week which had three lights—has "brushed brass" pan supporting two lights with art glass globes. A noticeable buy at this price.

This Fixture $15.00



The handsome living-room fixture illustrated to left, with three massive chains which support the tinted art glass bowl and three outrider lights, combine the advantages of direct and semi-direct lighting.



House Wire, $1.00 Per 100 Feet
No. 14 insulated wire, outside wire or inside wire at same price.
Plug Fuses, 5c each, 10, 20 and 30 Amp.
Split Knobs, $3.50 Per 100
Concealed Rosettes, 20c each.
Loom, 4c foot.
Entrance Switches, 85c.
Snap Switches, 40c each.

Electric Door Bells, 65c each.
Cleat Receptacles, 18c each.
Lamp Cord, $2.00 per 100.
Solid Knobs, $2.50 per 100.
Key Sockets, 35c each
Flush Switches, 40c ea.

Write For Electrical Catalog

Schumacher Wall Board $40

By special arrangement we are offering the factory seconds of this splendid board at this remarkable price. A large stock of this board in 6, 7, 8, 9, 10, 11 and 12 ft. lengths 48 inches wide.

Use it for interior finishing or exterior work; it's proof against damp, heat and cold. In these seconds one side is in good shape.

Lumber, Sash, Doors, Builders' Hardware, Plumbing, Etc.
Everything for Your Building

415 E. Ninth St. Los Angeles

REFUTATION

Despite statements to the contrary emanating from sources which ought to be reliable, we are able to prove, by statements of PRACTICAL GROWERS and PACKERS that one spray compound containing arsenic has caused none of the deplorable and disastrous results reported with such gratuitous concern by experts at the Whittier "Institute," in witness whereof we offer the following letter from a large and successful citrus grower and manager of the three packing houses:

Replying to your inquiry regarding our experience with Citrospray, will say that we welcome this opportunity of telling you of the splendid results we have had both in controlling the scale and cleaning up the fungus with which the trees were infested.

The fruit from the orchards sprayed with Citrospray was of excellent quality and arrived in the eastern markets without decay, bringing the top prices for oranges from this district.

We did not get all of our orchards sprayed last year, and we figure that on one orchard of 12 acres our loss this year is at least $5,000 on account of not being able to spray it. We won't let this occur again, however.

Wishing you continued success in your good work, we are——

The writer's name is available to anyone who is interested; besides the names of MANY OTHER PRACTICAL GROWERS who have been in the "game" for from 10 to 30 years.

Citrospray Chemical Co., Ltd.

2205 Santa Fe Avenue

Phone 41645 Los Angeles

Canada Thistle

Here is a little experience with Canada thistle to cheer your correspondent. Once upon a time on an eastern farm there was a field of oats badly infested with Canada thistle. To the fancy of the boy who shocked the sheaves the thistle stalks about equaled the grain. Note that the crop was harvested when the thistles were in full bloom. The following season on that same field the thistle stalks might have been counted on your fingers. So cheer up. I might mention that the Canada thistle is said to have come from Europe—Albert Jackson, Upland.

Stock Land Bank

Can you tell me if there is a federal loan bank in Los Angeles and where it is? And will they loan one money to put up a house on a five acre tract?—Subscriber, Torrance.

The federal farm loan bank is located in Berkeley and has no branch in Los Angeles although there are several farm loan associations which operate through the farm loan bank. There is, however, a joint stock land bank operating in connection with the Bank of Italy, corner of Seventh and Broadway, Los Angeles, which makes some long time loans. Also the address of one of the federal farm loan associations is H. O. Gardner, Bradbury Building, Los Angeles.

Foxtail

I am enclosing a specimen of grass that is bad in the alfalfa and in time destroys it. Would like to know some method of control. Would harrowing destroy it and would it be beneficial to the alfalfa? It seems much worse where the water comes on to the land at first and consequently where it stands the longest. Is this conducive to ranker growth in this particular grass?—Subscriber, Lankershim.

This is one of the foxtail family although not the most perplexing by any means. It is an annual and fairly easy to eradicate. This fall, say early in November, set your disk so as to cut nearly vertical, thoroughly disk the ground and seed with about 30 pounds of barley to the acre. If there are spots which are completely bare of alfalfa a little hand sowing of alfalfa would prove beneficial. Let stand without pasturing through the winter and when the barley is in the stage for making hay, cut alfalfa, barley and all and it will be found the foxtail has almost entirely disappeared and the next cutting should give a high grade of alfalfa hay.

Church Paying Taxes

Does a church pay taxes on real estate? Again, does it pay taxes on improvements on said property if same is used as a church?—Subscriber, Walnut Grove.

A building used exclusively for religious purposes is tax exempt in California. Some churches, however, prefer to rent portions of their buildings for other purposes and in such cases are taxed exactly as is other property.

Horse With Cough

I have a three year old filly that lately has developed a dry cough. She eats and acts all right but it is annoying to hear this cough. She has had alfalfa and rolled barley but lately no barley.—Subscriber, Orland.

The best information we have touching upon this question is in "Diseases of the Horse" by the U. S. department of agriculture. Touching upon chronic cough this report says: "A chronic cough may succeed the acute diseases of the respiratory organs, such as pneumonia, bronchitis, laryngitis, etc. It accompanies chronic roaring, chronic bronchitis, broken wind. It may succeed influenza. * * * Cough is but a symptom and not a disease in itself. Chronic cough is occasionally associated with diseases other than those of the organs of respiration. It may be a symptom of chronic indigestion or of worms. In such cases it is caused by a reflex nervous irritation. The proper treatment in all cases of chronic cough is to ascertain the nature of the disease of which it is a symptom, and then cure the disease if possible, and the cough will cease."

Black Mildew of Vine

We have a few vines in our Muscat vineyard on which are spotted leaves drying up. Some people call this black mildew. I have tried sulphuring but it seems to do no good. Is this the proper name for this trouble and what must one do to cure it?—Subscriber, Selma.

The trouble described has been called black mildew, Spanish measles, red leaf disease, etc., and so far as we know the cause is yet to be discovered and the cure is still more uncertain. Vineyards throughout the San Joaquin Valley have been showing this trouble for several years but it is rare to find the same vine afflicted two years in succession. The application of sulphur or other sprays has little, if any, effect on the diseased vines, and the only recommendation which can be given at the present time is to improve the general cultural conditions in the vineyard, meaning the application of manure and fertilizers. Irrigation should be taken into consideration, assuring the vines plenty of plant food and sufficient water at all times that this food is made available to the plant.—F. K. H.

Soil and Water Conditions

A corner of ranch is sandy, and walnut trees once there are nearly all gone and the rest are not doing well. What trees would you advise? Have thought of peaches and grapes. Are plums and apricots good in light soil? Do all grapes need sulphuring? What varieties for early market of any of above do you recommend?—Subscriber, Clearwater.

It appeals to us that the first step in this case is thorough examination of soil and water conditions. While the soil is sandy this may only be a surface condition, and two, three or four feet underneath the surface may develop a subsoil of heavy 'dobe and possibly heavily impregnated with alkali. Unless soil conditions are entirely satisfactory then it may be well to take soil specimens to a depth of at least four feet, perhaps six would be better, and put these specimens of soil in the hands of a chemist who will be able to determine alkali or other deleterious content. Also, if there is any question as to the water used in irrigation, that might be examined and perhaps you might find that through drainage or use of a different irrigation water such walnut trees as are not dead may be restored. Once the soil conditions are determined then varieties would be much easier to decide upon.

Grafting Figs

Answering question as to caprifying and methods of work to secure a full crop of Smyrna figs, G. P. Rixford of the department of agriculture writes:

"This is the season for budding. Grafting is usually done in March or April. The fig tree can be grafted by any of the methods used for other fruit trees, the only precaution to bear in mind is to use two year old wood for scions. It has been found from experience that if new wood is used, it being soft and pithy, only a portion of the grafts will take, but if two year old wood is used and the work is carefully done, 95 per cent of them will grow. We do not recommend the grafting of a capri branch into the Calimyrna tree in orchard practice, for the reason that the tree carrying the graft would get most of the insects, and also for the reason that some of the capri varieties fail to carry the over-winter crop, and in that case caprifigs would have to be secured elsewhere; and also, a caprifig crop sometimes suffers from frost, as it has during the past winter in large areas in the San Joaquin and Sacramento Valleys. We therefore recommend that in orchard practice the caprifig trees be planted in a group by themselves, in that part of the ranch that is freest from frost, or in the vicinity of buildings or other trees that would give some protection. Your subscriber asks whether it would be advisable to insert one or two Calimyrna buds about

the same height on opposite sides of the trunk from the capri buds. I see no objection to this procedure but may remark that one caprifig branch would be amply sufficient to supply all insects necessary for his single tree."

Seasoning Eucalyptus.

A query has come as to seasoning or kiln-drying of eucalyptus lumber. This has always been a serious problem with the eucalyptus grower as the wood has checked and warped beyond all reason. We have seen no very recent suggestions as to methods of seasoning but in a "Handbook for Eucalyptus Planters," published in 1908 by the state board of foresters, we note the following hints:

"The difficulties experienced in seasoning eucalyptus timber have been a great obstacle to its more extensive utilization. It has received an undeserved reputation for warping and checking from many who have used it green or improperly seasoned. It is no more difficult to season than oak, hard maple, and many other hardwoods which are annually cut and seasoned by the mlilion feet in the Eastern states. The success attained by several experienced manufacturers proves that it yields readily to thorough methods.

"To insure successful seasoning the trees should be felled between November and March. Sawlogs should be maufactured as soon as possible after cutting, for they check quickly with exposure to sun and winds. When not to be sawn immediately they should be piled in the shade without peeling. The ends of the logs should be painted to prevent checking.

"Ordinarily sawn lumber should be loose piled under cover with abundant space for air circulation. The ends of the timbers should be weighted. By this treatment six by eight inch or larger timbers are thoroughly and evenly seasoned without warping or checking, though the wood may shrink considerably during the seasoning process. Inch boards are apt to warp in seasoning so the lumber is usually sawn into planks. The heartwood is more apt to check than the sapwood.

"Air seasoning produces better results than kiln seasoning. Air dried lumber may be used in a year, but two years' seasoning gives better results and is generally practiced."

Cover Crop in Walnut Orchards.

Is there a particular cover crop more beneficial than another for walnut trees? Is there one that would benefit the trees and at the same time furnish forage for chickens?—Subscriber, Lankershim.

No, the principal consideration is tonnage. That is, in speaking of cover crop and green manure combined. We imagine one of the principal benefits to soil from the use of green manure crops is betterment of the physical condition, and for that reason barley, rye, or other rank growing crop does well. However, there is an additional advantage in the leguminous crops in that they secure nitrogen from the air and add to the soil nutrients. However, a cover crop either for the purpose of shading or preventing soil washing may be of malva or other native and natural growth, the grains or any of the legumes, using care to choose a crop adapted to the location. As to a forage for the chickens at the same time it is the same as with any other crop. Success as a cover or green manure crop can not be had where poultry eats down the new growth. The clovers and practically all the legumes make excellent forage for the chickens.

Anthracnose of Avocado

Several named varieties of avocado have been discarded even for home planting, because they develop a brown spot on green skinned varieties that cracks and rots. These nearly always appear near the blossom end of the fruit. Investigations in Trinidad, West Indies, bring to light the fact that this disease is very similar or closely related to anthracnose of the mango (Gloeosporium or Colletotrichum). The report states:

"It is almost impossible to buy an avocado in the market that is not more or less attacked by the disease. As the fruit is eaten at once the disease does not cause serious loss, but if the fruit is packed for export they will rot in a few days. The disease first shows itself by the formation of a brown spot. If the attack takes place when the fruit is green the brown spot does not spread, a slight depression forms, and cracks appear all around the edge. If the attack is serious the young fruit falls before it is ripe; otherwise the fruit may ripen, but the skin cracks around the brown spot. When the fungus attacks fruit with a tender skin it penetrates the pulp and may extend to the seed, and the fruit gradually rots. A Bordeaux mixture spray should be used to combat the disease."

POTATO GRADING EFFECTIVE

F. W. Read, chief of the standardization service of the state department of agriculture, is highly gratified at the results secured for potato growers by the grading and shipping point inspection and through the adoption of the U. S. standard. The department and shippers are receiving commendatory letters because of this advance step taken by the department and California growers. We are permitted to quote from some of the letters as follows:

"The potatoes you have shipped into this market this season have been exceptionally fine and well graded. We notice that you are using the U. S. No. 1 grade and if the fact that you are using this grade is the reason for the stock being as good as we have received, certainly hope that you will continue to use the U. S. No. 1 grade. The buyers here have all commented favorably upon your potatoes and in some instances have been willing to pay a little more than other shippers were quoting to get your grade. I returned this week from a trip through the New Mexico territory and heard the same comments by the jobbers in Albuquerque and Las Vegas. I wish to emphasize very strongly the fact that the jobbers appreciate your shipping the U. S. No. 1 grade and you can see by the increased amount of business that we have sent you over last year that it has been of assistance to us in selling your potatoes."

* * *

"We wish to compliment you upon the grade and quality of the potatoes which you have shipped this year. It is certainly a pleasure to solicit business for this sort of stock. Everyone of our dealers who bought potatoes from us has been highly pleased with the grade and quality, and each shipment has meant a repeat order as soon as the goods were unloaded. Of course, as you know, it has been necessary for us to exact a premium for these potatoes over the quotations of other shippers, but the dealers admit to us that our stock has been worth the difference. It took considerable argument and persuasion at the start of the season to convince them of the superior grade and quality of our stock, and in view of the lower prices quoted by competitors, the volume of our business has not been as heavy as it would have been had the dealers known at the start the good work that you were doing at that end of the line in taking care of the grade in the manner in which you have.

"We trust that you will continue your policy of grading your future shipments, and we know that it will result in an increased demand at higher prices than is possible to obtain for ungraded stock. As soon as the dealers fully realize this it will be a much easier matter to secure a premium on such shipments."

FIXING SAND DUNES

By Ernest Braunton

The problem of fixing shifting sand dunes is a serious one in all parts of the world, and a list of materials to use, in succession, for reclamation of moving beach sands has brought to light details of hard yet successful struggles on the part of the planter.

Golden Gate Park, San Francisco, is a magnificent living monument to the persistency and untiring efforts of John MacLaren, superintendent for the past third of a century. "If you would see his monument, look about you." may be read on a tablet recently placed in the park. The first work done by MacLaren was the planting of "beach grass," a member of the timothy tribe, known to the botanist as Ammophila (Calamagrostis) arenaria. Recent experiments have proven that Napier grass, from Africa, one of the millet tribe, and by name Pennisetum purpureum, is second to none as a seaside windbreak, so it is beach grass first and nearest the water to fix the sand, and Napier grass across the wind's path, to stay its fury.

Arundo Donax, the giant reed, common to all parts of California along waterways, is another "sure" windbreak and sand-stayer. In hardwood shrubs or small trees any species of tamarisk will grow but the evergreen species recently introduced (Tamarix articulata) seems the best. Parkinsonia aculeata, the palo verde, Acacia latifolia, Albizzia lophanta, Robinia pseudo-acacia, or locust tree, should be next in order of planting. Then may come Pinus radiata, the Monterey pine; Pinus halepensis, Aleppo pine; Eucalyptus viminalis and E. globulus. Our sand is now fixed and forested but sand alone will not maintain the trees, and fertilizers are needed or dwarf and stunted growth will result. After these species are fixed and fed, any plants will grow if proper soil is given, but a high standard of fertilization must be maintained to insure permanent success.

SAVE THE LANDMARKS

California is becoming a thickly settled state and its chief cities are expanding at a phenomenal pace. Ancient landmarks are lightly removed by the newcomer who sometimes becomes a "ruthless invader." In some cases landmarks are destroyed through ignorance of their value. This is true in many cases even after vigorous protest is made.

The largest white sapote tree (casimiroa edulis) in California was recently cut down by a real estate firm in the suburbs of Los Angeles after hundreds had protested its destruction.

It stood at a point where it was unusually conspicuous and could have been saved without change in the plans for subdivision of the tract. Such action is clearly vandalism, for much capital could have been made of its size, age and value. A sign on the trunk stating what it was, etc., would have proved attractive to lot purchasers and of decided value to the tract, to the neighborhood, and, to a small degree, to the world at large.

But one other of like size grows in California, and that one is on the Landenberger place near Anaheim, where it doubtless will long remain, noted as "the largest sapote tree in the United States." As such it has a far greater value, both real and sentimental, than the mere land it occupies, for it bears fruits both rare and luscious.—E. B.

JAPANESE LANDSCAPES

Geo. C. Roeding, writing from Kioto, Japan, recently, says: "Wish you could see some of the Japanese gardens I visited today. They are backed up by hills covered wirh cryptomeria and cypress. The gardens are charming in every sense of the word and I am sure you would revel in the scenery of Japan. Kioto is the ancient capital of Japan, a most interesting place. Whether in the valleys or on the mountains, the country is always green with verdure. There is never a dearth of water here."

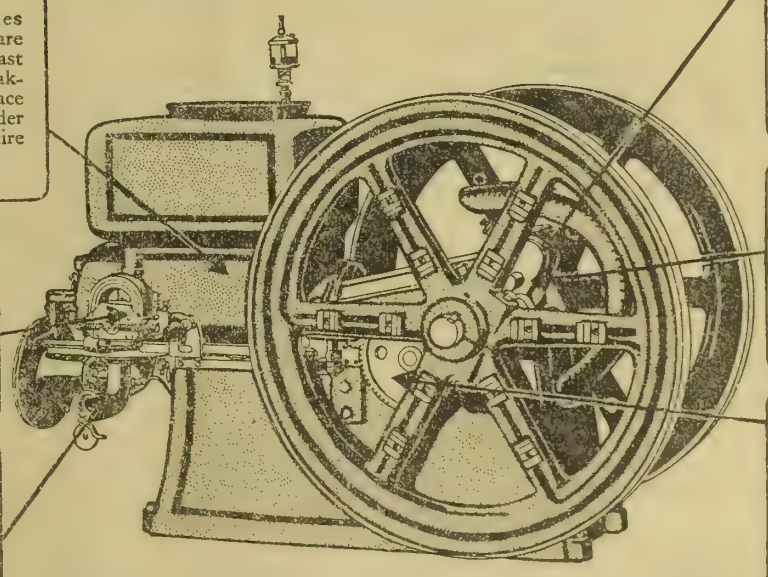
HERCULES Gasoline Kerosene ENGINES

1½, 3, 5, 7, 9, 12 H.P.

DETACHABLE CYLINDER
All Hercules Engines above the 1½-H. P. are built with cylinder cast separate from base, making it possible to replace either base or cylinder instead of replacing entire frame.

WEBSTER MAGNETO
The Webster Tripolar Magneto is used exclusively on the Hercules, and the wonderful Webster Service insures efficient ignition at all times.

CARBURETOR
The Hercules Carburetor or Mixer makes possible the successful use of distillate, effecting a big saving in fuel cost.



CONNECTING ROD BEARING
All connecting rod bearings on crank pin end are die cast, made of white bronze, and are adjustable and interchangeable.

MAIN BEARINGS
White Bronze Metal, Die cast in halves. Removable and interchangeable. Ten minutes' time and a monkey wrench removes old bearings and installs a new set.

GEARS
Cam gear is made of best grade grey iron, machine cut. Governor gear and crank shaft gear cut from solid blocks of steel. Hardened steel cam on 3 to 12 H. P.

LIFTING YOUR HEAD

To lift your head and say—
I am beyond the storm today!
This is the pride becoming to one's life
In the mad world's rude strife.
This is the power that many envy kings.
He also has it in whose spirit sings
The joy of an abundant faith in being
A child of the sunbright seeing.

To lift your head and cry—
I have been wounded, but I shall not die!
This is the faith that makes
Martyrs of men for helpless creatures' sakes;
This is the spirit of herohood more sure
Than all the actions men applaud with cheers—
For this beyond the action shall endure,
And be remembered in immortal years.

To lift your head above
The blight of blowing winds and keep
Steadily onward with unfaltering love—
This is the gift that leads one to the steep,
That guides the footsteps where
The angel of victory sets her deathless light
To lead men to her height—
Men who can lift their heads and say—
I am beyond the storm today!
—Folger McKinsey.

A HOME FOR JACK-O'-LANTERN

By Edna Tucker Muth in Youth's Companion

IN the little chapel of St. Barnabas Ruth Keniston and Ermina Vincent, first-year nurses in training, sat side by side.

As Ruth listened to the reading of the hymn she heard Ermina catch her breath in a sigh that was almost a gasp.

"What is it, Ermina?" she asked, gently shaking her friend's arm. "What are you worrying about?"

"A home for Jack-o'-Lantern," Ermina answered. "It's his last week here, and I'm almost desperate."

There was no time for Ruth to speak. They rose with the little choir, and the sound of young voices overflowing the dim chapel echoed along the corridors of the hospital.

"Joy to the world, the Lord is come!
Let earth receive her King—"

Suddenly, from without, a voice high and clear like a bird note took up the hymn. It was the voice of a child singing in perfect time and tune. The chorus within the chapel softened until the new voice seemed to lead.

The hymn ended presently, and two by two the nurses walked briskly away to their corridors. As always, Ruth Keniston and Ermina Vincent walked together, but, not as always, they they talked in sober tones.

"A home for Jack-o'-Lantern," Ruth was repeating. "If only somebody could hear him sing before they saw his freckles!"

"That's the idea, Rufus. I'm getting up a sort of scheme. Don't ask me or you'll be abetting me in it, but with or without abetting I'm going to find a home for Jack-o'-Lantern. Yes'm!"

Ruth stood still and shook a finger warningly.

"Then sit right down and count ten, Mischief," she said. "O Ermina, I'm just as anxious as you are! I suppose I ought to nip your scheme by asking about it, but I won't."

"Five people have been up here to see him in the last two weeks!" moaned Ermina. "Five people, who went off and took little dimpled things without any backbones, but with lots of curly hair or with flashing black eyes. There Jack sits in 211, getting stronger every day and perfectly sure that he'll have a father and a mother and a home when the right time comes. I've promised him that. I would be dreadful if I couldn't get him a home. If he goes to some institution next week, I'll lie down and kick and scream."

Ruth smiled as she walked toward the diet kitchen. She was used to Ermina's impulsive threats. She had acted as Ermina's pilot in the first stormy days of probation and had helped her sail through with colors flying. She had been present when even Ermina's pleasure loving guardian gave her due praise for perseverance, and in Ruth's own pleasant home there was no guest more welcome than Ermina with her gay laugh and tumbled curly head. Lieut. Bob, Ruth's brother, once said, "I like to see a butterfly make good." He had taken Miss Leech, the superintendent of nurses, to dinner, and they had talked of Ermina.

"She is wonderful with children," Miss Leech had said.

"I was a lonesome youngster myself," Ermina told Ruth. "No one helped me to play. Perhaps if I had had more fun in that gloomy old house watched over by servants, I should not be overdoing it now."

Three weeks before this morning in the chapel, the charity ward at St. Barnabas had overflowed, and Jack and Ralph, two waif patients, had been moved to room 211 in the children's corridor of the new building. In this two-bed room Jack now sat erect singing to himself. As Ermina put down his tray, he smiled at her, and it was not hard to see why she had given him his name. Under very light blue, white lashed eyes spread a mouth of generous proportions, always curved in a smile.

"Now, young man," she admonished him this morning, "if you want to get strong enough to run races after your bath, you'd better eat a wonderful breakfast. One to get ready! Two to keep steady! Three to eat bready! Go! Ralph, what do you think the fairies will bring you if you don't eat oatmeal?"

"Ralph doesn't believe in fairies," said Jack, with his mouth full.

"O Ralph, after yesterday and all the nice things they left by your pillow!"

"He doesn't believe in Santa Claus or fairies or anything. He just believes in people. He says nothing but people is really so."

"I'm glad you don't feel that way," said Miss Vincent soberly.

"I believe in fairies but not people," said Jack stoutly.

"So do I sometimes," agreed Miss Vincent.

"Ralph says he doesn't need any fairies," Jack went on. "He is going to get a father and a mother today."

Ermina flushed.

"Perhaps," she replied. "If the right father and mother come, he will; but if the wrong ones should come, they'll go away again."

"Five times they did that to me," said Jack.

"I think if I were a boy and wanted a father and a mother more than anything else in the world, I should go to the fairies with it," Miss Vincent began craftily. "Everyone has to do his best for the fairies, and if one were prowling through the corridor and heard a boy singing his very best at the right time it might drop in and say, 'You can have one wish,' the way they do in books, and then a boy could come right out and tell about a father and mother and a home. Maybe he could sing a father and a mother right into the room himself without any fairies."

"How would I know one was prowling, Miss Vincent? I can't see the corridor."

"What if I should find out for you? I could stand in the corridor, and then at the right time I could come to the door and hold out my hand like this. It would be a signal, and you could begin to sing that very second. The same song you sang this morning—your very best. And maybe—mind, I only say maybe—"

"I'd like to try it," breathed Jack-o'-Lantern.

"So should I," said Ermina.

"Shall we?" said Jack.

Ermina nodded.

That day Ruth and Ermina had their hours off together in the morning, but, contrary to custom, Ermina avoided Ruth, and when they were together listened half-heartedly to her plans for the vacation that was very near.

"Are you cross about something, Ermina?" Ruth asked at length.

"Don't ask me questions, Ruthie, please don't. I'll tell you fibs if you do."

Ruth looked troubled as she stood facing her friend. Here was the old impulsive Ermina.

"Is it—" Ruth began. "Tell me, Ermina—"

The Cultivator Patterns

3679. Girl's Dress.—Cut in four sizes: 6, 8, 10 and 12 years. A 10 year size requires 3½ yards of 27 inch material. Price 10 cents.

3678-3662. Ladies' Costume.—Waist 3678 cut in seven sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. Skirt 3662 cut in seven sizes: 24, 26, 28, 30, 32, 34 and 36 inches waist measure. To make the dress a 38 inch size requires 5⅞ yards of 36 inch material. Its width at the foot is about 2½ yards. TWO separate patterns 10 cents FOR EACH pattern.

3266. Child's Play Dress.—Cut in four sizes: 2, 4, 6 and 8 years. A 4 year size will require 3⅜ yards of 27 inch material. Price 10 cents.

3667. Ladies' Porch or House Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 5 yards of 36 inch material. The width of the skirt at the foot is 2 yards. Price 10 cents.

3677. Boy's Suit.—Cut in four sizes: 3, 4, 6, and 8 years. A 4 year size will require 2¾ yards of 36 inch material. Price 10 cents.

3666-3569. Ladies' Costume.—Waist 3666 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3560 cut in six sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. To make the dress for a 38 inch size will require 3¾ yards of 42 inch material. The width of the skirt at the foot is 2¼ yards. TWO separate patterns 10 cents FOR EACH pattern.

3654. Child's Dress.—Cut in four sizes 1, 2, 4 and 5 years. A 2 year size requires 2¾ yards of 27 inch material. Price 10 cents.

3683. Ladies' Apron.—Cut in four sizes: Small, medium, large, and extra large. A medium size will require 4½ yards of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT
California Cultivator
Los Angeles

"Don't ask me! I'm having some underhand dealings with a fairy of my acquaintance, and that's all I will say. Good-by, Ruthaline!"

During the first part of the afternoon Ermina hovered about room 211. She arranged and rearranged the plants in Ralph's window; she fed the bird and at Jack's request carved a little bird from a large piece of cuttle bone; she told cowboy stories for Ralph and fairy stories for Jack. But every other minute she darted into the corridor. Ralph was expecting his new parents, and Jack his fairy, and they were often disappointed when Miss Vincent returned with neither.

Presently Ermina heard Ruth's quiet voice in the corridor. Ruth did not belong in that part of the building. What was she doing here? Ermina stood in the doorway watching her best friend's head appearing through the banisters. Ruth came up to the landing, and behind her came two people, a man and a woman. The woman was very pale and walked slowly; her hand was on her husband's arm. "She made me think of Easter lilies and telling stories after supper and eveything that's lovely," Ermina said afterwards. "But I wished Ruth hadn't brought her up."

She could not afford to hesitate, however. Her hand went behind her in the prearranged signal to Jack. As the three visitors stepped into the corridor, a burst of joyous music came from room 211. There stood the old headstrong Ermina. Any means to gain her end, and yet—Jack-o'-Lantern deserved a home.

(Continued Next Week.)

RAISIN DELICACIES

A half dozen unusual and attractive recipes. Save them and try them.

Raisin and Grape Conserve

Three cups grapes, 1 cup water, grated rind of one orange, juice of two oranges, 2 cups sugar, 3 cups chopped Sun Maid raisins, 1 cup chopped walnut meats. Mash grapes. Add water and cook until seeds separate. Rub through strainer and discard seeds and skins. Add orange rind and juice, sugar and raisins and cook until thick—about 30 minutes. Add walnut meats and cook five minutes. Pour into sterilized glasses and seal with paraffine. This makes about six glasses.

Raisin Jam

Three cups rhubarb, 3 cups sugar, 6 oranges, 1 cup raisins, ¾ cup chopped walnut meats or blanched almonds. Cut rhubarb in small pieces. Add sugar and cook until tender. Add orange pulp and raisins, cut in small pieces. Cook until thick — about 20 minutes. Add nuts and cook five minutes. Pour into pastry shells for tarts or serve as jam. This may be served as a dessert with whipped cream, if desired.

If made in a large quantity it may be poured into sterilized glasses and sealed with paraffine.

Prune and Raisin Conserve

One cup prunes, 1 cup Sun-Maid raisins, 2 cups cold water, 1 cup brown sugar, 1/3 cup vinegar, 1 teaspoon cinnamon, ½ teaspoon cloves, ½ teaspoon allspice, ½ cup chopped blanched almonds. Soak prunes and raisins over night in cold water. In the morning cook in the same water until prunes are tender. Discard pits from prunes and cut in pieces. Add sugar, vinegar and spices. Cook until thick—about 45 minutes. Add almonds and cook 5 minutes. Pour into sterilized glasses and seal with paraffine. This makes about six glasses.

Raisin Peach Conserve

Three cups dried peaches, 3 cups water, 3 cups Sun-Maid raisins, 3 cups sugar, 1½ cups chopped blanched almonds. Cut peaches in small pieces. Cover with cold water and soak over night. Add raisins and sugar and cook until mixture thickens—about 30 minutes. Add almonds and cook five minutes. Pour into sterilized glasses and seal with paraffine. This makes about six glasses.

Rhubarb Compote

Six dried figs, cut in pieces, 1 cup cold water, 6 cups sliced rhubarb, 3 cups chopped Sun-Maid raisins, 3 oranges, 1½ cups sugar, 3 bananas, sliced, 1½ cups broken walnut meats. Soak figs over night in cold water. Add rhubarb and raisins and cook until thick—about 45 minutes. Add orange pulp, sugar and bananas and cook 10 minutes, stirring often. Add walnuts and cook five minutes. Pour into sterilized glasses and seal with paraffine. This will make about six glasses.

Pineapple Marmalade

One pineapple, 3 cups sugar, 3 lemons, 3 cups Sun-Maid raisins. Pare pineapple and cut in small pieces, saving all the juice. Add sugar and grated rind and juice of lemons. Cook slowly until very thick — about 40 minutes. Add raisins. Cook 10 minutes and pour into sterilized glasses and seal with paraffine. This makes about six glasses. Two cans grated pineapple may be substituted for the fresh, if desired.

WOMEN FARMERS

The 1920 census gives us some interesting facts as to women farmers. This is the first census which has given these separate figures.

In the entire United States there are 261,553 women operating farms totaling 25,798,000 acres. Average acreage in farms operated by women is surprisingly high, 98.6 as against average acreage in farms operated by men of 150.3. Most of us probably would have guessed at five or ten acres as the average for women.

Naturally, the older settled regions show the larger percentage of women farmers. There is an astonishing number in the Old South, 115,477 in the states south of the Ohio river. The New England states shown 8,979; the Middle Atlantic, 16,835.

In the Pacific states California has 5,774 women farmers, 5,406 of whom own their farms. These women farm 834,791 acres. In Washington there are 2,433 women farmers, owning 2,261 farms, total acreage of 262,104. Oregon has 1,649 women farmers, owning 1,518 farms, total acreage of 272,682.

HINTS FROM HOUSEKEEPERS

Grape Pie—Fresno Cake

Grape Pie—We have been readers of your paper for a number of years and think it an excellent paper, in fact I could hardly keep house without it. We live on a ranch and of course we get lots of good farming information from it. I enjoy the household department, as I love to read and try the recipes that are printed from time to time.

I am sending two recipes, of which one is original. As we have a Thompson Seedless vineyard I have been experimenting on grape pies, so I have made one which we think is excellent, and I am sending recipe so someone else may try it. Of course I used the grapes that aren't ripe, just turned white, not too green:

Three cups sugar, ½ cup water, put on the stove, let boil. Stem and wash 3 pints grapes. Put them in the syrup and let boil until grapes are tender, then dissolve two heaping tablespoons corn starch in a little cold water and stir into them. Flavor with ground cinnamon. Bake in two crusts. This will make two large pies or three small ones.

If any of the readers have a better one would like to hear from them.

Fresno Cake—Am sending recipe for a cake which I call Fresno cake, as I got the recipe from Fresno, but have never seen it in the Cultivator:

One cup sugar, 1 cup flour, ½ cup ground chocolate (unsweetened), ¾ cup water, 3 eggs, 1 teaspoon baking powder. Put the water and chocolate on the stove. Let come to a boil. Beat yolks of eggs till stiff. Beat in sugar gradually, add the chocolate, then the flour which has been sifted several times with the baking powder. Last fold in the stiffly beaten whites and bake in a moderate oven about 45 minutes.

Filling: 1 cup powdered sugar, ½ cup chocolate, butter size of a walnut. Mix all together and moisten to a paste with canned milk, coffee, water or cream. Flavor with vanilla.—Mrs. Geo. Brill, Selma.

HOUSEHOLD QUERIES

Recipes Wanted.

Will some of our readers send through the household columns a recipe for plain rich cookies? What I have reference to is rich and flaky, without fruit or nuts in them, and are rolled instead of dropped on the baking sheet.

Also would like a recipe for good snails made with yeast, that have egg in.—Subscriber, Gilroy.

The Cultivator will be glad to extend subscription credit for recipes published in answer to this request. With recipe send name and address of one to whom you wish subscription credited.

"Talk of the Town"

"Did you ever ride so comfortably?" "Could you tell when you crossed the tracks?" "I looked at the oil gauge at 200 miles—apparently we didn't use any." "I averaged over 27 miles to the gallon that last trip—sand and mud most of the way."—You hear it everywhere. All America is talking of this astonishing Overland—and *America is proud of it too!*

Livestock News Notes

Lucy Pathfinder, one of the sows in the "World's Champion Duroc herd," owned by the Diamond Bar ranch, died recently. She was insured for $5,000.

"The Home Bank With Personal Service" is the slogan of the Farmers State Bank, Tulare, and one of the ways in which the bank lives up to its motto was recently brought to light by California Holstein-Friesien Association. In a campaign for new members a letter from the association reached R. C. Sturgeon, Holstein breeder and vice-president of the Farmers State Bank. Within eight hours Mr. Sturgeon had secured the memberships of two clients of the bank, both owners of registered Holsteins, thus bringing to them individually the service of his bank and their state breed association. This spirit, if put in more general practce by banks throughout California, would be a mighty fine contribution to the prosperity of their respective communities, for the Holstein cow has enriched every locality in which she has been given a home.

Warne & Sons, Holtville, are doing pioneer work in the Imperial Valley in official testing of their registered Holsteins. In their herd Bertha Pontiac Jewel 2nd made 22.47 pounds butter from 512.3 pounds milk in seven days and continuing on yearly test has 418.39 pounds butter from 10,036.2 pounds milk in 167 days. Fayette Segis with 18.20 pounds butter in seven days has to her credit 286.58 pounds butter from 7,220.4 pounds milk in 106 days. Bessie Abbekerk Colantha 2nd, calving as a junior four year old, has to her credit 426.7 pounds butter from 11,670 pounds milk in 177 days. Miss Floa Juliana as a senior three year old has to her credit 340.66 pounds butter from 8,953.8 pounds milk in 142 days. The Warne herd is headed by the richly bred bull Walker Allenvail It, sired by It and out of the 32.31 pound four year old Allenvail Pauline Walker that milked 609.8 pounds in seven days.

Seven more A. R. O. daughters have been added to the list of Sir Ormsby Skylark, the sire of Duchess Skylark Ormsby. Maxwell Farms, Hollywood, report that Bessie Mercedes Ormsby Skylark, dropping first calf at three years one month, made 22.6 pounds butter from 486.6 pounds milk in seven days, and 91.25 pounds butter from 2,119.9 pounds milk in 30 days. Rag Apple Johanna Skylark, at two years five months, made 21.49 pounds butter from 460.8 pounds milk in seven days. She is out of the 1,000 pound cow, Rag Apple Johanna McKinley Segis. Nancy Ormsby Skylark, freshening at two years four months, made 20.41 pounds butter from 415 pounds milk. She is out of the famous 40 pound cow Nancy Lucy Hengerveld.

Official testing is under way in the herd of registered Holsteins owned by Pottenger Sanatorium Company, Monrovia, and the latest record to be completed is that of the junior three year old, Korndyke Lieuwke Gerben De Kol, that made 23.28 pounds butter from 402.1 pounds milk in seven days. Their herd is headed by Rosamaines Pontiac Netherland, whose first five daughters to freshen have averaged 20.53 pounds butter from 417.1 pounds milk in seven days at an average age of 24 months.

The excellent herd of registered Holsteins owned by Alex Whaley, Tulare, will be dispersed at public sale on October 6. Included in the herd are 20 daughters of the noted young sire, Sir Aaggie De Kol Acme 2nd, one of the best bred yearly record bulls of the breed. Mr. Whaley does not intend to retire permanently from the Holstein business, but has some extensive changes and improvements to make in his farm before he will be ready to establish another herd.

S. O. Walker, Visalia, will disperse his richly bred herd of registered Holsteins early in October. This herd contains around 30 daughters of the famous bull, King of the Blacks and Whites, the first bull whose seven nearest dams averaged over 30 pounds butter in seven days. This great bull himself will be sold and he is still in splendid vigor and condition.

Robt. T. Curtis & Son, Exeter, will sell about 45 head of their registered Holsteins at public sale early in October. This herd is an example of what may be done in developing a good herd through judicious purchase and development of foundation stock. Star attractions in the offering will be the great 34 pound heifer, Coloma Beauty Butter Maid, and three splendid young daughters of the $12,000 bull, King Korndyke Pontiac 20th.

Widespread interest has been manifested in the future plans of A. W. Morris & Sons Corporation, Woodland, following the accident which resulted in the untimely death of A. W. Morris, founder of the organization. While no definite announcement has yet been made by the company, it may be stated on reliable authority that the four sons, Frank, Harry, Asa and Charles, will devote their combined energies to the development of the world famous herd of registered Holsteins, carrying on only such general farming operations as are necessary to provide feed for the cattle. In carrying out this plan it is probable that the extensive land holdings of the corporation will be substantially reduced.

Mooresta Ormsby of Vina, who sold with three of her daughters in the Gotshall & Magruder sale of Holsteins at Ripon for a total of $2,400, has presented her new owner, F. L. Hogue, Santa Barbara, with a fine heifer calf. This great young cow, only seven years old, now has six living daughters and promises to be the founder of a notable family.

A new test barn is soon to be constructed on the 1,100 acre ranch at Corcoran owned by Frank M. Helm, Fresno, and beginning this fall the 350 head of registered Holstein females in the big herd will be put on test as they freshen. Herdsman Harry L. Redd has a few on yearly test at the present time and is also shaping up a few head for the show circuit this fall.

The Maxwell Farms at Hollywood have just shipped a bull calf sired by Tritomia Pietertje Ormsby, a 1,100 pound son of Sir Pietertje Ormsby Mercedes and out of a 23 pound junior three year old daughter of Sir Ormsby Skylark, to Robert Lea & Son of Stevensville, Montana.

A. A. Jenkins of Tulare has recently sold to Harry L. Watters of Paicines a beautiful young Jersey heifer. Her dam is a daughter of Gertie's Golden Victor, her sire a son of Gertie's Son's Victor out of the Owl's Witch.

E. D. Barry, Jr. of Covina writes: "Our great white cow, King Hengerveld Honriette, has just completed another 30 pound record, after having milk fever and being very sick for several days, of 30.85 pounds butter from 593.4 pounds milk in seven days, and in her first month on semi-official test has made about 119.0 pounds butter. Her average for her last three tests is 30.91 pounds butter in seven days.

P. B. Long of Tulare writes: "Just want to let you know about the spring boar pig that I recently purchased from Henry Fesenmeyer of Clarinda, Iowa, the veteran Poland China breed-

Show Bull at a Bargain
Born Dec. 10, 1920
A young bull that combines the great qualities of Sir Pietertje Ormsby Mercedes and King Segis Pontiac.
TYPE PLUS PRODUCTION
Sire — Tritomia Pietertje Ormsby, a line bred son of Sir Pietertje Ormsby Mercedes and out of Alice Tritomia Ormsby, who made 34.43 lbs. butter in 7 days and 1,048.6 lbs. from 24.287 lbs. of milk in a year. This bull carries 62½ per cent of the blood of Sir Pietertje.
Dam—K. S. P. Queen Burke, a daughter of King Segis Pontiac. Her record is 31.12 lbs. of butter from 584.3 lbs. of milk in 7 days at 4½ years of age. His seven nearest dams average 31.3 lbs.
Tuberculin tested and guaranteed in every way.
MAXWELL FARMS
Near Universal City R.F.D., Hollywood, Cal.

er. This pig is sired by C-2 Ranger, the world's largest boar; dam Preston Giantess 2nd, a full sister to L. R. McClarnon's great boar, Challenger. He is a direct descendant on both sire and dam's side of Joe's Giantess, the foundation son of the present day Giantess family. From all indications at present he is going to live up to his pedigree."

Earl J, Sturgis, manager of the Hartsook Ranch at Lankershim, has just finished a record of 33.65 pounds butter in seven days with Korndyke Model 3rd, a junior four year old. Her best day's milk was 99.8 pounds.

Gertie's Son's Victor, the great Jersey bull owned by A. A. Jenkins of Tulare, has the distinction of having more Register of Merit daughters than any other Jersey bull in the state. Up to date 19 of his daughters average 7,364.7 pounds milk and 437.9 pounds butter in 12 months, at an average age of two years and four months. All of these records were made on two milkings a day and with no feed but alfalfa hay.

THE WAY OF THE FARMER-BREEDER

(Continued from Page 101.)

that must be the cornerstone of successful improvement.

After all, the livestock business is governed by the same fundamentals that govern other lines of effort.

Real and lasting success cannot be bought or otherwise acquired without effort. Pull, a plethoric bank roll or some social prestige count for little alongside of well directed effort. There is in the livestock business as much room at the top as ever and the way up is open to all.

And right now there is a real need in California for many more herds and flocks. Changing economic conditions will make a constantly widening demand for surplus stock of the right sort and prices will rule satisfactory. Beginners in livestock do not need to focus their attention on extreme high prices—they are for the speculator—but they can with confidence expect their productions, if properly handled, to return them a fair profit over what they would receive were they handling grade stuff.

There is every legitimate reason to believe that during the next five or ten years California will make rapid strides in the improvement of our livestock. That prediction is based on what would seem the soundest reasoning. And if such be the case, now is the time to lay a foundation on which to supply a demand.

That the demand will be met satisfactorily there can be little doubt. The main matter for many Cultivator readers to settle is whether or not they will be able to take a part. They can by making a modest start now and sticking with whatever breed they choose.

Among the successful livestock men of the future will be numbered men who may now regard themselves as so situated, perhaps, as to be handicapped to compete with men of greater means, but who ask for nothing more than a fair start and an open field.

Truly, we are entering upon a period wherein the so-called small farmer-breeder will be the bulwark of our livestock industry.

SUCCULENCE FROM SORGHUM SILAGE

Sorghum silage, according to the United States department of agriculture specialists, promises to become a champion yielder of winter succulence, not only for dairy cows but for other livestock which relish canned crops. Unfortunately, when sorghum was first used for silage purposes, many growers cut it too early, so that when the material was removed from the silo for feeding it was sour and acid and livestock rejected it. As a result sorghum gained an evil reputation although experiments have demonstrated that it is one of the most admirable crops for ensilage purposes that can be grown.

In five years' experiments at Hays, Kansas, the average acre yield of sweet sorghums was 10.34 tons, as compared with 8.06 tons of kafir and 3.8 tons of corn. In eastern Kansas, where the rainfall is 30 inches or more, on fertile soils sweet sorghums have yielded 18.2 tons an acre, as compared with 1.88 tons of kafir and 11.81 tons of corn silage. Detailed feeding experiments have shown that sweet sorghum silage is proportionately equal to corn and kafir silage for either beef production or the maintenance of stock animals, although for dairy cows this variety of ensilage is less productive because of its low content of protein.

Sorghum silage should be cut when it is mature, its ripeness being denoted by the presence of hard seed. The test for ripeness is when the seed will crack when crunched between the teeth. When cut at this time it produces a fine quality of silage which keeps well and is more keenly relished by cattle than corn silage. Experiments show that the average acidity of corn silage is 2.03 per cent, that of sweet sorghum silage is 1.46 per cent, and that of kafir silage is 1.43 per cent.

USE PURE BRED BULLS

The man with an ordinary native herd often feels that it is waste of money to use a pure bred bull on such herd. It is a common practice to use a grade bull first, and then later a pure bred. The pure bred bull does away with the native blood more rapidly than does a grade bull. In crossing native cows with a pure bred bull of any breed, the first cross will be what we know as a halfbreed; that is, half the blood in the offspring is from the pure bred sire.

To breed up a good grade herd and get rid of the native blood as rapidly as possible the quickest method is the successive use of pure bred bulls. In five generations only one-thirty-second of the native blood remains. As far as production, either of meat or dairy products, is concerned, these high grades may be as good as pure breds, if proper care has been exercised in selecting, breeding and feeding.

When a grade bull, even one which is three-fourths pure bred, has been used through five successive generations, there still remains more than one-fourth of native blood. No matter how long you continue the use of grade bulls of this class that one-fourth native blood will still remain.

A grade cow is one sired by a pure bred bull and out of a cow not a pure bred.

A pure bred is one whose sire and dam are both pure breds of the same breed. The only positive evidence we have that an animal is a pure bred is the registration papers. A registered animal is a pure bred which has been registered with the national registry association of that particular breed.—Univ. of Wis.

COSTS OF PRODUCING MILK

Dairymen throughout the country should be interested to know how many pounds of grain, hay and silage and how many hours of labor it takes to produce 100 pounds of milk in the different dairy sections of the United States. The bureau of animal industry, U. S. department of agriculture, began a series of studies in 1915 on groups of dairy farms to obtain accurate information of this kind.

The results are shown for southeastern Louisiana in Department Bulletin 955. The figures for northwestern Indiana are contained in Department Bulletin 858; North Carolina and western Washington in Department Bulletin 923, which may be purchased from the Superintendent of Documents, Washington, D. C., at five cents the copy. The various tables are based upon figures obtained during a two year study. The surveys include also an inventory of dairy buildings, livestock and equipment used.

Only by keeping records of production can the value of individual cows be known.

Save all heifer calves from the best producing cows in the herd to replace the unprofitable cows.

The feeding of scrub cows and the "scrub" feed of good cows are two of the commonest mistakes in dairying.

Masterpiece of Edgemoor

The Greatest of All Guernsey Bulls—For Which $40,000 Has Been Refused

Masterpiece was sired by Royal Rose King of Edgemoor who was by Imp. Itchen May King, grand champion of the P. P. I. E. in 1915 and grand champion National Dairy Show in 1920. Royal Rose King of Edgemoor was out of Belladia who made 934 lbs. of butter fat in 365 days in the certified milking barn.

Masterpiece is out of Jessebel of Edgemoor whose record of 12,434.9 lbs. of milk and 748.3 lbs. of butter fat at two years of age makes her the best daughter of the great Ne Plus Ultra.

Masterpiece combines great show-type with high production.

The females we offer for sale run high in the popular May Rose blood and Masterpiece combines all of the great May Rose blood lines.

The heifers are from good A. R. dams and will make excellent records. We are offering Californians a chance to get Guernsey females that cannot be duplicated and the price is right.

All animals tuberculin tested and guaranteed clean. Call or write at once.

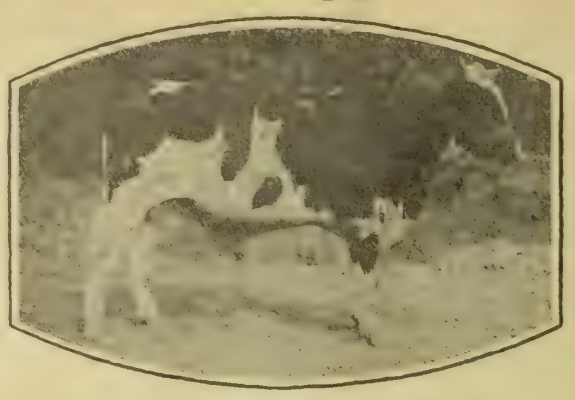
Sir Prince Aaggie Mead



Carrying in close combination the blood of De Kol of Valley Mead and Aaggie Acme of Riverside, each of which have founded groups notable in the breed's production records.

His sire's dam, AAGGIE ACME OF RIVERSIDE, with 1,054.1 lbs. butter in one year, is the dam of Aaggie Acme of Riverside 2nd with 1,331.7 lbs. butter in one year, the world's strictly official record, and she in turn is the dam of Miss Aaggie Acme Burke, 1,034.66 lbs. butter in one year as a first calf junior 2 year old.

His dam, MISS VALLEY MEAD DE KOL WALKER, with 1,113.58 lbs. butter in 342 days as a junior 3 year old, with 1,006.24 lbs. butter in 305 days at mature age under ordinary conditions, is out of De Kol of Valley Mead 2nd, 1,011.71 lbs. butter in one year as a 4 year old, and her two year production as a three and four year old was a world's record for age, she in turn out of the foundation cow herself, De Kol of Valley Mead.

This combination of breeding has been found most satisfactory and profitable by many leading breeders of California and other states. Why not consider a bull of this breeding for your herd?

"Good Enough" Cows Won't Do Today

By R. P. Royce

THERE are entirely too many ranchers in California who are content in believing that the sort and quality of their livestock is "good enough"—in fact, they believe their whole plan of operation is good enough, and after all, perhaps it is; it all depends on the point of view and the aim of the individual.

If the individual happens to regard his livestock and his investment in livestock as an incidental part of his business from which he has never received and does not expect a profit, then doubtless it is good enough. Certain it is that such a man would be better off without any livestock whatever. But if one looks to livestock to furnish him with a profit, then may he well ask himself, in all seriousness, if his livestock is good enough.

Before one reaches a satisfactory answer to that question it will be necessary that he establish firmly in mind a standard by which to measure the efficiency of his cattle, hogs or sheep; and so far as the writer has been able to observe, the one real standard of universal appeal is that of profit.

Farming is a business just as truly as banking or merchandising, and the man who engages in any business does so with the expectation that his efforts will be rewarded in a material manner, and if after a fair trial he finds that his business is not returning a profit, he gets out as best he can or he sets himself to the task of discovering the cause of the failure.

How many California dairymen know, really know, whether their cows are "good enough"? Do you, Mr. Reader, believe that your cows are good enough? How do you know whether they are or not? So long as there is a herd of cows in California that is producing more milk and butterfat than your herd, your cows are not good enough, and you owe it to yourself to head your operations in a forward direction.

Just as a matter of cold business California dairymen cannot afford to keep mediocre or average cows. In general our dairying is carried on on land of as high or higher value than is true in most states, and so from the start California dairymen are up against a stiffer proposition than dairymen elsewhere. Feed and labor in this state will rule about as high as elsewhere, and the average value of our dairy cows is probably higher than in the majority of states. It is therefore necessarry that our cows be of greater efficiency than can get by in many sections.

There are added and important reasons why our dairymen must give more attention to their cows. In the general readjustment that is under way the margin between production costs and selling prices is tending toward a shortening and it is becoming more difficult to register a satisfactory profit. It is good business in flush times to keep production costs at a minimum, but in tight periods it is absolutely essential that efficiency be practiced all down the line.

In dairying the place to inaugurate efficiency is in the milking barn, and fortunately the means for efficient practice are available to any dairyman who is willing to make the start.

In no branch of agricultural practice is it as easy and practical to discover actual production costs as in dairying, and in no branch of the entire industry is the way marked more clearly.

A pair of scales, a milk record sheet and a Babcock tester is all the equipment needed, provided the owner of a dairy herd really wants to know the truth about his cows.

This matter of testing dairy cows is of fundamental importance to the cow owner, and the information gained through testing is at once the starting point of sound dairying and a guide to herd development. Testing will disclose the individual production of the animals in the herd; will enable the owner to set a standard and eliminate cows that fall below the standard; will point the way to more careful and successful feeding and breeding; in short, will lift dairying out of the dark.

Suppose a dairyman, yourself, perhaps, should decide that his cows are not good enough, what's to be done? About the first step indicated by good business judgment will be to find out why some of the cows are not producing profitably. Unprofitable production is either due to poor breeding or poor feeding, or both. If your cows are unprofitable because of poor breeding there is little to do except dispose of them. If they are unprofitable because of poor management under which they cannot do their best for lack of opportunity, it remains for the owner to correct his system of management. In either case the responsibility of maintaining unprofitable cows rests solely on the shoulders of the owner, and no one else. Likewise, the responsibility of raising the standard of his herd to a point of profit depends upon intelligent effort of the owner.

Dairymen cannot expect their producers organizations to lift them out of an unprofitable business. Such organizations have and will accomplish much, but the real problem of unprofitable cows is not one for an organization to solve. Dairying is a good business, a sound business and a profitable business for the man who brings to the work intelligence, ambition and energy. It is not a good business for the man who thinks his cows are "good enough." That man, in a period of fundamental readjustment, will be left behind while his fellow dairymen who practice sound principles will progress.

NATE HAUCK OF HUMBOLDT COUNTY WINS CALIFORNIA CULTIVATOR PRIZE FOR JUNE

By F. W. Woll

Five cows owned by Nate Hauck of Alton, Humboldt County, had the highest average production of butter fat for grades in the state dairy cow competition during the month of June, viz., 74.95 pounds of butter fat, and the California Cultivator prize for this month was accordingly awarded to him.

The production of the individual grades for the month was as follows:

	Days in Milk	Milk Lbs.	Butter Fat Pct.	Butter Fat Lbs.
Brindle	33	2144	4.28	91.76
Red	19	1738	4.49	78.04
Nigger	81	1557	4.68	72.87
Speck	39	1643	4.22	69.34
Beauty	23	1385	4.53	62.74
Average	39	1693	4.43	74.95

The cows are all grade Jerseys but one, "Red," which is described as "common"; all but two four year olds are mature animals. These grades stood first among similar groups of cows in the 25 different dairy herds that competed for the Cultivator prize the past month. Of this number the average production of all but seven was above 50 pounds of butter fat, the lowest producing group averaging 27.98 pounds of butter fat for the month. Five grades in the herds owned by the following dairy farmers produced, on the average, over 50 pounds of butter fat: Nate Hauck, 74.95 pounds; W. Terkelsen, 74.30 pounds; J. A. Genzoli, 71.69 pounds; M. L. Pontoni, 71.36 pounds; Earl Graham, 69.69 pounds; Leo Christen, 69.24 pounds; E. Biondini, 65.46 pounds; F. F. Pellissier, 62.13 pounds; P. Iversen, 61.92 pounds; W. F. Early 61.66 pounds; Los Angeles County Farm, 57.31 pounds; Arden Certified Dairy, 57.01 pounds; Giacomini and Pedrotti, 56.68 pounds; H. L. Wakeham, 61.50 pounds; J. B. Harbers, 56.41 pounds; W. B. Gries, 54.48 pounds; Napa State Hospital, 54.00; and Adohr Stock Farms, 50.40 pounds.

This is the third month in succession that the Cultivator prize has been won by a Humboldt County farmer. Since the competition started this prize has gone six times to Los Angeles County, three times to Humboldt County, and once to San Joa-

quin County. The average production of these groups of five grades has only three times fallen below 70 pounds of butter fat, and it has three times exceeded 80 pounds — a production equal to slightly over three pounds of commercial butter per cow daily, and as much as three "good" dairy cows will produce. This suggests the possibilities of improvement in the production by dairy cows through the adoption of modern dairy methods, but it does not show the limit, as well-known to all who are posted on the wonderful records made by individual cows of the various dairy breeds.

BULLY FOR FRANK

Secretary Shaper of the San Bernardino County farm bureau writes of some excellent work by Frank Curtis of Chino, one of the pig club contestants. His work was so successful that it called for a letter of appreciation from the board of directors. The letter in full is:

"At the regular monthly meeting of the farm bureau directors on July 13, at this office, the secretary was given the pleasant duty of acting in behalf of the board of directors in complimenting you upon your unusual success in pig club work and extending best wishes for your success with your prize Duroc-Jersey hogs on the coming fair circuit. Your activities have been receiving our constant attention. We want you to feel that we are very proud of your success."

GETTING RID OF FLEAS

A number of readers have asked for information about ridding their premises of fleas. Now this is a "ticklish" subject. When one has fleas he is not proud of the fact and he doesn't want his name mentioned, consequently some of those who have written us didn't sign their names to their letters, but they were willing to let us in on their secret even if they didn't want their neighbors to know.

"How to get rid of fleas?" The answer to that question is something like catching a flea, it is a little difficult to put your finger on it. There are several suggestions that can be made that may be of service. But first let us say there are fleas and fleas, something like 500 different species being known to exist. Less than a dozen of these, however, are of special interest as pests to man and domestic animals.

The fleas that usually bother are those that live on dogs and cats. When these animals are infested and are permitted access to the house they are not a bit careful about where they leave their fleas, and it not infrequently happens they get the whole family to scratching. With this kind of fleas the dog or cat should be washed with stock dip or kerosene emulsion. Rubbing pyrethrum or insect powder in the hair is recommended by some. Then clean the rooms that are infested, taking up the carpets and removing all dust and organic matter. The floor should then be mopped with warm, soapy water and after it is dry, gasoline should be squirted into every crack between the boards and under the baseboards to kill the larvae and pupae. The bed or box in which the cat or dog has been sleeping should also be cleaned and disinfected.

Sometimes the barn becomes infested with fleas, particularly where hogs are permitted to sleep under them in the dust. The way to get rid of the pest under such conditions is to clean out the loose material and burn it and sprinkle salt over the dust and then wet down thoroughly. Crude petroleum sprinkled about will drive the fleas away. Scattering lime around is also good. It should be remembered that the fleas in the house and barn are due to the animals that sleep in or under the buildings and that the immature stages of the insect develop in the accumulation of dust and vegetable matter in the beds of these animals. A thorough clean-up is the first step to take in getting rid of fleas.

It may be a good thing for a dog to have fleas to remind him that he is a dog, as David Harum said, but there are few persons who wish to have the reminder applied to them. A little attention to keeping cats and dogs free from fleas will usually prevent any trouble from these insects in the house.—Indiana Farmers Guide.

WHAT ONE COW ACCOMPLISHED

A most interesting object lesson is given in an item published in the Pilot Rock Record giving the experience of Frank T. Byrd, owner of the Highland Stock Farm of that town. The same story is duplicated repeatedly by other breeders of pure bred cattle, but seldom are the concrete facts given for the benefit of others.

Back in March, 1912 Mr. Byrd bought at the Portland Shorthorn sale the cow, Lorne Lady Seaforth 6455, then eight years old, from Alex Chalmers, Forest Grove, Oregon, who bred and raised her, for $255. She had a calf at foot and was bred again, both by bulls of Mr. Chalmers' breeding. These two calves, both heifers, were named Lady Oregon 118795 and Lady Oregon 2nd 199051. The first named produced five heifers and two bulls, the second four heifers and six bulls. From the females were produced 17 animals—a total of 36 animals from the original cow.

Mr. Byrd sold 11, all bulls, for a total of $2,025, and has now remaining in his herd six bulls which he values at $1,170 and 17 females living upon which he places a value of $3,400, a grand total of $6,595 from this one cow which nine years ago cost him $255. The above are the facts as they exist in the placing of one good Shorthorn cow on the Highland Stock Farm, where no pretensions were made to prepare for the show ring and advertise breeding stock, where it is possible to gain the highest values. The owner just cared for them only as any farmer should care for his stock by proper feeding and attention at breeding time. You will find it just as easy to care for pure bred stock as it is to care for grades, and far more profitable. Why not put better stock on your farm?

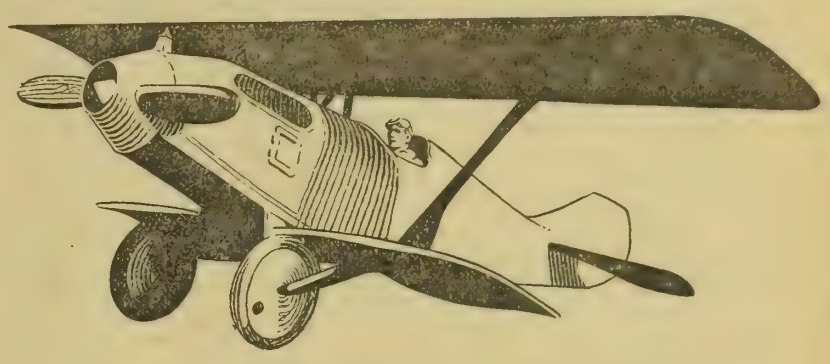
GOOD TEMPER IN LIVESTOCK

We cannot do as much work with a mean horse as we can with one that is easily managed. It takes more time to milk an excitable, kicking cow than it does to milk one that is quiet and gentle. It costs in time and money to keep a mean animal on the farm.

A mean temper in most cases is the result of improper handling. The habits farm animals have are generally the result of their training. The naturally vicious animal is rare.

Patience and gentleness are the prime requisites to the proper training of farm animals. It will pay in time and trouble to give the young animal the right care. It is much easier to give a young horse the right kind of attention than it is to cure an old one of a bad habit. It never pays to lose your temper and beat the animal. He doesn't understand why he is being beaten and becomes nervous and afraid. If your domestic animals are afraid of you and hard to manage it is generally your own fault. If they are gentle and tractable they save you time, labor and worry.—Indiana Farmers Guide.

Oregon prune growers are calling for reduction in freight rates similar to that offered the California growers by the Southern Pacific.



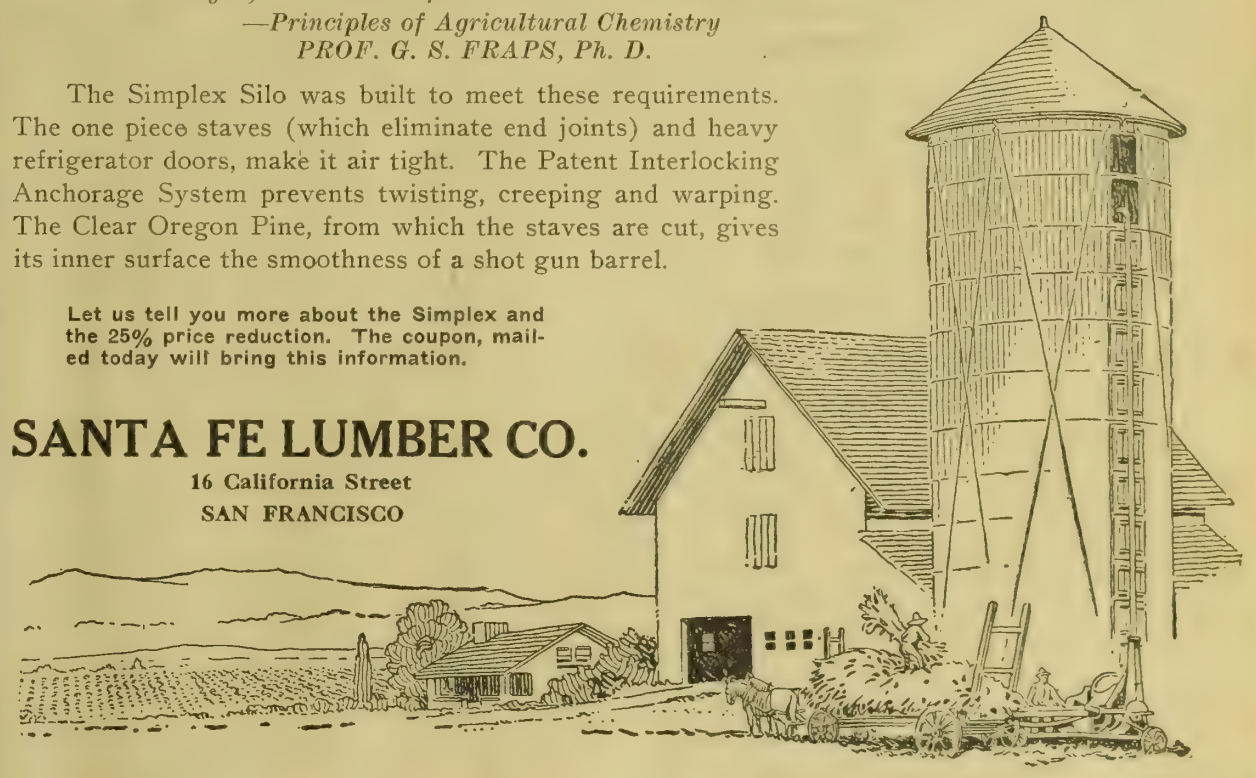
Scientifically Correct

Anyone can build an airplane that will look right. But the properly constructed aircraft—one that can be safely piloted through space — must be built in accordance with scientific principles. The same maxim applies to silos.

Science has discovered that the perfect silo must possess three things:

"A silo must be perfectly air-tight . . . . the walls must be rigid; the inner surface smooth."
—Principles of Agricultural Chemistry
PROF. G. S. FRAPS, Ph. D.

The Simplex Silo was built to meet these requirements. The one piece staves (which eliminate end joints) and heavy refrigerator doors, make it air tight. The Patent Interlocking Anchorage System prevents twisting, creeping and warping. The Clear Oregon Pine, from which the staves are cut, gives its inner surface the smoothness of a shot gun barrel.



Let us tell you more about the Simplex and the 25% price reduction. The coupon, mailed today will bring this information.

Lendorris Ranch Polands — Big type Poland Chinas of all ages for sale. The kind that makes weight quickly. Weanling boars and gilts sired by Lendorris Liberator out of Lendorris Liberty Bond sows. Now ready for delivery. W. L. Haag & Son, Hanford, California.

Registered Poland Chinas. 40 tried brood sows; 40 gilts. Some choice young boars all at reduced prices to move at once. These Polands are as good as can be had anywhere at any price. W. D. Trewhitt, Route B Box 47, Hanford, Calif.

Big Boned Poland Chinas—Bred gilts and young boars priced to sell at once. Young stock, either sex, for sale at all times. Bassett Bros., Hanford, California.

Bred Poland-China Gilts sired by California Geratdale and bred to Some Price $75.00 and up. J. A. Crawshaw, Hanford, California.

RABBITS

Pedigreed Flemish Giants — No fancy prices. Maud Beeching, 1578 W. 46th St., Los Angeles.

Guinea Pigs Wanted—Highest price paid. Smith, Route 1, Box 139, Pasadena.

HORTICULTURAL PRINTING

Catalogues and Booklets, office forms and correspondence stationery for the nursery, seed and florist trade; half tone cuts of many standard plants. Correspondence invited. The Kruckeberg Press, 236 Court St., Los Angeles

WANTED

Agricultural College Graduate, single, white, healthy, twenty-eight, experienced with general farming and running tractors and modern farm machinery, wants permanent position where he can learn the orange business and where there is a change for advancement. Write O. S. Kyes, 4517 W. 16th Street, Los Angeles, California.

Wanted—An experienced orchardist with some money for investment to take charge of 170 acres of young Winter Pears with other interested owners. Land near Salinas, Monterey County, on State Highway. Write California Coast Fruit Co., Salinas, California.

Man Wanted —Married man on Jersey herd, first class dry hand milker. Good feeder. To board extra man. Gas, water, bath in house. G. A. Brown, 509 E. Main Street, El Monte, California.

Wanted Job As Foreman on large ranch. Can give reference. Can handle tractors and gas engines, am also good teamster. Have handled lots of men. Glen Barstow, Laton, California.

Man With Years of Experience desires position on ranch as cook; steady; best references. Oscar George, c/o A. H. Reynard, Box 3, Box 181-B, Long Beach.

Wanted—Unsulphured dried figs and other unsulphured fruit. Write for information. Martin A. Witt, 120-122 West Ann Street, Los Angeles.

MISCELLANEOUS

Get Maximum Income from your land by having your irrigation and drainage problems properly attended to by the Engineering Service Company, 1316 Washington Building, Los Angeles, California.

Lumber, Lath, Millwork—Get our direct-to-consumer prices before building. Catalogue, plan book free. Contractor's Lumber Supply Co., 452 Lumber Exchange, Seattle, Wash.

Avoid Law Suits by having your property lines properly surveyed and established by the Engineering Service Company, 1316 Washington Building, Los Angeles, California

For Sale—Golden Persian Pedigreed Kittens. Apply to L. A. Niedermeyer, Lagunitas, California.

FOR RENT

For Rent—960 acres of improved grain land, one-half now fallow. Would like to have tenant take over about $4,000 worth of equipment. A. B. Scheel, Richgrove, Tulare County, California.

PATENT ATTORNEYS

WEBSTER, WEBSTER & BLEWETT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.

LIVESTOCK

Shorthorns, Shropshires, Berkshires, Shetland Ponies, Bronze Turkeys. W. P. Rocks, Butte City Ranch, Box C, Butte City, Glenn County, California

Polled Herefords and Durocs — Diablo Stock Farm, G. W. Emmons, Prop., Danville, California.

EARLY TRACTOR OWNERS STILL USE MECHANICAL POWER

(Continued from Page 99.)

tors; 28 used them for belt work only, while 19 still had their tractors but used them for neither field nor belt work.

Of 80 men who purchased their machines in 1911, 1912 and 1913, 19 still owned the same machines and used them for field work. One of the 19 had purchased another tractor and used both for field work; 38 had replaced their first tractors with others which they used for field work; 25 of this group had sold their first tractors and 13 still had them; of these 8 used their old tractors for belt work only and 5 did not use them at all; 23 did not use tractors for field work; 5 had disposed of their old tractors; 8 used them for belt work only; 10 still owned their tractors but used them for neither field nor belt work.

Thirty-eight, nearly half, of these men who began using tractors in 1913 or earlier are located in the Dakotas. In all, 685 men were no longer using their first tractors for field work; 469 had disposed of their tractors and 216 still owned them; 102 of the latter used the tractors for belt work in 1920 and 114 did not use them at all. Thirty-five per cent of the men who had disposed of their tractors sold them for cash and 65 per cent had disposed of them in trade, usually for new tractors.

The men who had disposed of their early machines paid on the average $990 for them, kept them a little over three years and received $490 for them. Thus the average annual depreciation was a little more than $150.

There was no great difference in the length of time the men in the different states kept their early machines. The Dakota farmers received an average of $665 for the old machines which they had sold, considerably more than was received for old machines in any of the other states. This greater sale value was due in part at least to the fact that most of the early tractors in North Dakota and South Dakota were larger and more expensive than in the other states.

The tractor operator has evidently been partly responsible for the success or failure of these early tractors. Only 11 per cent of the early tractors which were still in use for field work in 1920 had been operated by hired help and only 12 per cent of the men who had replaced their first tractors with others depended on hired help, while 25 per cent of the men who had discontinued the use of tractors for field work had allowed the machines to be operated by hired help.

At the time of making their early reports, 84 per cent of these men believed their tractors would be profitable investments. Eighty-two per cent of those who used their first machines for field work in 1920 still considered that they were profitable, and 83 per cent stated that they intended to buy others when the ones they were then using wore out. Sixty per cent of those who have sold their first tractors and purchased others, and only 32 per cent of those who have sold their first tractors and have not purchased others, consider that their early machines were profitable investments. The men who had purchased new tractors had owned them about 1½ years, on the average, and estimated that they would give about 5½ more years of satisfactory service. Eighty-nine per cent believed that the new tractors would be profitable.

On the average the men who were still using their early tractors for field work had owned them about 4½ years; in this time they had spent $187 for repairs—about $40 per year, and they estimated that the machines would last five years more.

In 1917 and 1918, when these men gave the first reports of their experi-

ence, they had increased their acreage by an average of 14 per cent since the purchase of their tractors, and at the same time had reduced the number of work stock kept by about 20 per cent. There had been little further change either in acreage or number of work stock on the farms where tractors were still in use in 1920.

In many cases the first tractors evidently were not the sizes best suited to the needs of these farmers. In all, 512 of the men reporting had bought their second tractors, either to replace or supplement their first ones. Of these 268, or 52 per cent, purchased the same size as they first owned; 126 purchased larger sizes, and 118 purchased smaller sizes. Four hundred and twenty-nine of the men who were still using their first tractors stated that they intend to buy others when their first ones are worn out, and also gave the size which they intend to buy. Of these, 248, or 58 per cent, intend to buy the tractors of the same size as their first ones, while 103 intend to buy larger sizes and the remaining 78 intend to buy smaller sizes.

FARM IMPLEMENTS MANUFACTURED LAST YEAR

Gas tractors to the number of 203,000, with a total value of $193,000,000, more than 1,000,000 plows with a value of over $40,000,000, 225,000 farm wagons with a value of nearly $25,000,000, and 412,000 haying machines with a value of nearly $25,000,000 were manufactured in the United States during the year of 1920, according to detailed reports from 583 manufacturers, summarized by the bureau of public roads, United States department of agriculture. The total value of implements manufactured was $537,000,000, and gas tractors constituted more than one-third of the total.

These figures are a summary of detailed reports which 583 manufacturers of tractors, farm implements, vehicles, and other farm operating equipment recently gave to the division of agricultural engineering. Every manufacturer of farm equipment in the country was asked for a report of his activities and while a few did not respond it is certain that at least 99 per cent of the entire industry is represented in the figures above, and for most classes of equipment the information is practically complete.

The reports of a considerable number of firms covered fiscal years ending in the latter part of 1920 or the early part of 1921. The reports of such firms do not represent exactly their activities for the calender year of 1920, but in every case the report covered an entire year, and it is believed that for all practical purposes the totals may be considered representative of the industry for the calendar year.

PEAR DAY AT LITTLEROCK

Littlerock, in the Antelope Valley of Los Angeles County, will celebrate its annual Pear Day, August 6. A free lunch, including pear pie, will be served. After lunch there will be a short program of addresses by President Swett of the California Pear Growers, President Nagle of the California Fruit Exchange and Farm Adviser Hodgson of Los Angeles County, followed by a trip through the orchards.

EDEN TOWNSHIP FAIR

Eden Township, Alameda County, proposes to have one real agricultural fair this summer. The dates chosen are August 11-14. Two large tents have been secured for housing the show and the committee reports that already the space is all disposed of.

CANARY ISLAND ONIONS

Onions without irrigation or much rainfall may sound strange to a California grower, but dry farming is the practice in the Canary Islands, whence comes the largest part of the onion seeds used in the United States. Consul F. A. Henry, stationed at Teneriffe, Canary Islands, reports as follows:

"Onions are for the most part grown without irrigation, and are therefore subject to wide variations in yield from season to season. While the rainfall there is light, dry farming methods are used, which permit large crops to be grown with a minimum amount of water. They are grown for the most part in small plats and frequently associated with other cultivations. The only fertilizers used are the limited amounts of animal manures available locally. The fields are prepared for planting by plowing, which is done with a simple form of native made iron tipped wooden plow.

"While there is little or no irrigation in Lanzarote, a kind of 'dry farming' method is employed which makes the most of the limited rainfall and moisture. This consists in placing a layer of a certain kind of volcanic sand obtained from some mountain sides on top of the land which is to be cultivated. This sand, heated by the sun during the day, absorbs moisture from the air during the night, retaining it from the rains for a considerable time. One pound of seed is said to yield 3,000 to 4,000 pounds of onions. An acre under favorable conditions will produce 20,000 pounds of onions."

LIME REQUIREMENTS OF SOIL

Three members of the staff of the Rhode Island agricultural experiment station conducted experiments to determine the chemical and physiological lime requirements of soils.

Experiments were made with lettuce and beet (lime loving plants) in pots containing a normal soil which had received a copious application of nitrogen, phosphoric acid and potash, plus varying amounts of slaked lime. Liming caused an increase in the yield, but after the maximum crop was reached, further liming did not further increase growth, although the lime requirement of the soil was chemically still considerable. The addition of superphosphate to unlimed pots caused an increased growth in lettuce in spite of a markedly increased lime requirement in the soil as determined by chemical examination. This tends to show that the elimination of the effects of alumina in acid soils is of greater importance than the neutralization of the acidity.

HELP PREVENT FIRES

California cannot afford to have so many forest fires, and, if everyone takes hold, can get along without any at all. Visitors to the best of the European forests a quarter of a century ago used to be shown with excitement "our most dreadful fire," a fire covering perhaps a quarter of an acre.

Last fire season 415,275 acres of land were burned over in the forest, brush, hay and grain fires of California, and the total loss was about a million dollars. In the whole United States the forest fire losses last year were about five million dollars.

This is terrible waste, and our children's children will suffer because of it unless everybody takes hold, heart and soul, to end it forever. Nearly all fires are started by human carelessness, indifference and folly. Let us educate the entire community, and above all, the girls and boys, so that we have fewer and fewer fires, smaller and smaller losses, more "baby trees" that become forest giants. — Charles H. Shinn, Forest Examiner.

The house provision for 15 per cent ad valorem tariff on long staple cotton is far from satisfactory to Arizona cotton growers. On the present nominal price of cotton at the gin, it would be equivalent to only about four cents a pound. A fight will be made for 20 cents a pound.

THE DAIRY COW: SHE'S A CASH PRODUCER

In this day of tight money and high interest rates cash is appreciated. The dairy cow is a cash producer; her product can be marketed every day, and there is always a market for her product. The cash now flowing into the country for dairy products is one of the strongest forces at work in stabilizing business conditions.

The safety and economy of diversified farming is now being appreciated, for with it there is always a marketable product and an income in the form of cash. A number of good dairy cows will support a large family and supply the running expenses of the farm with ready cash. Dairy products are now being recognized as our most valuable food since the discovery of vitamines found so plentifully in butterfat. It is hard to estimate the great and essential value of good dairy products. There are few farms that would not be improved by keeping a small herd of dairy cows. Much waste takes place, especially on the crop farm, of such products as straw and forage. This could be turned to a valuable use, add a cash income to the farm and at the same time increase its fertility.

BACK TO THE DAIRY COW AND SAFETY

The lesson taught by the cotton "stampede" may prove a blessing in disguise as far as the future prosperity of the Imperial Valley is concerned. At any rate it points out emphatically the stability of the dairy industry as a steady producer. Cotton, wheat and rice crops may fail but the old dairy cow keeps on giving milk and bringing in a cash return to her owner with unfailing regularity.

Farmers, merchants and bankers throughout the length and breadth of the land are beginning to realize that diversification of crops keeps business on an even keel and that the dairy cow plays a mighty important part as a stabilizing factor. Milk and its products are the equivalent of cash and good cows, proper feeding and headwork always show a profit in the dairy business. The element of risk in dairying has been practically eliminated by the simple process of weeding out the boarder cows and retaining only those which produce milk in paying quantities. The work of the cow testing associations in progressive dairy communities has placed the industry on a business basis.

OAK LEAF POISONING

Bulletin 767 of the United States department of agriculture states: "Although there is an abundant literature on poisoning caused by acorns, very little is recorded on poisoning due to oak leaves, and for this reason the authors took up the subject. The experiments were carried out on cattle, using the leaves of the scrub oak (Quercus Gambellii) and the following facts were observed: Continuous feeding with oak leaves may produce a disease which sometimes ends fatally. In a herd feeding on the same pasture only a few animals are affected. The most obvious symptoms are constipation, mucus and blood in the excreta, emaciation and oedema."

Use a good sire. Without a good sire improvement in the herd is impossible.

The dairy is a factory, and like all factories, the larger the production of each machine (the individual cow) the lower is the cost of production.

The individual cow is the foundation of dairying.

Royal I Am

This great senior yearling Duroc - Jersey boar owned by Sierra Vista Ranch, Perris, is going to be a strong contestant for championship honors at the shows this fall.

Time alone is the great testor

As the sands run through the glass of life the things that are real abide while the the unworthy pass away.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Farm Loan

Where is application made for farm loans and how are they obtained under the federal act? — Subscriber, Azusa.

Under the federal farm loan act the United States is divided into 12 districts, known as federal land bank districts, in each of which is one federal land bank. This central bank may establish branches throughout the district. The land bank which is in the district that comprises the state of California is located at Berkeley. Subordinate to the land bank, the act requires that farm loan associations be organized by parties desiring to borrow money, each of which shall be erected as corporations and composed of ten or more persons who are land owners and desire to avail themselves of the provisions of the act. The articles of incorporation of the association must be forwarded to the land bank; an appraiser of the land bank thereupon investigates the solvency of the applicants and the value of their lands. The land bank thereupon passes upon this report and forwards the same to the federal farm loan board at Washington with their approval or rejection. If approved, a charter is granted to the applicants as a corporation, designating the territory within which they may make loans. The loans under the act are made by this association to its members. In order for the association to make such loan it must subscribe to capital stock of the land bank to the extent of five per cent of the loan. Any person desiring to borrow money must make application to the farm loan association for membership and subscribe to stock of the farm loan association to five per cent of the principal of the loan desired; this subscription is paid off and retired on full payment of the loan. When application for a mortgage is made to the association it is referred to the loan committee, which must examine the land, appraise it, and make written report. The board of directors of the association thereupon pass upon the loan and, if they recommend that it be made, all papers are referred to the land bank. An appraisal may be made by the bank appraiser and the bank thereupon passes upon the loan. If favorable, the money is advanced to the association which thereupon makes the loan upon receiving the first mortgage on the property.

Collecting Note

A note for $100 for money loaned, bearing interest, payable in one year was given. Part of the interest was paid. In 1921 a new note was given payable in six months. The maker is unable to pay. Can the payee sue and require maker to pay costs? The maker has a Ford, farm machinery, and a team of horses in which another party has a share.—Subscriber, Pond.

Undoubtedly the payee can obtain judgment and levy execution on the interest which the maker of the note has in the Ford; the team of horses is exempt from execution, and possibly the farm machinery, depending upon what it is and its value.

Descent of Property

A woman, married, with no children, dies. Her sole kin are the husband and one sister. How can the sister ascertain the amount of the estate left or if a will had been made? How does the property descend? Does the same rule of succession apply in all states?—Subscriber, Modesto.

The estate must be probated within the county within which the party dies. This rule is general throughout the country. If there is a will it must be proved within the county. Information as to these points could be procured from the county clerk. In this case, in the absence of will, the separate property would descend one-half to the surviving husband and one half to the sister. The rules of succession are not necessarily the same in all states.

Poultry Queries

(Conducted by Jean A. Koethen)

Chicken Pox

Chicken pox has just appeared in our flock and I would like to head it off. We have sprayed the house and disinfected the water but still it spreads. What is a good preventive in addition to perfect cleanliness?—Subscriber.

You should write Poultry Division, University of California, Berkely, California, in regard to vaccination. If you have a large flock and the hens are kept in units of 100 or so, it may be you will only need to vaccinate the hens in the yards where there have already been cases. Sulphur in the mash, one pound of sulphur to 50 of mash, is sometimes recommended as a preventive, but vaccination has been generally successful in this state and is probably the more certain remedy.

Weasel or What?

Some small animal has dug under the coop and killed nearly all my chicks by eating holes in their heads. They seem to be safe after they are large enough to roost. I see no signs of rats.—Subscribers, Palmdale.

Perhaps it was a weasel. A cement floor built several inches above the ground all around is the best protection against depredations of this sort. If you cannot manage this try a very tight board floor.

Too Much Corn

My pullets 5½ months old are dying. On examination I find the liver greatly enlarged, covered with yellow blotches and very soft. I feed scratch consisting of 1 1/3 parts wheat, 1/3 part corn, 1 1/3 parts milo and growing mash consisting of 17 per cent protein, 5 per cent fiber and 11 per cent ash. They have a yard 50 by 60 feet planted to barley for 100 pullets.—Subscriber, Lankershim.

That enlarged liver tells the story. The ration you are using is too fattening for hot weather, and if you are depending on growing barley for greens I suspect your pullets are suffering from lack of green feed as well. Poultrymen in your district say they cannot feed much milo in summer. If you should omit the milo and put barley in its place I think you would not need to drop the corn provided it is cracked. Whole corn is especially fattening. The pullets are too old for a growing mash. Let them have a laying mash and put their energy into making eggs. Give plenty of green feed—alfalfa is best for summer—and make them scratch for every bit of grain they get. You do not say how much grain you are feeding 100 pullets each day, but from six to seven quarts is sufficient. Make them eat more mash and they will lay more eggs.

Swellhead

During the spring and early summer I noticed some of my chicks with eyes swollen, at times entirely shut. On examination I found matter resembling milk curd but more solid and varying in size from a small pea to a dime. When this was removed the chicks were all right.—Subscriber, Orland.

What gave these chicks swellhead, I wonder? Did they roost in a coop where they had not room enough and then take cold when they came out into the chill morning air or was it merely lack of ventilation? Chicks do not have swellhead (which is a form of roup) if they have been kept under perfectly sanitary conditions—clean coops, fresh air, plenty of room inide and out, and a chance to run. Cleaning the eyes with boric acid is all the treatment required if the cause is removed.

SOUTHERN CALIFORNIA EGG-LAYING CONTEST

Southern California farm bureaus have united with the Poultry Producers of Southern California in planning for and financing an egg-laying contest which will begin October 1, at Pomona.

Those intending to enter birds should forward entries without delay as the number of entries will be limited to 50 and it will be "first come, first served."

Entry blanks can be obtained from G. E. Gordon, Room 361 Court House, Los Angeles; from L. A. Brooks, Secretary of the Poultry Producers; from M. A. Schofield at Gardena; from E. J. Houser, at Fontana; or from C. G. Ross or C. E. Bayer, secretary of the chamber of commerce, at Pomona.

At the special meeting of the stockholders of the Poultry Producers of Central California, on July 14 at the office of the association in San Francisco it was decided to increase the capital stock to $750,000. There was also informal discussion of an educational campaign to more thoroughly acquaint the members with the principles of cooperation. General Manager J. H. Barber writes: "Subscriptions to the amount of nearly $15,000 have already been accumulated by deduction from egg shipments, and it will not be long until we have secured by this means a substantial addition to our working capital, which will be very welcome."

California Farm Bureau Egg Laying Contest

By Prof. J. E. Dougherty

FOR the 30 days of June the contest flock averaged 62.7 per cent, or 19.1 eggs per hen. Hanson's pen still holds the lead, with Hollywood Farm, Geo. Gray and S. L. Gibson still holding second, third and fourth places respectively as in May, but W. A. Ford's pen has forged ahead into fifth place and forced Marshall back to sixth place. The total production since November 1 has averaged 54.5 per cent for the contest flock as a whole.

The line-up to date follows: Hanson's Poultry Farm, Corvallis, Oregon, 1,723 1/3 eggs; Hollywood Farm, Hollywood, Washington, 1,654; Geo. Gray, Santa Cruz, 1,643; S. L. Gibson, Santa Cruz, 1,625 1/3; W. A. Ford, Umatilla, 1,622; W. H. Marshall, Santa Cruz, 1,616; Gibson, 1,537 1/3; R. J. Kenter, Santa Cruz, 1,509 1/3; Santa Barbara Poultry Ranch, Santa Barbara, 1,507; Gibson, 1,470.

Among the high individuals to date, Hollywood's hen is still leading with 201 eggs to her credit, but Lehman's hen has dropped to sixth place and hen from the La Rita Farm has moved up into second position with Conrado's hen third and Hanson hen fourth. The ten high hens to date are: Hollywood, 201 eggs; La Rita, 192; Conrado, 192; Hanson, 190; Hollywood, 189; Lehman, 188; Oregon Ag. College, 188; Crewdson, 186; Hanson, 186; Brenneke, 186.

June records produced a general shake-up in the monthly standings of the various pens. Alex Stewart jumped from sixth place in May to first place in June. S. L. Gibson moved up to second from fifth place, forcing out Geo. Gray, who dropped to third position which was held last month by pen of D. B. Walls.

The new line-up of leading pens for June follows: Alex. Stewart, Santa Cruz, 230 1/3 eggs; Gibson, 228 1/3; Gray, 226 2/3; Ford, 224 2-3; Ed Butler, Oakland, 221; D. B. Walls, Petaluma, 219 2/3; W. J. Neef, Santa Cruz, 218; J. S. Conrado, Santa Cruz, 217; Geo. Wood, Santa Cruz, 217; Wood, 215.

During the month Oregon agricultural college Barred Rock jumped into the lead as the highest June layer with a final total of 28 eggs in 30 days. Four others tied for second ribbon with a production of 27 eggs, and ten more tied for third position with a yield of 26 eggs each.

The high hens for June follow: Oregon Agricultural college (Barred Rock), 28 eggs; La Rita Poultry Farm, 27; Walls, 27; Dr. C. K. Hale, Santa Cruz, 27; Hale, 27; Gray, 26; Gibson, 26; Hanson, 26; Harry Beernink, Lynden, Washington, 26; C. E. Hyde, Seabright, 26; Oregon agricultural college, 26; H. C. Klinesmith, Hoff, Oregon, 26; N. C. Westerfield, Modesto, 26; Walls, 26; La Rita, 26.

Hen in Chas. Lehman's pen has been running the leading hen a close race for the past few months but evidently couldn't hold off her strong maternal instincts for sport's sake any longer, for she went broody this month and has dropped back to sixth place. The first hen to hit the 200-egg mark was Hollywood hen No. 54, which laid her two hundredth egg June 29th. Many more will cross the 200 line and begin advancing toward the 300 mark before July is past.

All birds, unless otherwise indicated, are S. C. White Leghorns.

Fractional figures in pen yields are due to floor eggs being equally divided between the three entries in each pen.

Poultry Producers Annual

The stockholders' meeting of the Poultry Producers of Southern California will be held on August 3 at the office of the company, 1560 Industrial Street, Los Angeles. The management is urging members who cannot come to have proxies in hand of the secretary at least five days prior to the meeting. Two-thirds of the stockholders must be present.

In a recent membership letter Chairman Ross of the executive committee writes "About Ourselves."

"The growth of our organization since 1917, when we started with 120 shippers and an initial pool of 10,449 dozens of eggs, may be briefly indicated by stating the maximum number of shippers in each year, and the number of dozens of eggs in the largest pool of that year.

"In 1917 we reached a maximum of 442 shippers and our largest pool was 99,253 dozens of eggs. The following year brought a decrease in the number of shippers and the maximum pool was only 83,268 dozens. The next year, 1919, brought a material increase in the number of shippers over the previous year, but the increase came late in the season and the maximum pool was about the same as in 1918.

"In 1920 there was a rapid increase in membership. We were receiving eggs from a maximum of 538 shippers, while the largest pool was 128,477 dozen, an increase of over fifty per cent above the previous year.

"The present year began with 430 shippers, but this has increased rapidly until we are now receiving eggs from about 650 shippers, and our maximum pool was number 18, when we received 152,328 dozens of eggs.

"During these years there has been a wide fluctuation in the market for fresh eggs and our pool prices have reflected this accordingly. In 1917 the range was from a minimum of 25 cents to 57.55 cents; the following year the lowest pool returned to members was No. 15 when the price was 35.61 cents. This steadily increased until pool No. 45 was 80.61 cents. The next year, 1919, had a minimum of 36.19 cents and a maximum of 81.02 cents; last year the minimum pool was No. 12 at 38.85 cents, while the highest pool yet paid our members was No. 45, when we returned 84.54 cents. These figures are the 'Pool Prices' as given on the statements sent out with the remittances."

DON'T

Don't ship "dirty" eggs during the non-storage season, but clean all soiled or dirty eggs carefully.

Don't pack two grades of eggs in the same filler.

Don't pack your washed eggs with those which are unwashed, but separate them and mark all washed eggs with the special colored slips provided for that purpose.

Don't ship any eggs without grading. Pack the "Extras," "Pullets" and "Pewees" separately, and if less than a full case mark each with a slip of paper.

Don't guess at the weight when in doubt as to grade; use your scales.

Don't handle a bucket of eggs like you would a box of "spuds"; remember eggs are fragile and every time you set your bucket down on the ground, unless you are extremely careful, you will crack one or two, and so reduce their value.

Don't leave a bucket or a case of eggs in the sun for even five minutes, because it does them harm.

Don't store your eggs in a warm place, a dirty or dusty place, or where they are subject to currents of air, as this will make "seconds" of a first class article very quickly.

Don't permit your nests to get filthy, but keep them well filled with clean planing mill shavings. Attend to this regularly.

Don't expect to receive returns for "Extras" unless you are delivering "Extras." The same applies to other grades as well.

HAY AND FEED

Alfalfa Growers of California state that prevailing prices f. o. b. S. F. are:

No. 1 Dairy	16.00
Standard	14.00

Under wate of July 23, A. W. Scott Co. says:
Receipts, 1,706 tons compared with 1,539 tons last week. Probably the local market is at as low an ebb as it will reach during the season. Consuming demand is less than ever has been known in San Francisco. Alfalfa is still decidedly off, with consumers buying not more than a few days' supply at a time. Mill feeds are unchanged, with demand reduced to its very lowest.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of switching, cartage, commission and handling expenses must be added according to conditions).

Citrus Markets

Los Angeles, July 27, 1921.

Oranges are going forward rapidly, sometimes reaching as high a shipment as 200 cars daily. As a rule, however, totals do not exceed 100 to 150. Large size fruit has advanced slightly from quotations last week. Market for small offs is rather weak.
The spectacular phase of the lemon market has been eliminated, but very strong condition still exists. There are now some 70,000 boxes of foreigns in transit or in dock.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 32,277 cars; lemons, 9,271; total, 41,548. To same date last season: Oranges, 25,725; lemons, 6,494; total, 32,219. From Central California to date this season: Oranges, 6,637; lemons, 212; total, 6,849. To same date last season: Oranges, 5,377; lemons, 289; total, 5,666. From Central California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

CATTLE MARKET SITUATION

The Chicago market has again improved during the past week approximately one-half cent, while the Portland market has held steady, as well as the San Francisco and Los Angeles markets. Receipts at Chicago have been approximately the same this week as last. Sales in California are reported from northern, central and southern points at 6¼ cents for steers and 5 to 5¼ cents for cows. These sales have all been f. o. b. shipping points and have been sent to Sacramento, San Francisco and Los Angeles markets. Information from 60 market points in the United States shows that the number of feeders sent to market during the first six months of this year has decreased 25 per cent from last year's figures.

The following list shows the number of cattle sent to market the first six months of this year from additional counties not listed in the last market report: Lassen County, 3,489; Modoc County, 4,220; Plumas County, 533; Shasta County, 2,776; Marin County, 135; Mendocino County, 217; Sacramento County, 1,541; Solano County, 1,584; Sonoma County, 602; Placer County, 1,516; San Francisco County, 30; San Mateo County, 71; Santa Clara County, 5,756; Santa Cruz County, 46; San Joaquin County, 1,554; Orange County, 838; Riverside County, 876; San Bernardino County, 1,226; San Diego County, 331; Santa Barbara County, 5,529.

Do not offer half fat cattle for sale. Market only prime beef.—R. M. Hagen, Secretary, California Cattlemen's Association.

IT PAYS TO CLEAN UP SQUIRRELS

Horticultural Commissioner Alley of San Luis Obispo County writes:

"The first week in July the U. S. government biological survey started poisoning the government lands in the southern part of Monterey County. The crews will move south and poison the Coast Range in San Luis Obispo County and if they have sufficient funds left will poison the Pozo and Avenales country.

"Last year the government had no crews at work in the county. The poisoning of government lands was done by the rancher whose land joined the forest reserve with poisoned grain furnished by the survey and under the direction of the county horticultural commissioner.

"Does it pay to clean up squirrels on property owned by an absentee and rented at 20 cents an acre? A 500 acre field near Templeton was treated with poisoned grain last year at 40 cents per acre. This year the owners had the land gone over with carbon bisulphide. Result: When the job was finished a nearby rancher wanted to rent the piece for $1 per acre.

"As the land is situated in a district where a gas campaign was carried on this year, the owners will begin to receive returns on their investment, as the district is squirrel free."

A year ago a bushel of oats bought three gallons of gasoline; today it buys one gallon. A year ago a ton of coal could be bought with four bushels of potatoes, while today it takes 57 bushels of potatoes to buy a ton. Hides and wool have gone begging for some months, yet look at shoe prices and many garments. They surely can't complain that the farmer hasn't stood the giant's share of loss taking—Holstein-Friesian World.

Alfalfa Weevil Quarantine

EVERY official of the state department of agriculture has watched with dread the gradual spread of alfalfa weevil in states to the eastward. So far as known not one of the pests has yet entered California, but they have been intercepted at the boundary line and the infestation has reached to the very gateways of the state. Campers and others driving into California and coming through the infested regions have no knowledge whatever of the deadly nature of the pest and have purchased bales of hay in infested districts and loaded in their wagons and driven straight for California. The seriousness of the siutation has made necessary Quarantine Order No. 34 from which we quote:

"The fact has been determined by the director of agriculture that an insect injurious to alfalfa and other forage and cover crops, known as alfalfa weevil (Phytonomus posticus, Gyll.), new to and not heretofore prevalent or distributed in the state of California, exists in the states of Utah, Idaho and Wyoming, and in certain counties in the state of Colorado, to-wit: Delta, Gunnison and Montrose, and in certain counties in the state of Nevada, to-wit: White Pine and Washoe, and in a certain county in the state of Oregon, to-wit: Malheur, all of which being hereinafter designated as infested territory, and that alfalfa hay and other hay and cereal straw, alfalfa meal, alfalfa seed, salt grass packing, baggage, emigrant movables, household effects, household implements, camping effects, camping implements, livestock, potatoes, nursery stock, used alfalfa meal milling machinery, and all machinery, implements, bags and other containers, that have been used in the milling, baling, harvesting or threshing of alfalfa, railroad cars, automobiles, automobile trailers, trucks and other vehicles are liable to be carriers of said alfalfa weevil into territories otherwise free from this pest;

"Now, therefore, it is declared necessary, in order to prevent the introduction of said alfalfa weevil into the state of California, that a quarantine be and the same is hereby established at the boundaries of the state of California, in accordance with the provisions of section 2319b of the political code of the state of California, against said alfalfa weevil, all alfalfa hay and other hay and cereal straw, alfalfa meal, alfalfa seed, salt grass packing, baggage, emigrant movables, household effects, household implements, camping effects, camping implements, livestock, potatoes, nursery stock, used alfalfa meal milling machinery, and all machinery, implements, bags and other containers that have been used in the milling, baling, harvesting or threshing of alfalfa, railroad cars, automobiles, automobile trailers, trucks and other vehicles from said infested territory except as hereinafter provided."

There is a series of ten regulations providing that under certain conditions of inspection, fumigation or proof of harmless nature of the shipment the alfalfa hay, seed, packing grasses, potatoes and other feeds, nursery stock, household goods, etc., may be allowed to enter the state.

As showing necessity for extreme care at the state line we note the following in weekly letter of the state department of agriculture.: State quarantine officers stationed at Nevada state line found live alfalfa weevil in the bedding of an auto camper on July 10. "The accupants of the automobile in which the weevils were found had camped in the auto camp at Sparks, Nevada, and had cut alfalfa to place under their blankets for a bed. A careful inspection of the blankets at State Line brought to light a few stalks of alfalfa and the accompanying weevil. This occurrence illustrates in a graphic manner the possibility of introducing injurious insects through the medium of automobile transportation and proves conclusively that commercial shipments do not constitute the greatest problem in the enforcement of quarantine regulations."

COMING EVENTS

FINE LIMESTONE IS THE BEST

To secure best results limestone that is used for soil improvement should be finely ground. Experiments have shown that when everything is considered it is best to use material that is pulverized fine enough to pass through an eight mesh or ten mesh sieve. The Missouri college of agriculture, through P. F. Schowengerdt, soil specialist, cautions farmers against using coarser limestone unless it is applied in such large quantities that sufficient fine material will be supplied.

It will not be profitable to use the coarse limestone and apply larger amounts unless it can be purchased for considerably less per ton than the correct size would cost. This is true because, if only three-fourths of a given quantity of material will pass through the eight mesh sieve, it will be necessary to purchase, haul and spread about one-third more ground limestone in order to get enough on the soil to produce the desired results.

COST OF RAISING ALFALFA

The Alfalfa Growers Association of California has been collecting actual figures as to cost of production of a ton of alfalfa in various alfalfa raising sections of the state. Here is statement of cost of production in the Riverside district, one of the important alfalfa districts in the southern part of the state, which produces almost exclusively hay for marketing; this particular ranch confines itself altogether to it. It is managed very efficiently and its hay has the highest reputation for quality. The figures are taken from its last year's accounts and therefore show actual results, not estimates: Size of ranch 250 acres:

Interest on investment, $6,178.50, $24.71 per acre.
Taxes, $2,390.23, $9.56 per acre.
Water, $2,739.53, $10.96 per acre.
All other expenses, $32,081.86, $128.32 per acre.
Total, $43,490.17, $173.55 per acre.
Total production 1,759.56 tons.
Cost per ton, $24.77 f. o. b. cars.

Civilization is a state of human development that moves a man to pay the laundry for destroying his collars. —Toledo Blade.

EUCALYPTUS STUMPS

A South African asked how he could most easily remove large eucalyptus stumps and his government forester answered as follows: "The method generally followed in these cases is during winter to bore holes (the number varying according to the size of the tree. Bore the holes downward to a depth of 12 to 18 inches. The agent used may be saltpeter, equal parts of nitric and sulphuric acids, or arsenate of soda. The former method is the safest. Place an ounce to two ounces of saltpeter in the hole, fill up with water and plug the hole. The following spring pour in a little paraffin and set alight and the wood will smolder away to the roots."

The newly appointed national radio service commission at its organization meeting last week with Postmaster General Hays outlined a plan for distributing crop information by means of wireless telephones, perhaps fitted with amplifiers so that large audiences may hear the reports at banks, county agents headquarters or other selected centers.

KILL Red Spider

Dust Your Orchard With The American Beauty Dust Sprayer

During the hot summer months Red Spiders increase, destroying your crops and lowering the vigor and vitality of your trees. Dry Sulphur, with a temperature of 75 degrees or over, will kill them in a few hours, and if properly applied—with the American Beauty Dust Sprayer—will not burn the trees. The machine is operated by one man and places the dust only where needed and in its most efficient form. In orchard work 15 acres a day may be covered, with larger acreages in field or vineyard.

Let the SUN give you plenty of HOT WATER

DAY & NIGHT

SEEMS impossible, doesn't it: But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home—mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept. E.

Busy Scenes Where Cooperation Is

TO dispose of the fruit or not is one burning question with many California fruit producers. Last year it was not under consideration for before the producer was aware that harvesting time was approaching he was approached and a price made for his crop which made an immediate bank account possible, though, unfortunately, some agreements made as to f i n a l payments were never completed, for markets went bad and in some extreme cases the accounts were never closed. There were something like 1,500 people in California, however, who were not so seriously concerned. These were cooperators who had placed the canning and the marketing of their product in the hands of others.

These 1,500 people comprise growers who are members of two great cooperative canning concerns, one operating in the northern part of the state, and the other in the southern. The California Cooperative Canneries has its headquarters at San Jose, while the California Growers have offices in Los Angeles. These two canneries handle about 30,000 tons of fruit with value of, say, $25 per ton on the open market, but given an increase of at least 50 per cent because of the members placing the canning and marketing in the hands of one organization. This v a l u e to the grower is not large but good in that the return is sure, for it appears that all cooperative canneries, unless possibly one, will operate this year. Of the privately managed concerns hardly 50 per cent will open.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

That busy scene is at Ontario. It is one of the five canneries operated by the California Growers Association, a non-profit organization made up of growers of California fruits, with five canneries located at Ontario, Hemet, Riverside, Fallbrook and Santa Ana, whle the California Cooperative Canneries has plants at Visalia, Tulare, San Jose and Modesto, under the general management of Vernon Campbell, while those in the South are managed by his brother, J. A. Campbell.

* * *

The one big lesson which these cooperative canneries are instilling into the minds of the members, at least—and we hope we may pass the word on to others—is that of security. Many a grower this year has been confronted by this situation: "Is it possible to get a buyer for my fruit at any price?" and not, "Can I get a satisfactory price?" The cooperator has not had to discuss this question; his own cannery, created by himself, gives him assurance that his year's work will not be entirely in vain. But in addition to that it now appears that the cooperator is reasonably well assured of at least 50 per cent more for his product than if he enters the open market, compelled to sell it in a fresh state.

* * *

An Eastern exchange suggests: "Every dairy farm should have a silo, and every farm that can afford a silo can afford a bathroom."

* * *

News headline: "Finds Money in Orchard." Lots of Cultivator readers are engaged in just that occupation. The trouble this year is that it takes a lot of digging to get it out.

* * *

Florida reports an everbearing orange tree. In habit it is similar to the lemon in that it carries flowers, small fruit and fully ripened fruit all at the same time. This everbearing tree is about 15 years old but its origin is a mystery.

GETTING ACTION

Californians are uniting — and effectively—in the tariff fight. The house hasn't treated western producers with justice, and the fight is being carried into the senate. It is true of wool; it is true of cotton; it is true of our fruits and nuts; it is true especially of poultry and eggs. At a recent meeting of the board of directors of the chamber of commerce in Los Angeles the fullest endorsement was given to the fight of Californians, and the schedule which California producers are working for was fully endorsed. The following gives some of the figures for which the California delegation now in Washington is working:

Citrus: oranges and grapefruit, 1 cent; lemons, 2 cents. Beans, other than Limas, 2½ cents. Almonds, unshelled, 5 cents; shelled, 15 cents. Walnuts, unshelled 4 cents, shelled 12 cents. Marmalade, 30 per cent ad valorem. Cotton, 1⅜ inch staple, 15 cents. Poultry, eggs per dozen, 12 cents; dried eggs, 36 cents pound, frozen, 15 cents; dressed poultry, 7 cents; live poultry, 4 cents. Olives: 70 cents per gallon olive oil bulk, 80 cents per gallon five gallon can or less, 20 cents per gallon non-edible oil, 25 cents per gallon olives in solution, 6 cents per pound olives not in solution.

CALIFORNIA STILL LEADS

California still leads so far as can be determined by figures yet released by the census bureau. We have one and perhaps two counties which exceed all others of the United States in value of crops. As may be recalled, in our issue of April 2 preliminary figures were given showing a crop production in Los Angeles County of a value of $62,212,843. Corrected figures given below, received within the last few days, indicate very slight reduction. At that time Aroostook County, Maine, was given second place with $52,541,205. Corrected figures are not received, but since that time Fresno's figures, which are the final and correct ones, are at hand and show that county to have a production of crops aggregated in value $51,861,252.

The value of all crops produced in the various counties of California during the year 1919 is given by the following compiled from the most recent bulletin issued by the department of commerce in its fourteenth census of the U. S.. These are final and corrected figures. They do not include any returns from sale of livestock or livestock products:

Total for state....	$587,600,591
Alameda	8,632,929
Alpine	83,742
Amador	682,186
Butte	11,582,730
Calaveras	593,610
Colusa	13,240,785
Contra Costa	10,044,871
Del Norte	358,355
El Dorado	867,083
Fresno	51,861,252
Glenn	11,571,013
Humboldt	4,082,555
Imperial	17,200,734
Inyo	1,503,195
Kern	6,085,421
Kings	11,940,369
Lake	1,619,428
Lassen	2,104,934
Los Angeles	61,366,608
Madera	4,697,938
Marin	1,452,334
Mariposa	260,064
Mendocino	4,124,824
Merced	13,288,914
Modoc	2,564,901
Mono	219,686
Monterey	9,593,270
Napa	4,722,663
Nevada	399,461

Ventura	18,320,324
Yolo	14,927,215
Yuba	2,072,118

STATE CONTROL, DEVELOPMENT AND DISTRIBUTION OF HYDRO-ELECTRIC ENERGY AND WATER

As we noted last week, announcement is made as to an initiative campaign to place on the ballot a constitutional amendment providing for state control, development and distribution of hydro-electric energy and water.

The measure is known as the California water and power act. Among those who have participated in drafting it are: Rudolph Spreckels, San Francisco financier; S. C. Graham, Los Angeles; William Kent, former congressman; W. B. Matthews, attorney for the Los Angeles board of public works; L. L. Dennett, counsel for the San Joaquin Valley irrigation districts and representing San Joaquin counties in the state senate; Clyde Seavy, city manager of Sacramento and former chairman of the state board of control; Dr. John R. Haynes of Los Angeles; Dr. Horace Porter, mayor of Riverside; William J. Locke, executive secretary of the League of California Municipalities and city attorney of Alameda; E. G. Scattergood, engineer of the Los Angelees power bureau; Louis Bartlett, mayor of Berkeley; William Kehoe, former state senator; Esto Broughton, assemblywoman of Modesto; Franklin Hichborn, Santa Clara; Francis J. Heney, Los Angeles; Charles W. Cleary, assemblyman from Tulare County; Albert Braunschweiger, member of the Riverside board of public works; Senator William J. Carr, Pasadena; J. L. Matthews, Covina, member of the state water commission; J. P. Mallon of Colusa and Oakland; Judge D. J. Hall, city attorney of Richmond and chairman of the legislative committee of the League of California Municipalities.

The committee took advantage of the provision of the law which assigns the state legislative counsel bureau to the work of drafting legislation, and this bureau gave material assistance in preparing the amendment.

The measure, as it stands, is the result of combined efforts on the part of agricultural interests and the municipalities to unite all the elements of the state that are concerned in the development of cheap hydro-electric power and the distribution of water for irrigation and domestic purposes.

The foundation of the amendment is a provision placing the credit of the state behind community development and enabling municipalities and water districts to pay for the construction by returns from water and power developed, without additional taxation, or bonded indebtedness on land, and with the lowest possible rates to users.

The statement follows:

"The California Water and Power Act will enable the people of California to develop and use their own water and power. The necessity of state action has been indicated by public bodies which have investigated and reported upon the underlying problem of water and power shortage. The state railroad commission, in a special report to the governor, in which it summarized the findings of the water emergency conference, estimated that $1,500,000,000 must be spent in California on hydro-electric and irrigation development in the next ten years. Estimates by representatives of the power companies, as to expenditures necessary for the ten year period, vary from $1,000,000,000 to $2,000,000,000. Private companies are endeavoring to finance this work on the basis of interest rates from two to three per cent higher than rates which the public would have to pay under this amendment. In its report to the governor the railroad commission said:

" 'We believe that the time is past when the state as a whole can afford to sit by and wait for the spasmodic development of its resources by individuals. The problem, as a whole must be solved by the state as such, and it is our thought that now is the time for a comprehensive program to be outlined. This the state can do through its power in the enactment of laws and its ability to aid in financing.'

"The men who have associated themselves together in this undertaking believe that this statement of the railroad commission was warranted. They believe that the measure now offered answers the need suggested by the foregoing, inasmuch as it provides a comprehensive program, the enactment of a law and a provision for state aid in financing.

"In preparing the proposed amendment, the committee procured the services of attorneys, financiers, legislators, economists, public officials, engineers and publicists in all parts of California. It enlisted the cooperation of men who are representative of a wide diversity of public opinion and economic interest, so that the final draft would be genuinely responsive to public needs.

"The ends sought by this measure are:

"To place the credit of the state behind public development and use of hydro-electric energy and water, at rates which will attract population and industry to California and supply consumers at the lowest possible cost.

"A system by which development will keep pace with demand and by which construction will be paid for out of water and power earnings, without additional taxation.

"Immediate and permanent relief from water and power shortage, stagnation, waste, and high rates now paid by householders, farmers and manufacturers.

"An aggressive campaign to procure the necessary signatures on the initiative petitions and to place the measure on the ballot in November, 1922, has already begun. The campaign will be directed by a committee which will, to the greatest possible degree, be representative of all groups, sections and interests. This is not an urban or rural or northern or southern movement. It is a California campaign, in which all the people of California are urged to join. Campaign headquarters are being opened in San Francisco, Sacramento and Los Angeles, and the petitions will be immediately circulated. (Signed) William Kent, William Kehoe, Horace Porter, John R. Haynes, Rudolph Spreckels, L. L. Dennett, William J. Locke."

California Cultivator

Vol. LVII, No. 6 Los Angeles, August 6, 1921 One Dollar Yearly

Let's Pull Together

By A. Layman

CALIFORNIANS are proud of their highways. We believe they take greater pride in them—and we are sure they take greater comfort—as they spin along pointing out the wonderful beauties with which the state has been endowed, than in any other improvement or public effort which the people have made. It is a common boast: "Come to California and we will take you for a spin every day for 30 days and each day over a new route of perfectly smooth highways of easy grade."

The state began this building a little less than a dozen years ago, and there have been built about 3,250 miles of graded and paved highways. California pioneered in this work and, the experience of others not being available, our own experience school had to be established. That school has shown that the work of the first few years resulted in many mistakes. The commissioners in charge of the work took advantage of the lessons of those mistakes and changed many specifications as to thickness, breadth, reenforcing and other methods of construction.

Many of the sections were built with the knowledge that construction was purely temporary and to meet immediate transportation needs. It has been asserted that the saving to the producers of the state has been greater during every one of the past few years than the entire cost of the highway system, that is, had the greater costs and the destruction to perishable fruits continued as under the old system of roads. The demand was insistent from every section: "We must have roads to get our products to market." State and county officials vied with each other in this building campaign and roads were extended as rapidly as possible. This work was so successful that it was a common remark of the autoist: "There is no danger of exceeding the speed limit in our cities; we can always tell when we pass municipal and county boundaries for we run onto bad roads." The cities have been grievously slow in the good roads building campaign.

Definite figures as to use of the highways by autos and heavily loaded trucks, made some years ago and recently, prove conclusively that the increase in wear on the roads has been beyond the imagination. It is sometimes asserted to have been thousands of per cent, and the best judgment of the best engineers under those circumstances has naturally proved at fault. But the first to see the errors of the lighter and more extended construction were the very engineers who planned it. This increase in use of the roads, especially by trucks loaded, including truck weight, to 12 or 15 and sometimes 20 tons, maintaining speed of 20 or more miles per hour, has pounded the roads so terrifically that some of them have gone to pieces, and this regardless of whether state, county or municipality had charge of the construction. On this point we will quote from "Have a Thought for the Road," an appeal made by M. L. Pulcher, vice-president and general manager Federal Motor Truck Company. This address had nothing to do with California roads; it was purely the talk of a truck builder with other truck builders:

"One of the largest office buildings in the world was recently erected in Detroit. An immense amount of yardage of earth had to be removed quickly. Result, contractors insisted on every truck hauling an overload. Three and one-half ton trucks carried five or six tons; five and six ton trucks were forced to load to eight and ten tons. Result, the absolute destruction of about 20 blocks of heretofore adequate pavement on one street. No truck on this job was sufficiently tired for the loads it carried. So the pavement was pounded into debris in a few weeks. Result, a more drastic ordinance, but surprisingly fair in view of the destruction caused by the penurious contractors who were willing to spend the public's money for new roads and the truck owner's money for repairs to put a few dollars in their own pockets.

"This story has been duplicated many, many times all over the country. The truck owner is not always wholly to blame although he is in the end responsible."

The school of experience has proved valuable to the engineers and to the whole state. The commission has changed its methods to meet conditions which did not exist a half dozen years ago. So far as possible repair of any defective section has been made. More funds were needed for that work.

One step was to present to the last legislature draft of a bill providing funds for highway upkeep. A strong fight was put up against this measure by both of the big auto clubs of the state, and it was defeated. The auto clubs say that in defeating it they have saved to the auto drivers of the state millions of dollars. This is doubtless true, but auto drivers who take satisfaction in this information should also bear in mind that the saving of this money has been at the expense of efficiency. If this loss to the fund is offset it must be through direct taxes or issuance of bonds, or else we must be content with holes in the road.

The board of directors of the Auto Club of Southern California, the board consisting of Fred L. Baker, W. L. Valentine, Horace G. Miller, A. V. Balch, H. W. Keller, Frank P. Flint, Edward T. Off, Harry Chandler and Edward D. Lyman, passed a series of resolutions from which we quote:

"Whereas, many complaints concerning the condition of the state highways were received at the office of the club, the board of directors caused to be prepared an engineering investigation and report on the highways of California with a view to ascertaining their true condition and of assisting in the preservation and further building thereof, which report was published and transmitted on March 17, 1921, to His Excellency, the governor of this state, to the state highway commission, to the members of the legislature and to the boards of supervisors of the counties of Southern California, and

"Whereas, this report has been amply corroborated by the recent report of the federal bureau of public roads, and

"Whereas, the report prepared by the engineers of this club, assisted by the county highway engineers of most of the Southern California counties, shows that our state highways are inadequate to meet the needs of the traffic over them, because built upon insufficient foundations, without proper preparation of sub-grade or study of sub-soil and drainage conditions; because too narrow, too thin and made of too poor a mixture of concrete—being narrower, thinner and poorer in quality than similar highways now being built by other states, 30 per cent of said highways being already in need of reconstruction, and the average life of said highways being but 15 years, while the final maturities of the three state highway bond issues are 1961, 1962 and 1965, respectively.

"Now, therefore, be it resolved, that the Automobile Club of Southern California hereby declares it to be the policy of the club to insist upon the completion at as early a date as possible of all the highways promised by the state of California; the building of such highways of material, foundation, quality, width and surface as will provide the people of California with highways that will be superior to, or at least the equal of, those constructed by any other state in the Union, such highways being essential to our traffic development, which will undoubtedly keep pace with the inevitable development of California; the preservation of such highways and bridges by the adequate regulation of traffic thereover, including the limitation of loads, and the careful, tireless and efficient maintenance of all highways heretofore or hereafter constructed."

As to the second of the paragraphs quoted we give the following from the report of the bureau of public roads of the U. S. department of agriculture. In its study of the California highway system the bureau made 7,500 photographs, "638 cores were drilled in the pavement at intervals on 800 miles of the highway between Red Bluff and San Diego. Soil mixture and sub-grade conditions were studied; state wide traffic census was taken at 103 substations; intensive special studies were made." The whole makes a printed report of some 500 pages, from which we take:

"The work of the state highway commission and of the highway engineer shows a continuous and intelligent devotion to public duty. Their construction operations have been widely extended under greatly varying conditions. A high degree of standardization was doubtless necessary and is evident. The failure (12.5 per cent) of D, E and F pavements are not extensive and some were unavoidable on large scale work. * * * The operations have produced large mileage of very serviceable roads and from an economic standpoint are conspicuously successful and of continuing benefit to the state. * * * The financial administration has been scrupulously honest and careful, and the administrative and engineering costs have not been excessive, nor have final costs much exceeded the engineer's estimates. There should be no hesitation in going forward with confidence."

Regarding 30 per cent of reconstruction necessary Chas. A. Whitmore answers:

"Whatever reconstruction is now necessary, except over adverse subgrade, has been occasioned by unprecedented increase in automobile traffic, and by gross overloading of trucks, and not by any essential fault in the structure of the pavement to meet traffic needs for which it was designed.

"When the construction of the state system commenced, the registration of motor vehicles was about 35,000, with trucks a negligible quantity. The increase of traffic was gradual for several years, but the war brought phenomenal development of truck use, there being now as many trucks registered in the state as there were automobiles and trucks combined in 1910. The total registration of motor vehicles of all kinds this year approaches 600,000 as against 35,000 ten years ago. It is manifestly unfair to criticize the construction of yesterday in the light of today's traffic. Furthermore the California highway commission was obliged by the highway needs of the state to provide an adequate mileage of serviceable highways. The people were led to expect and demand this mileage by the character of the system nominated in the original and succeeding highway acts. To have placed another interpretation upon the mandate of the people and to have constructed a comparatively small mileage of thick, wide concrete highways between population centers would have been to jeopardize the completion of the system and would have retarded construction of county systems to connect with the state system. A large mileage of serviceable highways is the measure of highway accomplishment in California and is appreciated by the U. S. bureau of public roads, if not by the automobile clubs of the state. In submitting its report, Thomas H. McDonald, chief of the bureau of public roads, says, in part:

" 'Within the past five years an unprecedented demand has been made upon the highway administrator and highway engineer to produce a large mileage of economical and serviceable highways. The extent to which he has produced this combined result is the true standard of measurement of his achievement.

" 'Let the present traffic service rendered by the state highways of California, conservatively estimated, we believe, at 400,000,000 vehicle miles per year, be multiplied by any reasonable unit rate to indicate the present annual returns to the people on the total investment to date of about $42,000,000.'

"Correctly interpreting the needs of the state in mileage of paved roads, the California highway commission designed a concrete base of minimum width and thickness, capable of being widened and thickened as traffic needs developed. Through this policy the state for nine years has had the use of over twice the mileage of concrete road that it would otherwise have had. These roads reach every important center of population. They are earning, according to the federal bureau of economists, 50 per cent per year on our total highway investment, or $20,000,000 per year on an investment June 20, 1920, of $42,000,000. They may be widened and thickened without any appreciable loss of ultimate road service and at a total cost for original investment, maintenance and reconstruction but little in excess of the present day cost of the construction of a wider, thicker highway.

"The commission's plans for bringing the trunk lines of the state abreast of the traffic needs of today include the construction of concrete shoulders 2½ feet wide and six to eight inches thick with the center section over the old concrete base covered with two inches of Topeka or four inches of reenforced concrete wearing surface. If the demand for this treatment is in advance of the ability of the California highway commission to meet it, the fault lies solely with the two automobile clubs of the state which maintained a lobby throughout the entire session of the late legislature opposing every effort of the California highway commission, through a gasoline tax and a moderate increase of motor vehicle license fees, principally on heavy duty trucks, to get the funds essential for this construction. This failure to increase motor license fees leaves California with a situation where a two ton White pneumatic tired truck pays the same license fee,

(Continued on Page 143.)

Agricultural News Notes of the Pacific Coast

Northern California

Alameda County farm bureau has membership of 611.

Placer County farmers are paying 35 cents an hour for unskilled labor.

Alameda County farm agent reports 20,000 fowls tested for egg laying capacity.

Nevada County voted on the formation of an irrigation district on August 4.

J. F. Campbell of Colusa has been appointed to the state reclamation board to succeed Frank Freeman of Willows.

Stockton has established a municipal camp at the old Gray Eagle mine in Placer County.

Because of loss of funds the Sonoma County farm bureau will lose the services of assistant farm adviser.

Machinery has been shipped for cooling and cold storage plant at the Durham land colony in Butte County.

The poultry department of the Alameda County farm bureau held picnic at Hayward Memorial Park, August 2.

Lower freight rates on canned goods and farm products are announced by the railroad, effective July 21 and August 22.

Sonoma County's appropriation for farm bureau work has been cut $2,500, making it necessary for one member of the staff to leave the work.

The Butte County supervisors have appropriated $2,000 for agricultural extension work, dispensing with the office of county agent's assistant.

Oroville's Orange and Olive Fair will be held in November. The chamber of commerce is urging exhibitors to be prepared with their best.

A new sawmill and box factory is being erected at Oroville by the Hutchinson Company. It will have daily cutting capacity of 400,000 board feet.

Colusa County fair at Arbuckle, September 29-October 1. Effort is to be made to have schools of the county close on September 30, which will be children's day at the fair.

George Stam of Kirksville, Colusa County, is shipping a barge load of barley, which will go direct by water from his ranch in Sutter Basin to Holland for malt manufacture.

Miss Lillian Clark, home demonstration agent of the university extension service, will visit Eldorado County, August 3 to 6, for the purpose of demonstrating home methods of fruit evaporation. She will visit Georgetown, Coloma, Camino, Eldorado, Rescue, Cool and Placerville.

The Humboldt County Cattlemen's Association has decided to purchase a number of pure bred bulls to head range herds in the county. Horned and polled Herefords and Durhams are the breeds selected. Stock purchased will be exhibited at the county fair at Ferndale in September.

The Garberville farm center of Humboldt County is outlining plans for the construction of a milk skimming station and is also signing up farmers to plant an acreage of blackberries sufficiently large to warrant the construction of a dehydrating plant to evaporate this product before it is placed on the market.

Central California

Turlock is now sending out more than 50 carloads of melons a day.

Madera County has added 8,356 acres to her vineyards during the past year.

Tentative dates for San Benito County farm bureau fair are September 22-24.

The second carload of figs sent from Dinuba to Chicago brought $1.58 per box.

A carload of Tokay grapes was shipped last week from West Colony near Manteca.

Sanger, Fresno County, irrigation district organization election will be held September 15.

The farm bureau hog auction at Turlock, July 19, brought top price of $11.25 per hundred.

Most of the farm centers of Stanislaus County have discontinued meetings until September.

The Carmel Pear Growers Association, Monterey County, has let contract for construction of a new warehouse.

The Hume cannery at Turlock is now running on peaches and will continue till the last of September. Fruit is of good size and quality.

Orange Cove house of the Grape Growers Association opened with a table grape pack last week, ten days or more ahead of the usual schedule.

In answer to question of the state railroad commission as to present status of Tulare Lake, County Supervisor May of Kings writes: "Plumb dry."

"Almost all farmers in Madera County have given their hearty cooperation in rodent control work in Madera," says Commissioner George Marchbank.

The U. S. bureau of markets is giving daily market reports to Turlock producers. Arrangements for this service were made by the local chamber of commerce.

D. H. Bitner, manager of hog auction sales of the farm bureau marketing association, is in Stanislaus County working with W. J. Norton in card indexing all hog raisers.

Farmers in the Riverside-Laton section of Fresno County are busy circulating petitions asking the board of supervisors to complete the Fowler-Hanford trunk line highway before any side lines are improved.

The Pratt-Low preserving plant at Modesto started on peaches July 19. Five hundred employees are busy handling the fruit. The Cooperative Cannery started on peaches on t same day. It has been running for several weeks on apricots.

Tester Wolf for the dairy department of the San Joaquin County farm bureau reports 486 cows tested during June, 57 making 40 pounds butterfat or better. A Holstein owned by Fottrell Bros. of Stockton held the record with production of 80.9 pounds fat.

About 100 dairymen from the district south of Bakersfield attended a meeting in the Panama school house to organize a dairy department with a cow testing association of the Kern County farm bureau. Owners of several hundred cows pledged membership.

Southern California

Imperial Valley is shipping out grapes, several carloads a day.

Placentia, Orange County, reports half the Valencia crop shipped.

The Oxnard sugar factory has opened for a run of 100 days or more.

The Beaumont Fruit Growers Association has sold 30 tons of cherries this year.

The Poultry Producers of Southern California is now receiving eggs from 650 shippers.

The Los Angeles County Poultry Club held a picnic at Manhattan Beach, July 28.

The sugar factory at Los Alamitos is busy slicing beets, employing 400 men in 12 hour shifts.

The hot weather of last week was not appreciated by the Lima beans say Camarillo growers.

The farm bureau egg laying contest opens at Pomona October 1. Cost of entry is $2 per bird, $24 per pen.

The supervisors of San Bernardino County have enacted measure to prevent sale of meat from tubercular cows.

A series of field meetings on the nematode is being held in Los Angeles County under auspices of the farm bureau.

The cannery of the California Growers Association at Santa Ana has started on the peach pack. Three hundred men, all whites, are employed.

Supervisors of San Bernardino, Riverside and Orange Counties are considering enactment of same requirements as to motor truck weights.

President Teague and Manager Thorpe of the California Walnut Growers have left for Washington to renew fight for four cent duty on foreign walnuts.

The Orange County farm labor association has employed a director to have charge of an office at Santa Ana. There will be no charge to laborers for placing them.

Los Angeles County farm bureau meetings were held at Downey and Glendora, August 1; Alhambra, 2; Zelzah, 3; Lankershim, 4; Whittier and San Fernando, 5.

New freight tariffs scheduled by the Santa Fe reduce the carload rate on fat sheep from Blythe and Ripley to Los Angeles from $102.50 to $81. On beef cattle the tariff is lowered from $136.70 to $113.

Another payment of a half cent a pound on last year's crop of Limas is to be made within a few days. This will make a total of five cents on recleaned basis. And there will be more to follow, Manager Churchill says.

An egg laying contest is to be inaugurated at Pomona, October 1. The poultry departments of Los Angeles, San Bernardino, Riverside and San Diego are cooperating with the Poultry Producers of Southern California in the contest.

Manager Powell and Assistant Manager Dezell of the California Fruit Growers Exchange are in Washington to appear before the ways and means committee to convince them of the reasonableness of California's demands for sufficient protection for lemons and citrus fruit products.

The Coast and General

Walnut growers of western Oregon expect a record crop.

Recent farm bureau picnic at Roseburg, Oregon, brought together 2,000 farmers.

Oregon loganberry growers say that prices offered by canners are less than cost of picking.

Wasco County, Oregon, grain farmers report 15 to 25 per cent of last year's crops still unsold.

The Australian government has levied a duty of one pence a pound on bananas imported from the Fiji Islands.

Stock judging by calf club members was the feature of the meeting of the Columbia County, Oregon, Jersey Cattle Club at Scappoose last week.

Spokane County beekeepers recently formed an organization to affiliate with the state association. The first regular meeting was held June 24 at Spokane.

The Pomological Committee of Australia held its annual conference recently at Melbourne. Vice-President Warren of the American Pomological Society was in attendance.

The London Times says: "It is officially estimated that within five years Victoria (Australia) alone will have 50,000 tons of tinned fruit for which she will require a market abroad."

Potato growers of Washington, Oregon, Idaho and western Montana are considering formation of a Northwest Potato Growers Association, and the holding of a fall show and conference, presumably at Spokane.

California has 1.1 per cent of all land in the state included in drainage districts; Indiana has 40.7; Ohio, 31.2; Washington, .2; Colorado, .3. Arizona, Nevada, New Mexico, Oklahoma and Oregon show no land in drainage districts.

At a recent meeting of the Oregon Cooperative Grain Growers Association, A. H. Lea, for several years secretary of the Oregon state fair, now general manager of the Western Wool Growers Warehouse Association, was elected general manager for the wheat growers. Headquarters will be at Portland.

Los Angeles and the board of public service commissioners of that city have filed an application with W. S. Norvell, state water commissioner of Arizona, for right to build a dam to store water on the Colorado River for power and irrigation purposes. This is said to be in accordance with general plans of the United States reclamation service.

Rains during the past few days have materially improved range conditions in some parts of Arizona. About one inch of rain fell at Tucson, nearly two inches at Nogales. Other points in the south part of the state where conditions were at their worst also report rainfall. Williams in the north part had a nice rain of more than an inch. If rains continue during the next few weeks, which will cover the usual rainy period, cattle losses will be stopped and range conditions will probably improve to an extent which will enable the cattle growers to carry over till fall.

Time Tables for Fruit and Vegetable Canning

By W. V. Cruess

DURING the rush of the canning season it is often troublesome and wasteful of time to have to read through several pages of printed matter to ascertain the proper length of time for the treatment and sterilization of home canned products. The writer has therefore thought it desirable to assemble in table form the most important data bearing upon the sterilization of vegetables and meats.

Precautions and Suggestions

Altitude: The tables are designed for altitudes from sea level to 1,000 feet altitude. For altitudes above 1,000 feet increase the time of sterilization at 212 degrees Fahrenheit ten per cent for each 500 feet increase in altitude. Example: If time of sterilization at sea level is 90 minutes, it would at 3,000 feet altitude be 40 per cent more than 90 minutes, or 90 plus (40%x90) equals 90 plus 36 equals 126 minutes. At 3,000 feet, 40 per cent more time is required because this altitude is 2,000 feet above the 1,000 foot level and 10 per cent is added for each 500 feet above the 1,000 foot level. Pressure sterilizers only should be used for high altitudes for vegetables and meats.

Size of Containers: The table is based upon the quart jar as the container. Smaller jars require slightly less time and larger jars slightly more. Gallon cans require the same time as quart jars; quart and smaller cans, about 10 per cent less time than quart jars.

How to Count Time of Sterilization: Do not count time of sterilization until the water reaches the boiling point, if a hot water sterilizer is used or until the desired pressure is reached in a pressure sterilizer. All other time is not counted. This point is of utmost importance.

Brines: Two kinds of brine are in common use, namely, plain brine and acidified brine. When the pressure cooker is to be employed the plain brine is recommended. Where the washboiler sterilizer is used, acidified brines are advised.

When using acidified brines 5 fluid ounces of lemon juice or strong white distilled vinegar and 2 level tablespoonfuls of salt are added to one gallon of water. Five fluid ounces is about 2/3 of an 8-ounce measuring cup. This brine is added to the jars when canning vegetables by the lemon juice method. Where other methods are used, omit the lemon juice or vinegar. A longer time of sterilization is needed when the vinegar or lemon juice is omitted.

Cooking Before Serving: All home canned vegetables and meats should be heated to boiling and boiled ten minutes after the jar is opened for use. This removes all danger of botulinus ("ptomaine") poisoning. Never serve salad from freshly opened home canned foods unless boiled after opening. Discard all home canned food of "off" odor.

Home Made Sterilizer: For sterilizing at 212 degrees Fahrenheit a sterilizer can be easily made by placing a frame made of several slats in the bottom of a washboiler. The jars are placed on this false bottom and water is added to half the height of the jars in the University method or to cover the jars in U. S. D. A. method. The cover is placed on the boiler and the water is heated to boiling. Count time of sterilization from the time the water boils.

Pressure Cooker: Use these if possible for vegetables and meats in preference to an open boiler and use 10 to 15 pounds pressure rather than lower pressures. Cans "behave" much better than jars in a pressure cooker. Breakage losses with glass in pressure cookers are excessive. Use glass jars in open cookers and tin in pressure sterilizers. It is usually necessary to permit the pressure of the retort to fall to 0 before release valve is opened if glass jars are used; or to release the pressure very slowly allowing at least 10 minutes for the pressure to fall to 0, in order to avoid excessive loss of brine or syrup from the jars. The release valve may be opened as soon as sterilization is complete if tin cans are used.

Can Sealers: The Burpee and other home can sealers are satisfactory and much superior to soldering outfits. Buy the small handpower reflanging type sealer adapted to No. 2 and No. 2½ cans. Buy Sanitary cans; that is, the open top commercial Sanitary cannery type of can which requires no solder. The cans may be used several seasons. This reduces first cost of cans.

Blanching (parboiling): Most vegetables require blanching in boiling water before canning. This process removes disagreeable flavors, causes the brine to be clearer, sets the green color of the vegetables and softens them so that more product may be placed in the jar. The table gives the time of blanching for each product.

Meats: Meat is more readily sterilized if it is not packed too tightly in the jars and if boiling hot brine or broth is added to fill the spaces. Some meats may be canned in acidified brines as directed for vegetables. All meats should be cooked after jar is opened and before tasting or serving. Broth is easily made by boiling some of the meat or bones in salted water. Corned beef should be canned in liquid containing pure gelatin.

TIME FOR STERILIZING VEGETABLES IN JARS (In Minutes)

	Parboiling or Blanching	One period lemon juice, 212 degrees F.	*One period 212 degrees F.	Water seal 214 degrees F.	Steam pressure 5-10 lbs.	Steam pressure 10-15 lbs.
String beans	5-10	90	120	90	60	40
Peas	5-10	90	180	120	60	40
Tomatoes (Peeling)	1½	....	60	30	20	15
Corn (Sweet), (before cutting)	5	120	180	120	20	60
Lima beans, gr.	5-10	120	180	120	60	40
Pumpkin-Squash	3	90	120	90	60	40
Peppers	5-10	60	120	90	60	40
Cabbage-Sprouts	5-10	90	120	90	60	40
Cauliflower	3	45	60	40	30	20
Carrots, Parsnips	5	60	90	80	60	40
Turnips	5	60	90	80	60	40
Beets (peeling)	10	60	90	80	60	40
Salsify	5	60	90	80	60	40
S. Potatoes	10	....	90	80	60	40
Greens	15	90	180	90	60	40
Asparagus	5	90	180	90	60	40
Artichokes	10	60	120	90	60	40

In the three day method sterilize one hour on each of the three successive days at 212 degrees Fahrenheit, counting time from the time the water reaches the boiling point.

*The one period is the least certain method and least to be recommended.

TIME FOR STERILIZING MEATS (In Minutes)

	Hot Water Sterilizer	Water Seal 214 deg. F.	Steam Pressure 5-10 lbs.	Steam Pressure 10-15 lbs.
Uncooked beef, pork, and mutton in broth	240	180	120	60

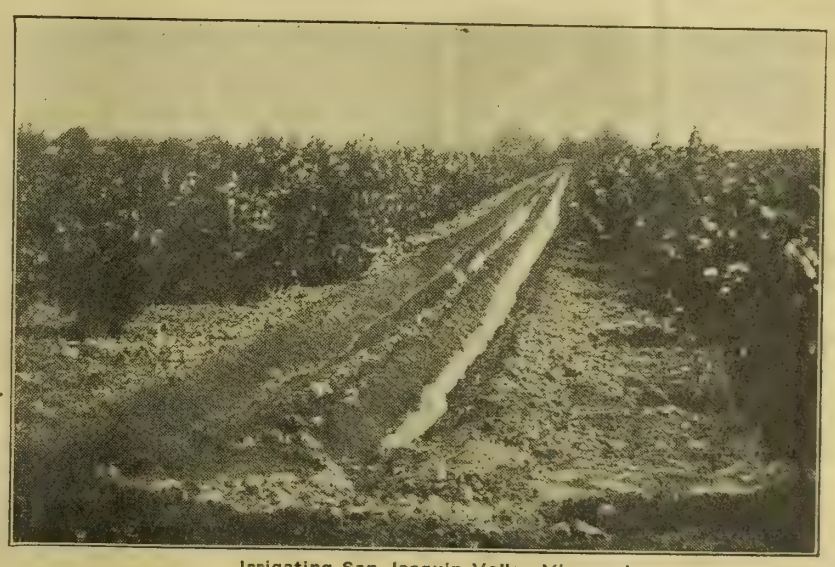
Making Quality Raisins

By Fred K. Howard

WHAT is necessary to make a quality raisin? This question is uppermost in the minds of all who are interested in the future welfare of the California raisin industry. Incidentally, this same question is on the minds of all who have given any thought to production, whether they are interested in the manufactures or in the products of the soil. The question is of prime importance because of the realization that future prosperity depends on whether or not consumers are offered a superior product. With raisins, as with other fruit foods, it matters little how attractive the package, how sanitary the packing houses, how large the advertising appropriation, if quality is not in the product itself continued successful marketing is impossible.

Everyone admits that quality is necessary, yet it is astonishing how many wish that the other fellow would produce the good fruit and in sufficient quantities to carry their own poorer grades—a selfish yet extremely human trait.



Irrigating San Joaquin Valley Vineyard

Water in sufficient quantities, applied when and where it is needed, and not after it is needed is of great importance.

There are two things which the raisin grower must consider when undertaking to produce the kind of fruit the consumer is most interested in, quality fruit. The first is that the grapes must be well grown; the second that the fruit must be well cured. We are going to touch on the vital points incident to the growing of the fruit in this issue of the Cultivator, leaving the other factor to be considered in a future issue.

The grapevine has certain functions to perform. The one we most frequently think of is the production of fruit, and very often we think of that function to the exclusion of its other duties. It is true that if a vine does not produce fruit it is worthless in

(Continued on Page 131.)

You Wouldn't Buy a Pony for Draft-Horse Work

IF you were buying horses for draft work, you would have no use for light-weight, under-sized teams. You would want strong and rugged horses, deep-chested, strong-limbed, with plenty of weight to throw into the collar and stay with the load. You would never buy ponies for draft-horse work.

WATERLOO BOY KEROSENE TRACTOR

Remember that a tractor in its most important jobs has to do heavy-duty work continuously, often under difficult conditions. In plowing, in disking, at any drawbar job, the footing is uncertain, the going rough. But the load is always there, testing the tractor's stability every second. It is a load that a light-weight, low-powered outfit often cannot stand up under. It is a load that takes rugged construction and plenty of "brute power."

Use the same good judgment in buying your tractor that you did in buying your horses—get a Waterloo Boy. It has the power, the rugged construction, and the stamina to handle the load, day after day, week after week, year after year.

Inspect the Waterloo Boy at your John Deere dealer's. Have him demonstrate it for you on your own farm. Drive it yourself. It will do your work as you want it done.

A post card will bring you our big free booklet fully illustrating and describing the Waterloo Boy. Write to John Deere, Moline, Ill., and ask for booklet T 9 6.

First Avocado Field Day

By Ernest Braunton

SO many seedling avocado trees abound in California dooryards and so many poor varieties need budding or grafting to better ones that the California Avocado Association decided to hold a field meet to demonstrate the best methods of top-working. This picnic and field meet was held Saturday, July 30, beginning with a basket lunch and program at the Puente Valley Walnut Growers warehouse at Puente, said to be the largest in the world.

The forenoon was spent in friendly intercourse, just a "visitin' day." Everyone brought his lunch and free coffee and avocado ice cream were served at noon. Frank M. Colville, president of the Puente chamber of commerce and editor of the Puente Valley Journal, was master of ceremonies and delivered the address of welcome. He said the walnut packing-house in which we were gathered is the largest in the world, "having a daily capacity of a million pounds of nuts, and I am glad to see so many here today." This sally of wit evoked so much applause that he announced there were about 900 persons present, but a close count by the writer caught but 720 of them. Perhaps the remainder of the "nuts" had fled.

Demonstrating Grafting of Avocado

Before the crowd arrived in the orchard. Platform and one of avocado trees arranged for grafting demonstration on E. G. Hart Ranch at North Whittier heights.

Dr. W. L. Hardin, president of the avocado association, responded to the welcome, enumerating the many activities of the Puente people to make the meeting a success and a pleasure, for which he extended the sincere thanks of the avocado association, also speaking on behalf of those present. He then introduced Roy V. Wilcox, president of the California Association of Nurserymen, who told of the mammoth flower, fruit and plant exhibition to be held at Exposition Park, Los Angeles, October 20-23. J. A. Packard of the Southern California Fair to be held at Riverside, October 11-16, also invited those present to visit the fair. At both events there will be an avocado display, and it is expected the avocado convention will merge with that of the nurserymen.

The visitors then motored to the avocado orchards of the Edwin G. Hart Company, between Puente and Whittier, where the topworking demonstrations were given. Before departure the writer counted 234 automobiles ranged about the Puente warehouse, a testimonial to the affluence of the avocado "fans."

At the orchard forum a platform had been erected about a large tree, high enough so all could see in detail the workings of the grafters. The top of the tree had been sawed off and all made ready for immediate demonstration, under the direction of T. U. Barbour of the Hart Company. Dr. W. R. Manning of Fillmore was the first speaker and workman and showed, with full explanations, every detail of the cleft grafting so successfully practiced by him in his home orchard. This is practically the same method used in all cleft grafting of deciduous trees. S. W. Funk of Covina then showed how he performed bark or side grafting, a method equally as successful as the cleft grafting and more in favor among avocado experts. Both speakers distributed prepared grafts to those below so that all could see how easily and simply the work could be performed.

This was doubtless the greatest "avocado day" the world has ever seen and will be made an annual event.

THE FARM BUREAU BLOC

NO movement of producers of the land has ever secured such impetus, or power to do things, as has the farm bureau. It has taken up methods of work found successful by existing cooperative organizations and applied them with telling force. The greatest of national movements put through by the farm bureau is that of grain marketing which it now appears will be a complete success.

Its power in a legislative way has also made itself felt and it is now in a position to accomplish still more for producing interests. From the Berkeley office of the state farm bureau federation we have the following statement as to its future influence along legislative lines:

"The farm bureau has created a national legislative situation which has been given the uncommon term or name of 'bloc'. The American Farm Bureau Federation, through its Washington office, has, in cooperation with numerous agricultural units, developed a comprehensive agricultural legislation program in congress.

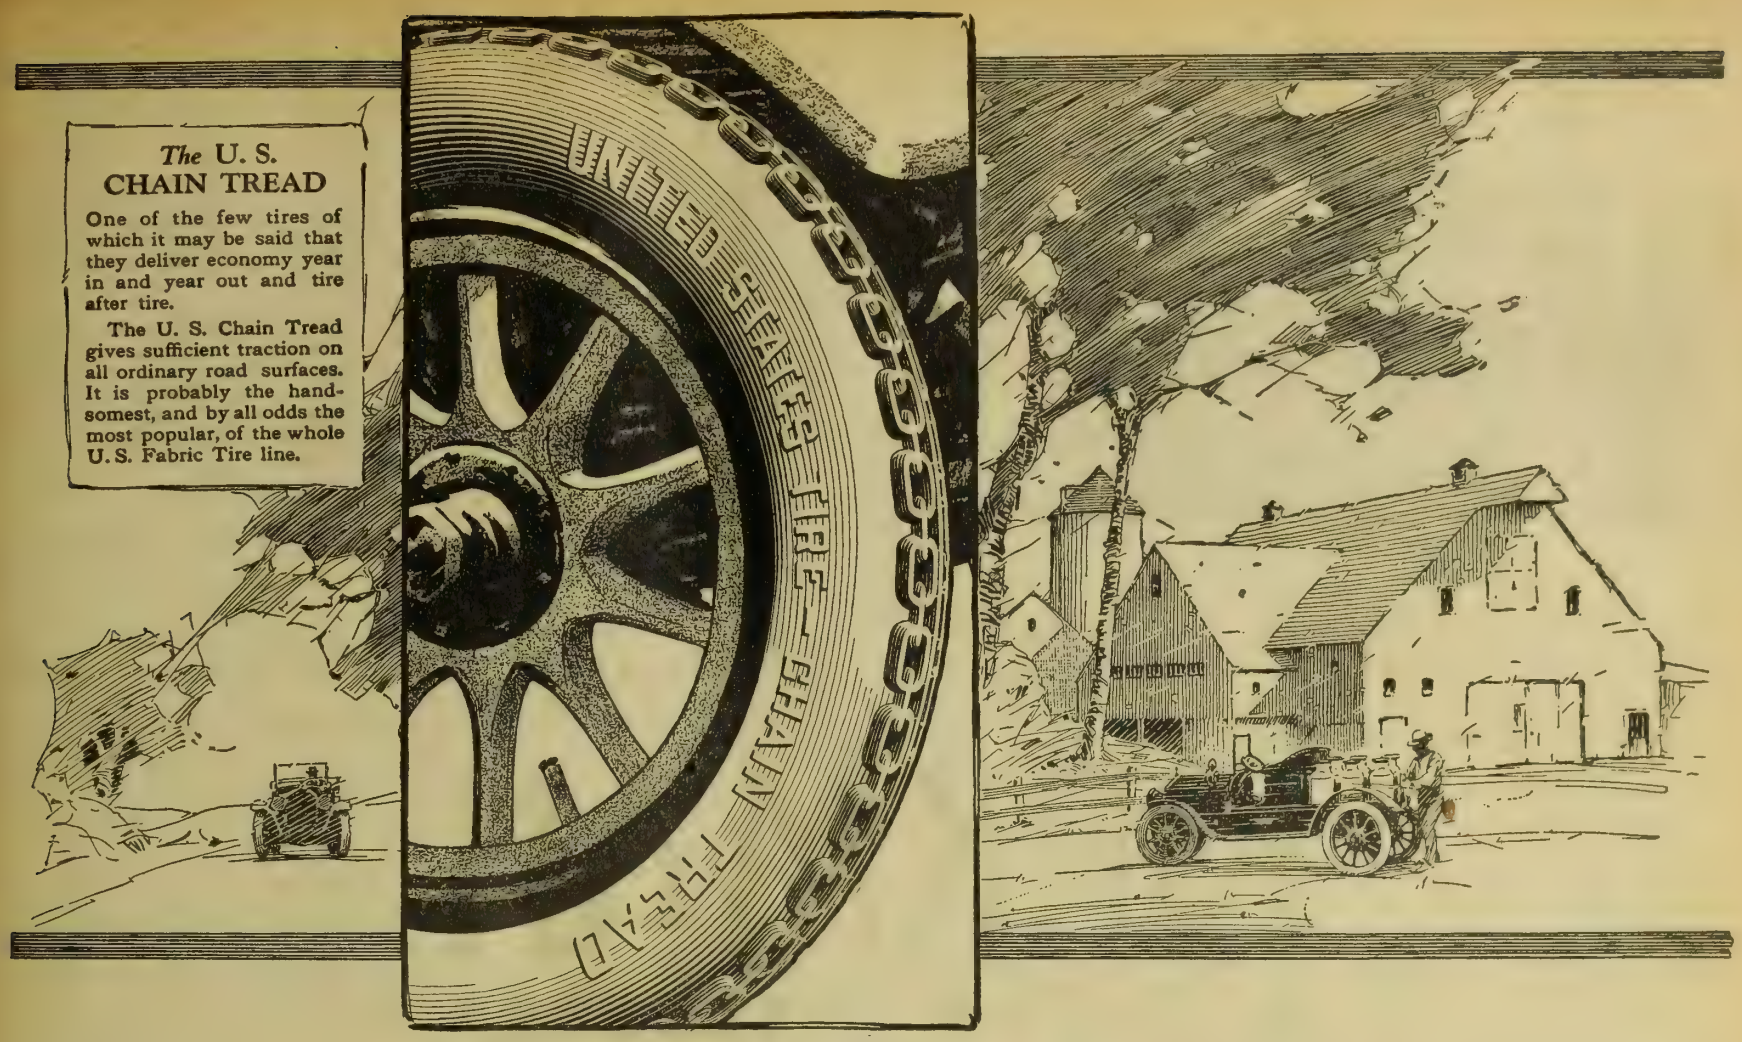
"In the senate there has been grouped an organized number of senators coming from agricultural states, with the purpose of building and controlling legislation affecting farmers. This group, or bloc, is not Republican nor Democratic in complexion and does not perform on party lines. It does not obey the caucuses of the two big parties when the issues are not in agreement with the bloc. The bloc in the senate holds caucuses of its own It controls a large influence and has the support of certain senators upon occasion who are not members of the bloc. This group represents the first great organized movement in congress for putting through definite legislation. Senator Kenyon of Iowa is chairman of the bloc in the senate.

"The house maintains a similar bloc with a membership of over 100 representatives. In both houses the bloc controls many more votes than the membership indicates.

"The bloc is alive and speaks plainly. It exists to get for the farmer such national help as he needs. Southern and western agricultural areas are mostly in the bloc. This group is working for a farm credit system, agricultural cooperative marketing statutes, a satisfactory agricultural tariff, packer control, truth in wool fabrics, agricultural roads, against grain gambling, and in fact the entire agricultural program of the farm bureau.

"Mr. Gilbert, of the Philadelphia Evening Public Ledger, says: 'These plans are ambitious. They rest on the farm bureau movement, which, with the federal and state aid at one end, have gathered the farmers into the most powerful and effective industrial organization ever brought together. The agrarian bloc in congress will become, if it is not already, the political representative of the farm bureau.

" 'The senate organization of agrarians is of profound significance. It cuts across party lines. Here is the biggest and most powerful group represented in congress by men owing in certain respects an allegiance to it admittedly superior to their allegiance to their party.' "



The U. S.
CHAIN TREAD
One of the few tires of which it may be said that they deliver economy year in and year out and tire after tire.
The U. S. Chain Tread gives sufficient traction on all ordinary road surfaces. It is probably the handsomest, and by all odds the most popular, of the whole U. S. Fabric Tire line.
UNITED STATES TIRE
CHAIN TREAD

Whose business is it to see that you get service and economy out of your tire money? How do you as a car-owner judge tire values?

Car-owners often come to U. S. Tires after they have paid too much for experience elsewhere. After a few seasons of dickering in "bargains" and "discounts" they at last find satisfaction and economy in the *quality first* of U. S. Tires.

You'll always find a U. S. Dealer selling a U. S. Tire with every confidence in his product. Full conscious of the value you are getting and *deserve*. Knowing that U. S. Tire makers stand behind every U. S. Tire with an iron-clad policy of honest manufacture and selling methods.

The August Vegetable Garden in Southern Arizona

By M. E. Bemis

BEANS of several varieties may be planted in August. Probably there is no variety that does so well in Arizona as the Pink, or Mexican frijole. This variety for the main crop should be planted early in the month. A sandy loam is best and if there is more sand than loam so much the more desirable, in other words, a soil that will not bake and form clods is preferable.

The land should be well prepared and the rows 20 to 24 inches apart. The ground should be well saturated with water before planting. Many bean growers prefer to plant level. With a well saturated soil the seed should germinate without further irrigation. As soon as the plants show, furrows should be run between the rows and water run in the furrows. If the seed does not germinate the furrow should be run anyway and the land irrigated, taking care not to flood. Beans require considerable water.

Pink beans will mature in about 90 days from planting, and as frosts may be expected about November 10 to 15 in the Salt River Valley, a little earlier in the vicinity of Tucson, and a little later in the Yuma Valley, it is obvious that the planting should be not later than the 10th of August. Pink beans are also used quite extensively for green or string beans and are very satisfactory for this purpose.

Other varieties of beans may be planted in August, and as some of these mature more quickly these early varieties may be planted later. Usually beans will not set well in hot weather, so it is advisable to plant as late as possible and have time to mature a crop.

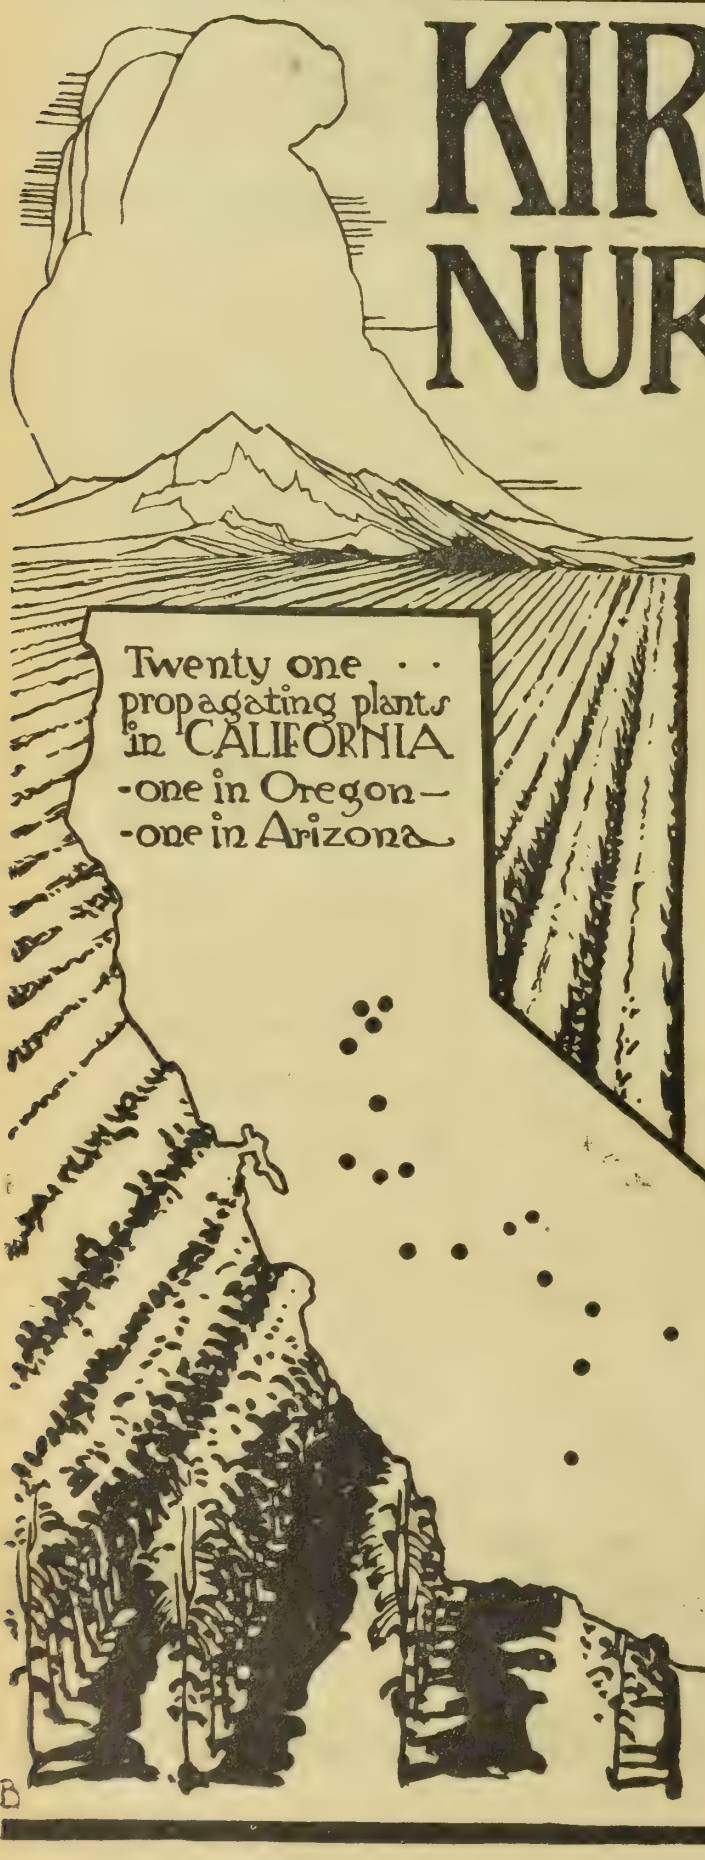
Usually it is not advisable to plant lettuce as early as the latter part of August; commercial plantings are usually made the latter part of September or early October. There is an advantage in planting early as the earlier planted the earlier will it mature, but usually it is too warm to permit of germination. Occasionally there are a few days and particularly cool nights the latter part of August when seeds of lettuce, beets, spinach and seeds of that kind may be planted with a very fair chance of germination. The gardener that has his ground ready to take advantage of these cool periods is able to mature his plants much ahead of the general crop. Sometimes germination is encouraged by mulching with well rotted manure, sometimes by shading. A little pains and planning enables one to beat his neighbors in early fall garden stuff or if he is selling for the market to get in on the early market when prices are top notch.

Early August is still time for planting Mexican June corn for roasting ears. The Indian sweet corn sometimes called "Papago" is coming more and more into well deserved favor. As this makes roasting ears in about ten weeks from planting there is time all through the month to plant a succession. The ears of this corn are small but as the cob is also small there is really much more grain than seems from a casual glance at the ear, and the small plant, prolificacy and, last and best of all, the quality makes this especially desirable for the home gardener.

Early peas may be planted the latter part of the month. These should mature before extreme cold weather. The late maturing varieties are best planted later in the season for maturing in early spring.

Cabbage seed may be started in shaded beds for plants to be set out later. Cabbage is grown commercially by some of the Japanese and Chinese gardeners, and no doubt could be grown for shipping were it not for the excessive transportation costs. Cauliflower also should be planted this month for early plants for later transplanting.

September begins a month of more activity for the fall garden, and to that end August is a month of preparation, manuring if it has not already been done and plowing to make ready for heavier planting when cooler days make germination less of a gamble.



KIRKMAN NURSERIES

Reliable Trees and Vines

For Commercial Orchard and Vineyard Planting

Deliveries made direct from nearest propagating plant. To serve the orchard and vineyard planters of California to the fullest satisfaction and efficiency is our aim. We are gratified to have entrusted to us the future of small orchards as well as the large projects. One acre of Kirkman Trees will draw to us greater future plantings. One California orchard has taken two hundred and fifty thousand of our trees. Another four hundred thousand trees. Another six hundred thousand trees and vines together. They have reservations with us for their next season's plantings. The Ex-Governor of Coahuila, Mexico, named his immense project "El Fresno" in honor of our deliveries of nursery stock. We plan to serve every customer so satisfactorily that his future profits will be assured. Correspondence solicited.

Kirkman Nurseries

Fresno, California

STIMULATE CALIFORNIA POTATO INDUSTRY

W. V. Shear, potato inspector of the California department of agriculture, in summing up the present outlook for California potatoes, says: "After standardizing and grading the next big problem confronting the potato growers of California is that of the adaptation of selected potato varieties. Local conditions vary so greatly with reference to both soil and climate even within short distances and a variety adapted for one locality is quite often not the best for use in another district near by. Also, in a given section a change of variety is often advisable for different seasons of the year. It is therefore necessary in order that growers should get the best possible results that they understand the adaptation of different varieties for certain climatic conditions.

"Two examples may be mentioned of varieties that have different characteristics which make them adapted for certain purposes. The White Rose has been found to be well adapted for the production of early potatoes over a large section of the state, but this is especially true for the warmer portions. This variety does well in warm weather and where a minimum amount of moisture is available. They have a tendency to set but few potatoes to the individual plant, but these few usually become of marketable size and therefore nearly always produce a fair yield if certified seed is used.

"The British Queen, on the other hand, has not been found to be adapted to very warm climates, but delights in cool weather, sets a large number of potatoes, and the plant requires a productive soil with plenty of water in order to produce marketable tubers.

"Many other varieties might be mentioned which differ with reference to adaptability to climate and soil, as well as cultural and irrigation requirements. Added to this complexity of the situation is the fact that a given variety of potatoes is often sold under several different names, some dealers selling them under one name and other dealers under other names. This causes great confusion and loss to our potato growers. The whole question of potato varieties needs a more thorough study than has yet been given it, and some legislation which will prevent deception in renaming potato varieties should be enacted. Our potato varieties need a fuller classification and should be sold under uniform names throughout the country. The writer is at present growing a collection of a great many varieties and strains for the study of the peculiarities of each in the hope that in California we may be able to group the varieties being used and in some measure at least save duplication of names for a single variety."

August in the Ornamental Garden in Southern California

By Ernest Braunton

DAHLIAS are now regarded as proper prey for a two season crop of flowers and the autumn crop is usually better than the earlier one. If the plants bloomed in spring the tops may now be cut down to the ground or to within six inches as you choose, and new tops made which will give a splendid crop of flowers in late October or November. But they must not be neglected. Water and fertilizer must be given in good supply and clean cultivation practiced.

An examination of Iris germanica beds will disclose rhizomes too thick for good flower crops and some on top of the soil. While this appears to be a natural disposition it does not produce the best results. Now is a good time to divide and plant them beneath the soil. In the heaviest soil this may be an inch or two and in light sandy loam three or four inches. Iris are so easily grown and such a superb range of good varieties may be obtained very cheaply that no garden should be confined to the very common whites and purples. California specialists catalog named varieties by the hundred.

Watsonia bulbs may be divided and replanted during August and September, with good results. Last year bulbs planted in the spring brought small spikes of poor flowers or none, though all bulbs were of good size and quality.

It is still early to plant other bulbs except freesias and August plantings will bring early flowers. Too many garden owners regard this as a season of rest, go away for a vacation and leave the plants to care for themselves. We have no "interregnum" in California; Queen Flora reigns continuously and all should meet their August responsibilities by keeping the garden in proper state. It is doubtful if neglect during any other month will so quickly produce a shabby garden, for weather is warm, soil is warm and dry and plant needs, in moisture at least, are great.

Chrysanthemums must be closely watched and kept well watered at all times and until color shows in the buds should be fed once each week with liquid or commercial fertilizers. At this late date do not use raw bone meal, no matter how finely ground. As plant food it will not be available in time to aid the coming flower crop, though acidulated bone flour will. The hardy perennials common to gardens of all countries should be sown this month and will bring blossoms next summer. You may also sow seeds of cineraria (for shaded flower beds), calendula, Canterbury bell, cosmos, dimorphotheca (South African orange daisy), lobelia, pansy, pink, primrose, petunia and verbena. Also all Australian and South African tree and shrub seeds and those native to California. Plants to set out now are: carnation, daisy, phlox, petunia, and violet.

One may gauge the constant need of soil moisture by the distress quickly shown by lawns even slightly neglected during the month of August.

Annual Report

The 20th annual report of the bureau of agriculture of the government of the Philippine Islands for the fiscal year ending December, 1920, is a graphic presentation of the agricultural wealth of those islands. A general statement of agricultural conditions at the beginning of the report notes that: "It is gratifying to state that never before in the history of Philippine agriculture has there been greater prosperity among the farmers, nor has there been a year in which greater progress has been made in agriculture, than that of the year 1920. The increase in area planted to crops, the corresponding increase in yield, and the stupendous increase in value received, make a new record in advancement for this important industry. There are many causes leading up to this remarkable development. The food campaign which has been carried on for some time is an important factor. This has been aided by the rice and corn fund, which has stimulated increased production of these important cereals. The introduction of modern tractors and gang plows has become quite general in the sugar producing provinces and will no doubt be extended to the rice fields more generally just as soon as irrigation projects are completed, thus making their use practicable. Seed selection has been another important factor in increasing yields. The upgrading of livestock by the importation of pure bred sires has had a share in improving conditions. The establishment and remarkable growth of rural credit among the small farmers has taught many of them the much needed habit of saving a part of their scanty funds and has furnished financial aid to many members who could not have obtained it otherwise. The establishment of poultry-swine stations, provincial and municipal nurseries, the increasing of the bureau's field force of farm advisers and agricultural inspectors, has brought a better knowledge of farming to those most interested. There have been no serious invasions of locusts, due to the activities of the work of the plant pests control division, which has likewise organized a plant quarantine service to prevent the introduction of plant pests through importation."

We note in the frontispiece a group of the staff composing the bureau of agriculture and in this photograph is the assistant director of agriculture, Silverio Apostol, who, many Californians will recall, visited this state a few years ago. When Mr. Apostol was in this country he was gathering information as to rice production and the use of power machinery and American made implements in rice production.

TWO QUEENS IN HIVE

The Agricultural Gazette of the Canadian ministry of agriculture says a government expert reports on two queen bees to a hive: "As it would be of great utility to find an efficacious method for preventing swarming without too much work, the author tried to solve the problem by keeping two queens in each hive for 11 months of the year. He found that this is a practical method and will try it again in 1919.

"Two young queens, separated by a double partition of wire gauze, were wintered in a hive in a cellar from 1917 to 1918. When the dandelion flowered the bees and queen from one side of the gauze were removed to another hive; in this way swarming was avoided and the two queens gave a uniform and increasing production of young bees, thanks to which two strong hives were obtained in time for the flowering of the clover. The number of bees was much greater than the number which began the season with one queen. These bees yielded 480 pounds of honey.

"In order to avoid swarming when the clover flowers, and to obtain two queens again in each hive (all the following operations were carried out in several colonies), the author removed the old queen from the brood chamber when the clover flowered and eight days later destroyed all the royal cells save two, one on each side of the metal gauze. A special porch fixed in front of the hive separated the entrances to each half by eight inches. This was done to avoid the possibility that the queens leaving their cells might meet on returning from their nuptial flight. These hives did not swarm."

Gill

One-piece Piston Rings

stop that smoky exhaust

because: no oil can work past them into the combustion chamber to be burned wastefully and harmfully. Black or gray blue smoke means that oil is finding its way into the firing chamber, and that one's pocketbook and motor are suffering. Gill Piston Rings stop that at once. And they keep it stopped through thousands of miles of service because they are individually cast from a special heat-resisting gray iron that retains its tension. They *stay* oil-proof.

Identify the Gill One-piece Piston Ring by the joint, but do not measure its merit by the joint *alone*.

Gill Service is nation wide. There are more than 2,500 stocks of Gill Piston Rings in the country. Some one of these dealers is located near you to supply you with whatever size you may want and the number you want *when* you want them. If your garage or repairman or accessory dealer doesn't happen to carry Gill One-piece Piston Rings tell him to get them from his jobber or from the nearest of our 39 Branch Offices.

Owners Who Spray Have Orchards That Pay

There's no doubt about it—now. Citricola and black scale in Southern California can be overcome—and red spiders routed—with Balfour, Guthrie & Company's patented formulas for spraying. Your trees—like those our experts sprayed on 20,000 acres in Tulare County—can produce fancy packs and bigger profits.

It is not too late to succeed with this year's crop. But you must start spraying **now.** You don't have to experiment. You can take advantage of the field tests that already have proved the superior merits of

B. T. S.	15 lbs.	Per	B. T. S.	10 to 12 lbs.
TRIUMPH	1½ to 2½ gals.	200 gal.	TRIUMPH	1 gal.
GLUE	1 lb.	Tank	GLUE	1 lb.
(for citricola and black scale)			(for red spiders)	

(patented formulas)

Scale infested trees. as you know, set much less fruit. By spraying NOW with our tested materials, you save your foliage and fruit from the honeydew and that black, sooty fungus later.

Write or call at our headquarters in the H. W. Hellman Building, Los Angeles. Frank B. Herbert, assistant entomologist and his aides will examine your grove free of charge. They will tell you the right spray to use and how to use it. To get best results, spray today.

A new bulletin on citrus spraying by our expert entomologist, Paul R. Jones, is yours for the asking.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Fire Damage in Reserve

To prevent spread of weeds I burned along my ditch line. A sudden wind caused the fire to escape into brush on the national forest reserve; I called the fire warden to assist in controlling it. Has the warden authority to assess fines to pay the expense of the fire fighters?—Subscriber, Valley Center.

Heavy penalties are provided for fires willfully or negligently caused in reserves, but if the fire was caused or escaped accidentally or unavoidably then the recovery shall be only for the actual damage sustained and the detriment to the land. The person causing any fire in violation of the act is liable for the full amount of the expense incurred in fighting the fire. The fire warden, of course, has no power to assess any penalty or award imprisonment as punishment for the misdemeanor which was committed in setting the fire without written permission. He would undoubtedly be vested with the right to compromise the civil liability, consisting of the damage caused to the forest reserve, whatever it might be, and the expense incurred in fighting the fire. It will undoubtedly be seen that under the provisions of the act his request for payment for the actual expenses of the fire fighters was exceedingly reasonable. The act as to its civil liabilities in a case such as yours, where the expense of the fire was caused by a mere accident, proceeds upon the general rule of the law that where one of two parties is injured, the party who first set the cause of injury in motion must be the one to pay. If you had set the fire under the supervision of the fire warden in the first instance, it would have been his duty to provide against any contingency of sudden wind.

Giving Up Contract

I bought land on an installment contract. I now find that it is not the right kind of land and I wish to let it go. I am required to pay the taxes. In case I fail to pay the taxes or the next installment on the contract, can I be required to pay anything else than money which I have already paid in, which I understand is forfeited on the default? Can I sell the contract?—Subscriber, Tulare.

The vendor in such a contract usually, depending, of course, upon the terms of the contract, has three different forms of action upon a failure to pay. He can merely bring action to quiet title to the land; he can bring action to rescind the contract for the default; or, he can affirm the contract of sale and bring suit against the vendee for the full purchase price. In such last event he could attach the land named in the contract, sell it under any execution obtained in the case, and make further levy upon any additional property of the vendee. You can undoubtedly sell the contract, subject to the terms of the payment. In any sale, however, it would be well for you to procure your release from the obligation which you assumed in the contract to pay the full purchase price, as in case your assignee failed to complete his payments the vendor could undoubtedly hold you therefor.

Minor Heirs

Can an estate in California be settled where the heirs are three adult children and two minor children of deceased child, residing in the East, without waiting until the minor children become of age? The mother of these minor children in their guardian.—Subscriber, Watsonville.

The estate may be settled in the usual manner and the proportion to which the minor children are entitled distributed to their guardian. The receipt of guardian will be a complete acquittance for the administrator of the estate.

Holographic Will

I have written the following will in my own handwriting, signed and dated it. Is it a valid will and how many witnesses are required?

"July 30, 1921. This is my last will and testament. I leave all of which I die possessed to my wife, Jane Doe, she to be executrix without bond. If she is not living at the time of my death, I leave all of my said property to my daughter, Mary Roe, said daughter to be executrix without bond. (Signed) John Doe."—Subscriber, Holtville.

Within the state of California, at least, the above will would be valid and would require no witnesses. It is known as an holographic will.

Boys Drive Illegally

My wife has an automobile which our boys drive. The law seems to make no restrictions on the age. In case of accident and damage suit, am I likely to be made a co-defendant? If so, how am I to protect myself?—Subscriber, San Jose.

You are in error in respect to there being no law placing a restriction upon the age of drivers. The motor vehicle act provides that each operator of a car shall be given a license or badge which he shall at all times while operating the car carry with him and upon his person and exhibit to any officer requiring to see the same. It further provides that no such license or badge shall be issued to any applicant under the age of 18 years and that it is unlawful for any person to cause or knowingly to permit his or her child or employe to operate or drive a motor vehicle upon a public highway whether as chauffeur or operator before having first obtained such license. No application to the department of a minor to operate or drive a motor vehicle shall be granted unless the parent or parents having custody of such applicant shall join in the application by signing the same. Any negligence of the minor so licensed in operating or driving such motor vehicle whether as chauffeur or operator shall be imputed to the person or persons who shall sign the application of such minor and they shall be held jointly and severally liable with such minor for any damages caused by such negligence. The operation of such car on a public highway without such license would undoubtedly render the minor liable for punishment for a misdemeanor, upon conviction of which he might be punished by fine nor exceeding $500, imprisonment in the county jail not exceeding six months, or both. The courts have also held where an automobile is purchased for pleasure, comfort and enjoyment of the family and the minor son is authorized and permitted to drive the autmobile, in such driving and using the car it is for the very purposes for which it was procured. In that sense he is in the business of his father as his agent and the father would be held liable. Under the familiar rule of the responsibility of a principal for the act of his agent in the course of his employment, the father has been held liable for any such damage. It is true that in several states the courts do not uphold this rule, but it has been upheld in California.

HOME CANNING

Home canning never proved more attractive than the present season. It seemed earlier in the season impossible to get any very definite information from canners or purchasers of fruits as to disposal of a crop at satisfactory prices. The grower with home canning facilities has been able to put his fruit into a form in which it can be permanently stored and the market awaited. It appears that canners are buying at prices which will make this season's profit cover their last season's losses. That is perhaps entirely allowable, but the grower prepared to protect himself has a great advantage. The best of it is that there are now home canning appliances which may be secured at reasonable prices. Some of the cruder home methods by which the wash boiler has been brought into use and ordinary kitchen utensils provided most of the other appliances were described in recent Cultivators.

In addition there are pressure outfits which make it possible for the grower to put up the fruit as safely in every way as the best equipped canneries. About the only handicap is that the grower has no established brand when it comes to marketing. We believe that through cooperation this objection may be overcome.

MISSED THE LADYBUGS

Says the Imperial Valley Farmer: "It is the concensus of opinion among cantaloupe growers that lady bugs can be used with good results in combating the aphis. For several years until this season ladybugs had been imported regularly to the valley and aphis did no considerable damage. Last year the state department of agriculture decided that the ladybugs had not done the work expected of them and none were shipped to the valley. The results have been apparent in the last three weeks during which time 13,000 acres of cantaloupes have been practically wiped out by the aphis, and an estimated yield of 750 carloads destroyed.

MAKING QUALITY RAISINS

(Continued from Page 125.)

the economic sense. On the other hand, to function properly the vine, like the human being, can not have all work and no play. That is, we should not expect to grow excessively large crops year after year any more than that a human being can long hold up under the strain of continued overwork. Sometime the breaking point will be reached and the productive ability decline until the conditions surrounding it are changed for the better.

Let us suppose you want to grow quality raisins. What is necessary? First of all study your conditions. Just because some one who is growing grapes on an entirely different soil than is found in your vineyard is able to produce three, or possibly four, tons to the acre is no reason to suppose that you can do the same under the conditions existing on your place. On the other hand, if you are producing only one-half ton of raisins it is not out of reason to believe that you can increase your production a great deal and have a better product. It is well to remember in this connection that if you are successful in producing fruit of good quality you will usually have little to complain about as to quantity.

Plenty of Water a Necessity

The value of plenty of irrigation water is perhaps little realized, and where it is realized, often too little care is taken to insure the application of water at such times that the vines will not actually suffer for water between applications. Many times the water may be applied to soils which naturally take it slowly, and without investigating one is led to believe a very thorough wetting has been given when in fact the water may have penetrated only a short distance below the surface. The remedy for these conditions, of course, is the soil auger. If this instrument, or implement, is used frequently and intelligently during the growing season, and the water applications regulated to conform with the story it truthfully tells, quality will become a fact rather than a hope.

Fertilization Pays

It is an established fact that the soils throughout the vineyard districts of the San Joaquin Valley are deficient in organic matter and nitrogen. With this knowledge at hand it is not surprising that the addition of manures or the growing of green manure crops is a wonderful help in increasing production and quality. The green manure question is of course a difficult one to solve, especially in vineyards of late ripening varieties. That the problem is not impossible, however, has been proven in a number of cases. With the addition of quantities of organic matter the question of water penetration and moisture retention becomes less difficult. In fact, it has been demonstrated in vineyard practice that even one good cover crop turned under and well rotted makes an appreciable difference in the water requirements of a vineyard. It is not fair to suppose that the fertilizer requirements of a vineyard stop at the growing of a green manure crop to furnish organic matter and nitrogen. Phosphoric acid, potash and, last but not least, lime all have an important place to fill when considering the application of plant foods, especially in the older vineyard districts.

Pruning for Quality

It would appear to be the height of folly to adopt any set rules for pruning in a vineyard when the conditions surrounding it are in such shape that the vine itself cannot properly function. With the proper application of fertilizers and the intelligent use of water,

Just Right for Plowing Under

A mass of green manure when turned under in the vineyard, especially if the plant is a legume, is an important step in improving the quality of raisins.

in a few years the vineyard will give an indication of what it can normally accomplish. There the skill of the pruner is required to leave just enough fruiting wood that the vine will be able to produce a maximum crop and still mature enough good strong fruit wood to insure a crop the following year. The grower who has studied his vineyard with such care that he can successfully maintain this balance of fruit and wood over a period of years is indeed entitled to be called a successful vineyardist. On the other hand, if a grower so prunes and handles his vines that he sacrifices quality, even though he may be able to grow a tonnage far greater than ever before produced, he is just as surely a failure when measured by the standards of the consumer, who after all is the ultimate judge of his efforts.

Other Factors Influencing Quality

The other important factors influencing quality are briefly stated. Insects and diseases which damage the fruit or defoliate or in any way weaken the vine must be fought and eliminated if possible. It should be remembered in this connection that the weaker the vine, whether the cause is lack of water or insufficient plant food in the soil, the more apt it is to be injured by these parasites and the poorer the quality will be. Insects and diseases are usually easily controlled if the proper remedies are applied in time, and the fact of their existence should not discourage the progressive grower.

The big need is for the grower to study and understand his particular conditions, and when he finds the reason for failure or success to act accordingly to the end that the California raisin may be of such quality that the efforts expended in advertising and marketing may have more than a fighting chance for success.

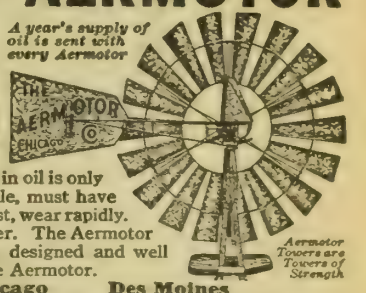
THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

A year's supply of oil is sent with every Aermotor



Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

LIFE

Life is not strife for gold
Nor metaled fame,
Its years in joy are told—
The hearth fires flame,
The roses nodding in the sun,
The children's happy feet,
Some little duty done,
A pleasure fleet.
Life is the joy of friends
And birds and trees,
The notes the lover sends,
Old memories,
Neighbors and sunny skys,
And little trips to make,
Tears when a loved one dies
And hearts that ache.
Life is a sum of things,
Laughter and cheery days,
Hope which the morning brings,
The future's rosier ways,
Faith when the clouds are gray,
Grief when the shadows fall;
So we must go our way
Knowing them all.

— Edgar A. Guest

The leanest people are those who try to keep all they get.—Associated Grower.

A HOME FOR JACK-O'-LANTERN

(Concluded.)

The song went on, and the woman with wistful brown eyes and tender lips turned impulsively to her husband.

"Isn't it beautiful, George?" she asked. "Aren't you glad you came?"

The man nodded and patted her hand.

It was not right. These were Ralph's parents. Miss Leech, being detained by one of the doctors, had asked Ruth to take this man and woman to room 211, and now on the very threshold Jack was singing them away from Ralph. Ruth tried to speak, but the woman put her finger to her lips. Her eyes were filled with tears.

"Let every heart prepare Him room
And heav'n and nature sing,
And heav'n and nature sing—"

Ermina came close to them. So engrossed had she become in the success of her scheme that she had forgotten Ruth.

"He is very plain," she whispered. They had reached the threshold of the room.

"Plain!" repeated the woman. "Plain! Look at him, George!"

Neither of them glanced toward Ralph with his soulful dark eyes and pensive mouth. Their eyes were upon Jack-o'-Lantern, and, sitting there, singing for a father and a mother, Jack-o'-Lantern was almost beautiful.

The woman went swiftly across the room and, kneeling by his bed, touched his hand.

"My little boy," she said, "would you like to come with us and be our little boy?"

"Sure," said Jack-o'-Lantern. "I was looking for you."

"It all came out just as I planned," said Ermina, squeezing Ruth's arm. "A home for Jack-o'-Lantern."

"But, Ermina, it isn't right, not a bit. That was Ralph's home, and those were to be Ralph's father and mother. They're wonderful people, and Ralph would have had a wonderful home."

"You mean Jack will have. After I saw that man and woman I couldn't have done differently, Ruth. I just had to have them for Jack-o'-Lantern. Others will want Ralph, he's so good to look at, but I promised Jack—" Conviction died out of Ermina's voice. She was not quite sure. She had never been quite sure.

"Poor Miss Leech," she said contritely. "I'm always confessing to her, and she's always forgiving me. There may be a limit to her forgiveness, Ruth. What do you think?"

"I don't know, Ermina, really, I don't. I wanted a home for Jack just as badly as you did, so badly that I didn't dare ask you about your scheme. I—I hoped it would work. I wasn't smart enough to think up one myself. If you go to Miss Leech, I will, too."

"I know what I'll do, Ruth. I'll tell that woman, Jack's mother. I'll ask her what we ought to do. She'll know."

Accordingly they drew Jack's new mother just outside the door, and Ermina began her story just where she should have ended it.

"Ruth Keniston says it was almost like stealing—having him sing like that—just at the right time. He always wins people when he sings, but at first—if he doesn't sing—he's so plain in spite of his grin, and he hasn't a very good way of expressing himself—except of course in music. Jack-o'-Lantern is really smarter than Ralph. Your husband will be surprised how much he knows about baseball—all the big pitchers' names and everything. Fairies, too—I told him to sing in hopes that a fairy would—"

"It was lovely to hear him sing then—just at the right time. I knew as soon as we heard him that my husband would—but I think anyway we—"

"I should have given Ralph his chance, though. It wasn't square."

"My dear girl, I can't get it through my head what you've done that isn't square. If it helped to give me my little boy, it couldn't have been very crooked."

They had been talking so busily and were so intent upon each other that they had not seen three people who, entering the corridor, had come down through it until they stood upon the threshold of room 211. Miss Leech and another couple, man and woman, were looking in at the boys.

"There he is," Miss Leech was saying. "I am sure he will be just what you wish. He is eight years old. We know of his parentage. His name is Ralph—a quiet boy of excellent mentality—"

Ermina's eyes flashed, and Ruth's pale cheeks were as pink as primroses.

"You didn't—then you didn't come for Ralph at all!" gasped Ermina.

"Oh, my dear!" said Jack's new mother, and she began to laugh. "Is that what worried you? You thought I had come for Ralph and that Jack's adorable singing had turned me away from him? I never once thought of Ralph. I had never heard of him. I've been here in the hospital, in the surgical ward, for two weeks, and I've heard Jack sing every morning. I sent for my husband so that we might see him for the first time together. We had a little boy of our own once. Plain and freckle-faced—" She hesitated, then went on gayly, "I was about ten days ahead of the fairies. I—we came for Jack-o'-Lantern."

"It won't be necessary for Miss Leech to forgive you this time, Ermina," Ruth said as they skipped toward the nurses' home.

"Will you, Ruth?" asked Ermina.

HOUSEHOLD QUERIES

Salads and Sandwiches

I am very fond of salads and sandwiches. Would the California Cultivator print some more recipes for them?—Lola McKenzie, Douglas City.

Canning String Beans

Could you reprint the recipe telling how to can green string beans? It was printed last summer and called for vinegar, sugar and salt. I lost my recipe.—Subscriber, San Dimas.

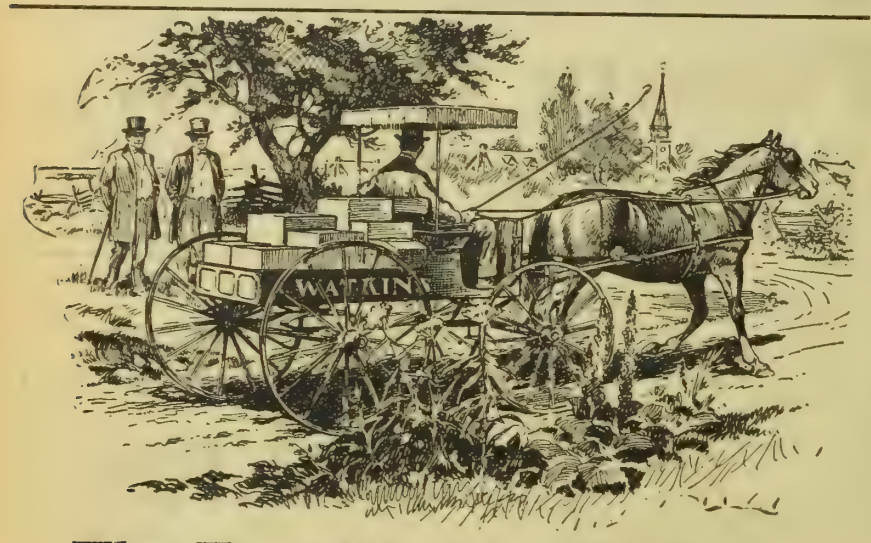
This recipe was given last September in the Cultivator by S. G. B., who wrote that she had used it several years and found it simple, quick and satisfactory, that she "never lost a jar of beans canned by this recipe, and others who have tried it like it very much: To half gallon fresh string beans add ½ cup vinegar, 2 level tablespoons salt, 2 level tablespoons sugar. Add water to cover beans and boil 20 minutes after they come to boil. Seal while hot. In winter I pour off all the water and cook as fresh string beans."

Cement Floors

We are contemplating building a concrete bungalow, Mission style, and were considering a concrete floor. We should be greatly obliged to hear from some of your readers through your columns as to how the housewives like the concrete floor.—Subscriber.

Our impression is that the concrete floors will not be entirely satisfactory in living rooms. We have known of their being laid, however, and then covering with strips of flooring. In

(Continued on Page 140.)



The First Watkins Wagon

THREE short years after the close of the Civil War—and in the year General Grant was made President—a primitive Watkins wagon like the above ventured forth over the countryside.

The first Watkins wagon has now grown to **thousands** of automobiles and wagons. The first handful of Watkins customers has increased **to twenty million satisfied users!** Today, more than 4,000 Watkins Men are kept busy supplying the demand.

Why this tremendous growth? Service; and saving; and quality—that is the answer. Watkins products—**delivered right to your home**—mean convenience in buying. Watkins products—sold **direct to the user** through authorized Watkins Retailers—mean economy. Watkins products—put to the test for more than fifty years—mean **quality you can bank on!**

You gain by holding your orders till the Watkins Man calls at regular intervals. Do it. If a Watkins Man has not called recently, write to us—and we'll gladly see that you are supplied.

137 Quality Products

are brought to your home by the Watkins store at your door. Among the 137 Watkins products are: Livestock and Poultry Preparations; Household Medicines, Liniments, Balsams; Spices, Extracts, Coffee, Baking Powder, Washing Compound, Tube Flavors; Soaps, Shaving Cream, Perfumes, Toilet Waters, Face Creams, Powders, Tooth Paste, Tooth Brushes; Automobile Supplies, Tires, Tubes, Spark Plugs, etc;

Montgomery Ward & Co.

New Fall Catalogue

One Copy is YOURS FREE

TODAY, one must compare prices. YOU must learn what you should pay before you buy. You need to make sure that you are really getting the full benefit of the big break in prices.

Montgomery Ward & Co., the Original Mail Order House, has for over forty-nine years been dealing fairly with the public—been telling the truth about its merchandise and its prices.

Today, every page in this big book tells the truth about present-day prices, and puts before the public the prices that should be paid for everything you buy.

WARD'S— The Oldest Mail Order House is Today the most progressive

Ward's today is filled with the spirit of Youth, of Aggressiveness—alert, progressive, forward looking—and is marching forward in giving even better service, even better merchandise, and always lower prices.

Every page in this book breathes the Spirit of Ward's—that of progress in Service and Saving—for YOU.

FOR WOMEN: Wonderful materials at prices that have not been possible for years—such as: "All-wool storm serge which sold for $2.28 a yard last year is now 98 cents per yard; 32-inch chambray is down from 38 cents to 14 cents a yard; 32-inch dress gingham which was 44 cents last year is now 19 cents per yard; 40-inch colored voile has been reduced from 59 cents to 26 cents a yard; good quality 27-inch outing flannel from 39 cents to 14 cents per yard.

And clothing, the daintiest underwear, corsets that give just the right figure and comfort, hose, shoes, toilet articles—everything for women's needs, all of the most beautiful and newest styles—at prices remarkably reduced.

FOR MEN: New Worsted Serge Suits are down at Ward's from $28.75 to $15.95. Men's Reversible Mackinaws are down from $16.95 to $10.95. Boys' Rain-Proof Corduroy Suits from $13.95 to $9.00. Men's Chambray Work Shirts are down from $1.75 to 69c. And so the price story runs on page after page of Ward's New Catalogue and Buyers' Guide.

FOR THE HOME AND FARM: Blue denim is down from 54c to 19c. A four-piece Ivory Enamel Bed Room Suite was $134.00, is now $82.45. Matresses are down from $25.50 to $13.95. Team Harness from $118.25 to $80.75, 100 feet Canvas Belting, from $80 to $29.50.

These are but examples of the Saving Your Copy of Ward's New Catalogue offers you. Every page is filled with similar big savings. And remember, all prices are for standard goods, merchandise of Ward Quality—all sold under our 49-year-old guarantee—Satisfaction or your Money Back.

MOLASSES

"I have been feeding Cane Molasses for years" writes Mr. H. L. Wakeham, of Santa Ana

And there are scores of other successful dairymen in California who have had the same experience that Mr. Wakeham mentions; they have found that Camo Pure Hawaiian Cane Molasses is a stock feed that can be fed the year around to cows on test or production, day in and day out, **and at a decided profit.**

Here Is Where the Profit Lies

By adding Camo Pure Hawaiian Cane Molasses to your cheaper roughages, such as straw, you can convert an otherwise wasted feed into a profit maker for you. There is nothing that so pleases the appetite of a cow, or acts so beneficially as a tonic as Camo Molasses. Get all the details. Write for our **new and lower prices** and booklet.

We have assembled an excellent foundation herd of females and will be glad to have breeders call. Fred Hartsook, Lankershim, California.

Sir Aaggie Hiske Walker

SHOW TYPE and PRODUCTION

He was first in two year class at Riverside last year.
His dam is a 34 lb. daughter of Prince Gelsche Walker.
His sire is the 36 lb. Morris bull—Sir Aaggie De Kol Acme.
A limited number of approved cows will be accepted for service.

E. D. BARRY, JR. Workman and Azusa Ave., Covina, Cal.

Guernsey Meet in Humboldt County

A SPECIAL meeting and general jollification of Humboldt County Guernsey breeders and their families was held recently on the C. S. Rasmussen farm near Loleta, nearly 100 enthusiastic Guernsey fans participating.

During the forenoon the notable Rasmussen herd of Guernseys was inspected by the assembled breeders. Rasmussen has a herd that is attracting nation wide attention, the remarkable records of his mixed grades and pure breds being the subject of comment in many Eastern breeding journals and magazines. The history of the herd and the systematic way in which it was built up was given later as a part of the afternoon program.

One of the livestock experts present at the meeting was E. L. Westover, western representative for the American Guernsey Cattle Club, and before noon Mr. Westover gave an interesting demonstration of the breeding points upon which Guernseys are judged, utilizing a number of the Rasmussen Guernseys as subjects for his demonstration and address. Among these Westover made an earnest appeal for the continued cooperation of all the breeders in boosting not only for their own organization and the Guernsey breed, but for united efforts and enthusiasm in working for the upbuilding of all the dairy breeds in neighboring localities. He stressed the three great points of the Guernsey breed in the phrase: "Economy of production, quality of product, and ruggedness of constitution," and urged the assembled breeders to take a lesson from the Guernsey cow (noted for her persistency in production) and persist tirelessly in developing and promoting the dairying industry, with especial efforts for the Guernsey breed.

STOCK JUDGING CONTEST

"Summer Doings at Chaffey" reports as to the first annual stock judging contest recently held by the animal husbandry class at the Italian Vineyard Ranch as follows:

"There were 33 contestants and keen rivalry was displayed. Besides the contestants there were many others who were placing the animals and getting ideas.

"There were four classes of stock: Guernsey cows, Duroc-Jersey aged sows, Berkshire aged boars and Berkshire aged sows. The contests were divided into two parts: First, the placing in the order of rank; and second, the giving to the judges of the reasons for this placing by each contestant.

"The judges were Prof. E. H. Hughes of the college of agriculture of the University of California; Prof. R. A. Condee of the George Junior Republic and the Chaffey Junior College of Agriculture, and Robert Walker of the Diamond Bar Ranch.

"The ribbon winners in the Guernsey cattle division were: 1st, E. D. Woodhouse; 2nd, F. E. Onyett; 3rd, John Bartlett; 4th, J. D. Kirkpatrick.

"The successful contestants in swine judging were: 1st, N. H. McCollom; 2nd, F. E. Onyett; 3rd, E. D. Woodhouse; 4th, R. W. Merrick.

"The championship ribbon awarded for the total highest number of points for both cattle and swine was presented to E. D. Woodhouse. The ribbons for this contest were given by the Southwestern Berkshire Congress.

"One of the most enjoyable events of the contest was the fine collation given by Alex M. Wilson and family at the noon hour. All visitors and contestants did ample justice to it and came away singing praises of their royal treatment."

A Quartette of Winners

Four grade daughters of Pacific May King Masher 41595, (sired by Isabella's May King of the Pacific, 30775 and out of Golden Rod of Chestnut Hill, 25501) owned by C. S. Rasmussen of Humboldt County. From left to right these cows and their records are: Queen, 449 pounds fat in ten months; Horney, 318 pounds fat in nine months; Guernsey, 452 pounds fat in ten months; Buck, 500 pounds fat in ten months. These records were all made as two year olds on two milkings daily, running in pasture and receiving no grain.

was Rasmussen's outstanding herd sire, Proud King of Edgemoor, one of whose two year old daughters made an average production of 413 pounds fat in Rasmussen's herd, this record being made on two milkings a day with the cows running to pasture and receiving no grain. Three other two year old daughters of this bull made, under the same conditions, records of 388 pounds fat in nine months, 380 pounds fat in ten months, and 375 pounds fat in ten months.

The mid-day feature of the Guernsey meet was a bountiful luncheon, served temptingly at two long tables. At its conclusion a program of addresses and discussion of Guernsey topics was launched. Clyde E. Niles, superintendent of the River Banks Farm at Grants Pass, Oregon, was among those who spoke. He told of the work being done on this farm and the results of various experiments. He expressed much surprise at the wonderful natural conditions favorable to dairying and the breeding of dairy cattle in Humboldt County. Among others who spoke were W. A. Beer of Arcata, C. S. Rasmussen, Charles Ford of Arcata and L. D. Smith of Hydesville. The main address of the afternoon, however, was given by E. L. Westover, who mentioned in his talk the fact that Humboldt County has the national record for its average production of grade cows, this average being higher by a goodly margin than the production record of any like number of cows in any county in the United States. This is largely due, he said, to the excellent natural dairy conditions, the good and intelligent care given to the cows, and to the fact that many of the high producing cows can be traced back to the good old Guernsey sire, Hemlock, the first pure bred bull to be brought to the county. He emphasized the need of securing better bulls to keep up the high average.

Melba 15th of Darbalara, a red Shorthorn cow, has established at 21,635 pounds milk and 954.5 pounds butter fat in a year, an average butter fat test of 4.41 per cent, a new world's record for both milk and butter fat for Shorthorn cows. Melba is owned by the Scottish Australian Investment Company, and is one of the Shorthorn cows on the Darbalara Estate in New South Wales.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

October 4, S. O. Walker, Visalia.
October 5, Robt. T. Curtis and Son, Tulare.
October 6, Alex Whaley, Tulare.

Herefords

October 27. Pacific Coast Hereford Breeders' Association, California National Livestock Show, San Francisco.
November 1, J. H. Cazier and Sons, Sacramento.

Shorthorns

October 28, California Shorthorn Breeders' Association, California National Livestock Show, San Francisco.
November 2, W. M. Carruthers, Live Oak.

J. D. Rowe and Sons, Davis, lessees of the famous Innisfail herd of milking Shorthorns, are planning an extensive exhibit for the fall fairs and will include in their circuit the state fair, Stockton, Fresno and Hanford, the California National, the Pacific International at Portland and the Western Royal Show at Spokane. At present 15 cows are on semi-official test and all are making splendid records. Messrs. Rowe experience a very active demand for the surplus of the herd and are usually sold down very close.

Harvey M. Berglund of Dixon has sold two Duroc service boars to a South American buyer; one to R. Sale of Red Bluff and one to the Eldorado Ayrshire Farm, Knights Landing. Berglund says that many farmers are becoming interested in pure bred hogs as a means of marketing a part of their surplus barley.

R. R. Engle of the Englehaven Ranch, Ukiah, recently visited the Shorthorn herd at Caledonia Farms, West Sacramento, and purchased six well bred females, four of which had calves at foot. In addition Mr. Engle secured 12 head of unregistered Shorthorns from Senator B. F. Rush of Suisun. Mr. Engle is just entering the pure bred business and hopes to build up a creditable herd.

Secretary Paine of the California state fair announced last week that he has secured the services of the well known Poland China judge, J. C. Meese of Nebraska, to tie the ribbons in the Poland classes. Meese is one of the best known swine judges of the cornbelt and for years has officiated at the leading shows.

Homer L. Graham, manager of the Eastman Ranch, San Fernando, has recently added several very high class sows to the Eastman Poland China herd. Three junior yearlings were secured from the Glover herd in Missouri and include a daughter of Giant Buster, one by Checkmaker and one by K's Big Jones. It is expected that all three will be shown at the coming state fair.

H. C. Witherow of Live Oak and Clayton Slocum of Willows are each getting ready to cop off the special prize offered by the American Duroc Jersey Record Association for the best five sows farrowed between March 1, 1920 and March 1, 1921. Witherow will show junior yearlings and Slocum will have out senior sow pigs. This prize was offered last year but no exhibitor qualified.

Miss Aaggie Acme Burke, the great Young Holstein cow owned by A. W. Morris and Sons of Woodland, whose record of 24,338.9 pounds milk completed last spring was a world's record for age at that time has been on test for seven months and in that time has to her credit 18,393.1 pounds milk and 825.68 pounds butter.

July 29th, 1921.

California Cultivator,
Los Angeles, Cal.
Dear Sir:

Received your letter of July 20th, with the enclosed check for $25 for the California Cultivator prize for the best record of five grade cows during the month of June, for which I thank you very much. Also many thanks for your good wishes.

With best wishes, I am,
Yours truly,
Nate Hauck.

Twenty-seven California Jerseys representing 10 herds appear in the list of Jerseys that produced 50 pounds butter fat during the month of April. T. B. Purvine of Petaluma heads the list with seven; J. W. Coppini of Ferndale is second with six; Dr. H. G. Gross of Eureka is third with four. The California leader is Fairy Boy's May Margaret, owned by T. B. Purvine, with 88.63 pounds fat to her credit.

Mollie, a Canadian Milking Shorthorn cow, has given 11,938 pounds milk and 711 pounds butter fat in a year, breaking the American butter fat record and being the first American Shorthorn to make over 700 pounds butter fat in a year. The new record displaces the record made by Snowdrop of Sherwood Farms, Far Hills, New Jersey, that completed a record of 15,550 pounds milk and 691 pounds butter fat last fall.

THE LICE AND THE HOGS

At this time of the year did you ever notice a bunch of hogs when not eating, rubbing themselves against the fence and hog houses apparently trying to shake the structures to pieces and at the same time emitting grunts suggestive of delight at the destruction of property?

There is no doubt that the rubbing produced a feeling of delight, but their evident joy was not due to the fact that they were demolishing their rubbing places! A careful examination of the hogs, most busy at rubbing, will reveal the well known parasites commonly known as hog lice. Sometimes one may fail to find the parasites but will note small yellow deposits on the bristles, particularly on the back portion of the neck. These yellowish deposits are the eggs of the lice destined to become full grown pests to further annoy the host.

In seeking the parasites on a lousy hog you will most frequently find them on the ears, neck, flanks and inner surfaces of the legs. Observant hog raisers inform us that hundreds of dollars are lost annually through unthriftiness of their hogs due to these pests.

There are various simple methods of ridding hogs of lice. When dipping is impracticable waste oils from tractors will be found to be cheap and effective. Get the oil on the louse or the egg and as the old hog man says, "It will do the trick!"

Some hog raisers construct home made oilers by wrapping an old sack around a post in the hog lot and keeping it well oiled. This serves as a "scratcher" and an automatic oiler. Another method is to crowd the hogs into close quarters and spray them with oil. Kerosene emulsion is also known as an effective louse destroyer. Where the premises are infested, any effective preparation must be repeated from time to time if the hogs are to be kept practically free from louse annoyance. When oily preparations are applied to hogs, care should be taken that they are not unusually warm as the oil has a tendency to interfere with radiation through the skin.

PURE BREDS PAID A THIRD MORE

The Pettis County cow testing association has shown conclusively that pure bred dairy cows in the right hands are more profitable than grades, according to E. M. Harmon of the Missouri agricultural extension service. A comparison of the production and profit of the pure bred cows owned by the Pettis County Holstein Company with all other cows in the association during the past year showed that the pure bred produced a net profit nearly 40 per cent greater than the grades.

It is significant also that the pure bred cows owned by the company were kept in farm herds with other cows included in the test. The records show that the pure breds averaged 7,782 pounds of milk, 269.4 pounds of fat and a net profit of $115.63 a year. The grades averaged 6,127 pounds of milk and 239.9 pounds of fat and a profit of $83.01 a year.

A well filled self feeder and a thrifty shoat make a combination which is hard to beat for quick returns, large profits, little labor and diminished risk.

AUCTION

Holt Caterpillar & Implements
20 Head of Horses 20

On the Von Schriltz Ranch, 4½ Miles Southwest of SANTA ANA

Wednesday, August 10th at 10 A.M.

It is seldom that buyers have an opportunity such as this to secure Caterpillar implements at your own price. Included is a Holt 60 Caterpillar engine, 1 extra heavy Killefer Mouldboard plow, 4 gang with subsoilers, 1 16-inch Killefer Mouldboard 2 gang plow, 4 14-inch deep tillage Oliver engine plows, 3 and 2 gang, 2 16-inch heavy 2 gang engine Jumbo plows, one 12-inch 2 gang power lift John Deere engine plow, 1 heavy 5 gang Holt engine disc plow, 2 heavy 5 and 8 gang Sanders disc plows, etc. There are a large number of other implements for beet and bean farming to be sold. These implements are all in A-1 condition, many being used only one season. The work stock is extra good. If you are in the market for a Caterpillar and heavy Caterpillar tools, don't miss this big closing out sale.

WHY NOT STOCKYARDS?

By A. L. Spellmeyer

CALIFORNIA has in the past boasted that the fine price it enjoyed for livestock was because California had no stockyards. California with its five cent fat cows and six cent fat steers f. o. b. ranches is not, in view of a top Eastern market at 8.50 to 9.75, boasting today.

Credits in the cattle line are at present frozen. The strongest argument any man can make for a stockyard, preferably owned and supported by associated cattle, sheep and hog men, is that such yards mean a concentration of livestock, buyers and sellers, and easier loans with a certain outlet.

We all know livestock are cheap, and that now is a great time to start into the business, if one has feed and money. We all know livestock will not continue to sell at the terrible loss prices today prevalent and that when the turn comes every man in this country will be trying to get into the livestock business. We know today a man can't get a half dozen cars of hard fed hogs in Southern California and that it will be equally as hard within a short time to get a half dozen trains of fat cattle for our city people.

Livestock will come back through the small men, and to insure the small men's interest in cattle or sheep or hogs there must be a market for their goods, not a presentation of any small lots, as exists today. Without a stockyards men have no focus; they don't know what to pay or what they can get or when they can get it.

The great argument against a stockyards is made that there will be market gluts, that when people arrive they must sell at any price given and that feed will eat them up.

You Cultivator readers know very well from the past that the California Cultivator has always been pro-producer. You know it was opposing meat packers' bad practices when such action was almost unique, and in any consideration of the stockyards question there is no hidden incentive on the part of this paper or myself personally in writing this.

This stockyard question to my mind is merely the establishment of a modern facility to promote trade. It's a question to my mind, here in California, of the small man in the livestock business. I believe our bulk meat supply of the next decade or later must come from the small men, that our farms need more cattle and that our people and communities will be more prosperous with a general diversified farm effort that must be based partly upon cattle and sheep and hogs, and that such small lots must have a ready cash market instead of being penalized as at present one to two cents or more per pound for being a small instead of a large lot. Stockyards will give the cash market.

The principal argument against a stockyards is market gluts, etc. I do not consider this point well taken. East of Los Angeles where the northern Arizona and Utah cattle would enter this market there are from Riverside to El Monte great alfalfa acreages, together with hill lands, that cattle associations could lease for holding up and resting of cattle. North of Los Angeles the San Fernando Valley offers a resting place in hill pasture and alfalfa for coast and northern cattle. Almost any place within 20 miles of Los Angeles are facilities to rest and hold up cattle for 30 days to the extent of 20,000 head if desired, at a total cost of ten cents per head per day. The least intelligent action on the part of the cattle and sheep associations would in this wonderful, snowless, all year grazing in the open country prevent any serious gluts.

The concentration of buyers and sellers would promote a competition that could certainly hurt no one, and loans would be easier when there was a definite outlet.

State Dairy Cow Competition

By Prof. F. W. Woll

List of cows producing 50 pounds of butter fat or over during June:

Adohr Stock Farms, grade Guernseys: C-269, 1,239 lbs. milk, 56.99 lbs. fat; C-115, 1,485, 51.98.

Arden Dairy, grade Holsteins: 982, 1,776 lbs. milk, 78.14 lbs. fat; 58, 1,488, 55.06; 48, 1,542, 50.89; 976, 1,176, 50.57; 203, 900, 50.40.

Anita M. Baldwin, Holsteins: Ellen Walker Hartog, 1,704 lbs. milk, 50.78 lbs. fat.

Dean Beeman, Holsteins: Jacobina, 2,168 lbs. milk, 63.74 lbs. fat; Bernice NaDean DeKol, 1,739, 61.37; Capunista, 1,824, 55.64; Bylaria, 1,518, 52.57; Jean NaDean DeKol, 1,373, 50.81.

Eug. Biondini, grade Jerseys: Twinnie, 1,334 lbs. milk, 73.10 lbs. fat; Brownie, 1,413, 71.78; Midget, 1,542, 71.70; Rosalie, 1,119, 71.17; Rachel, 1,560, 70.98; Shortie's Best, 1,205, 70.49; 1910, 1,490, 67.94; Hannah, 1,194, 64.48; 62, 1,025, 62.73.

Bonnikson Bros., Jerseys: Financial C's Loretta, 1,051 lbs. milk, 61.82 lbs. fat; Bonnie's Financial L., 845, 51.49.

N. L. Browning, Holsteins: Segis DeKol Bess, 1,919 lbs. milk, 61.21 lbs. fat.

Leo Christen, grades and Jerseys: Mama Jersey, 1,584 lbs. milk, 86.65 lbs. fat; Buttercup, 1,200, 73.08; Black Beauty, 1,560, 63.18; Young Lumpjaw, 1,869, 61.63; Blue, 1,683, 61.60; Newberg, 1,773, 57.98; Mousie, 1,119, 55.17; Roane, 1,230, 54.24; Lily, 1,311, 52.18; Daisy, 1,146, 51.34; Coaly, 1,257, 51.16.

D. F. Conant, Jerseys: Lady Kate's Rosette, 994 lbs. milk, 53.20 lbs. fat.

J. W. Coppini, Jerseys and grades: Noble's Sayda Polo, 910 lbs. milk, 67.68 lbs. fat; Lady Mc, 1,478, 65.92; Hazel Marigold of F., 1,094, 62.77; Olga Fern's Olga, 1,141, 61.26; St. Helier's Mabel Darling, 961, 58.04; Olga Fern Smith, 873, 52.03; Marigold of F., 902, 50.23.

L. A. Driver, Holsteins: Anselmo DeKol Burke, 1,879 lbs. milk, 57.13 lbs. fat; Miss Gerben Colantha F., 1,735, 56.56.

W. F. Early, grades: Rose, 1,434 lbs. milk, 71.41 lbs. fat; Little Darling, 1,160, 61.83; Butterfly, 1,374, 61.14; Little Rose, 1,601, 57.16; Humboldt Maid, 996, 56.77; Pencil, 1,316, 55.44; Roany, 1,494, 54.83; Granny, 1,428, 54.26; Cripple, 1,140, 53.58; Goldie, 1,128, 53.02; Novene, 1,050, 51.98; Black Ward, 1,118, 51.43; Lineback, 1,038, 51.28; Pet, 1,266, 50.77; Creamcup, 974, 50.06.

M. J. and B. A. Edwards, Holsteins: Sarcastic Dora of M., 1,686 lbs. milk, 57.32 lbs. fat.

El Mirador Dairy, grade Holsteins: 53, 1,311 lbs. milk, 59.00 lbs. fat.

J. A. Genzoli, grades: Dollie, 1,883 lbs. milk, 88.50 lbs. fat; Blue Spot, 1,586, 76.29; Jill, 1,260, 74.09; Princess, 1,226, 73.56; Fannie, 1,289, 73.47; Sarah, 1,382, 69.51, Brownie, 1,149, 67.79; Pansy, 1,268, 65.48; Baby, 1,341, 63.16; Star, 1,082, 59.51; Josie, 1,146, 59.25; Maggie, 1,010, 58.68; May, 957, 52.54.

Giacomini & Perlotti, grades: Georgie, 1,149 lbs. milk, 59.75 lbs. fat; Pearl, 1,062, 58.41; Roan, 1,086, 57.56; Gladys, 1,284, 56.50; Pearl Smith, 966, 51.20; Sassy, 1,083, 50.90; Six Teats, 900, 50.40.

Earl Graham, Holsteins and grades: Niger, 1,830 lbs. milk, 76.86 lbs. fat; Princess Maida Veeman, 2,690, 76.14; Pinkie, 1,671, 75.20; Gamma Sarcastic of L., 2,114, 74.62; Pansy, 1,605, 70.62; Hauser, 1,776, 67.49; Cora Jarie Pontiac, 1,484, 62.63; Montana, 1,449, 62.31; Valentine, 1,575, 58.28; May Walker, G. K., 1,580, 55.30; No. 5, 1,350, 54.00; Peg, 1,221, 52.50; Black Emma, 1,305, 52.20; Miss Segis Pontiac, W., 1,351, 52.15; Smithy, 1,617, 51.74; Brownie, 1,254, 51.41; Tomie, 1,329, 50.50.

FROM A KODAK NEGATIVE

Kodak on the Farm

Kodak serves a double purpose on the farm. The pictures of the children and of the home, the Kodak story of the picnic, even the snap-shots of the pets go to make the Kodak album the most thought of book in all the house.

But there's another side to picture-making on the farm—the business side. Pictures of live stock help in making sales; pictures of the orchard and of growing crops help in keeping worth while records; pictures of the line fence and the "party ditch" prevent or settle arguments—oftentimes can prevent arguments from growing into lawsuits.

To the up-to-date farmer a camera is no longer a luxury. It's a necessity. And picture-taking by the Kodak system is simpler and less expensive than you think.

Ask your dealer or write us for catalogue of Kodaks and Brownies. It's free.

EASTMAN KODAK COMPANY. Rochester, N. Y., *The Kodak City*

Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 40,000 subscribers. Weekly Liner rates: Single insertion 4½ cents per word; 45c per issue minimum charge. Cash with Order

Polled Herefords and Durocs — Diablo Stock Farm, G. W. Emmons, Prop., Danville, California.

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Golden Beetles

Here are specimens of beetles having a metallic or even golden appearance. What are they?—Subscriber.

These beetles have been sent the rounds and Harry Smith of the state insectary identifies them as follows:

"This is one of the Hoplia beetles which belong to the June bug family. The larvae breed on the roots of various plants but the adults at times become quite abundant and do serious damage to various fruit trees and berries. They are rather difficult to kill with arsenical poison and unless the infestation is covering a large area the best method of handling them is to jar them off the plants in the early morning onto sheets of paper covered with crude oil or into vessels filled with oil."

Capri Figs Dropping

My capri figs dropped early this season from the tree and am left no fruit for caprifying the orchard. What is the cause?—Subscriber, San Diego.

This question was referred to G. P. Rixford of the U. S. department of agriculture, located in San Francisco and he replies:

"As to the cause of the dropping of caprifigs would say that if he refers to the overwinter, or mamme crop, which has been extensively lost during the past winter, the principal cause of dropping was injury by frost. The loss of the overwinter crop, containing insects which oviposit in the spring, or profichi crop, so reduced the number of blastophaga that only a very small portion of the spring crop was oviposited in by the insect. All such figs turn yellow and fall off. These figs contain the usual cluster of staminate flowers, but none of the galls that constitute a perfect caprifig. It is a curious fact that the presence of the larva of the insect in the saprifig is just as essential to make the caprifig hold on and mature as is the pollen in the Smyrna fig to cause it to hold on and mature. This is one of the most interesting features (so-called symbiosis) of the insect and the plant known to botanists."

Strawberries Don't Bear

I planted about 200 strawberry plants in 1919, but have never had a crop of berries. The plants are vigorous and are always covered with blossoms. I have been told that they need mates. Is this the cause of my trouble?—Subscriber, Placerville.

Presumably this is a case of lack of pollination which would be corrected by planting strawberries having flowers of other sex than those now planted. The subscriber does not give name of the variety. Of course there are many strawberries which bear complete or perfect flowers and pollination from other varieties is not needed. Planting along this row of berries a staminate variety will probably change your conditions and you will get good crops from the vigorous plants. Any nurseryman or plant dealer can tell you which of the varieties are self fertile. Most of the new varieties are self fertile and do not need this interplanting. Presumably there are nurserymen in your own town; certainly there are in Sacramento. The Valley Seed Company, Sacramento, can give you fullest information as to the proper plants.

Canada Thistle

In a recent issue someone asks how to exterminate Canada thistle. When I was a girl back in Michigan my

father put the Canada thistle patch on pasture and in three years time they were about all gone. You cannot hope to eradicate them so long as you cultivate your soil. I would say cut and burn as well as pasture them.—Mrs. Luade Miner, San Diego.

Soft Brown Scale on Fern

I am inclosing a piece of my Boston fern, which upon close inspection I find has little brown bumps on it. Is this some kind of a scale? If so, what treatment would be advisable? These bumps, which look like little ticks, are on all of the old leaves on the fern and they are white and woolly inside.—Subscriber, San Marcos.

The fern fronds were infested with soft brown scale, one of the easiest to control or exterminate. It is best to pick off and burn all old scale. If too many, cut off old fronds and burn. Then pick scale off from remainder and dip or spray in strong soap suds and repeat once each week for four weeks. Soap suds destroy the young scale and will not harm the fern. Place one hand on soil so it will not fall out and turn fern upside down to dip in basin or bucket of suds.

Globe Artichokes

What soil and culture do artichokes require? Can you take the offshoots from the old plants, and when?—Subscriber, Santa Paula.

Heavy soils, retentive of moisture, are best for artichokes. They are both thirsty and hungry at all times and may be fed heavily with barnyard manure. Offshoots may be removed at almost any time of the year, except during cold weather, and will readily root if sufficient base is taken with the young plant. The culture is not difficult as the plants escape from gardens and run wild in low damp lands.

Avocados at Belvedere

About eight months ago I planted the seed of an alligator pear in water. It has grown to the height of two feet and is now planted in a pot of soil and is still growing. Do you think it would grow if I planted it in my garden in Beldevere, Marin County (an island very warm during the day but cold at night)? Do you think it would bear fruit?—Subscriber, San Francisco.

Certainly it is worth the trial to put these trees to a test at Belvedere. The avocado has shown its liking for coast influence but not so severe a coast influence as that about San Francisco Bay. However, the eastern and southern slopes of Belvedere are wonderfully protected and it is barely possible the avocado might live, but we fear there are not enough heat units to permit the production of high grade avocado fruits. The avocado has been planted successfully from Tulare and Fresno Counties to the southern part but its best development seems to be several miles inland and yet near enough to the ocean that the greater valley heat is tempered.

STATE DAIRY COW COMPETITION

(Continued from Page 137.)

Colantha Rose, 2,677 lbs. milk, 75.22 lbs. fat.

Walter Terkelsen, grades: Christina, 1,539 lbs. milk, 84.18 lbs. fat; Laura, 1,467, 78.04; Amy, 1,077, 72.59; Annie, 1,302, 70,18; Dinah, 1,455, 66.49; Friday, 1,058, 63.06; Pale Face, 1,860, 61.75; Ethel, 1,046, 60.46; Evelyn, 1,442, 59.12; Edna, 977, 59.11; Lucy, 1,220, 56.12; Monday, 932, 54.52; Babe, 1,044, 53.14; Lena, 1,032, 52.22.

H. L. Wakeham, grade Jerseys: Jim's Wonder, 1,722 lbs. milk, 86.10 lbs. fat; Big A, 1,152, 59.90; Brown Jersey, 1,326, 57.02; Jap, 1,200, 54; Tony's Perfection, 870, 50.46.

R. H. Walrath, grades: Pansy, 1,359 lbs. milk, 57.08 lbs. fat; Minnie, 1,176, 54.10; Tilly, 1,164, 52.38.

Warne & Sons, Holsteins: Fayette Segis, 1,702 lbs. milk, 59.24 lbs. fat; Bessie Abbek. Col. II, 1,594, 51.16.

The influence of the advancing lactation of the cows and of less favorable feed conditions in many cases is seen in a somewhat smaller number of high records during the past month as compared with earlier months. One cow produced over 100 pounds butterfat during the month, viz., Kiatta Pontiac Pride, a four year old pure bred Holstein, owned by the Palo Alto Stock Farm (3,651.7 pounds milk, 100.06 pounds butterfat, average test, 2.74 per cent; distance from freshening at the beginning of the month, 31 days.).

One cow produced between 90 and 100 pounds butterfat during the month, eight produced between 80 and 90 pounds, and 38 between 70 and 80 pounds.

The California Cultivator prize for June was won by Nate Hauck of Alton for an average production by five grade Jerseys of 74.95 pounds butterfat (ranges, 62.7 to 91.8 pounds). These grades stood first among similar groups of cows in 27 different herds that competed for the Cultivator prize the past month. The average production of all but seven of these groups came above 50 pounds butterfat, the lowest producing grades averaging 27.98 pounds butterfat for the month. Grades in the herds owned by the following dairy farmers produced, on the average, over 50 pounds butterfat: N. Hauck, 74.95 pounds; W. Terkelson, 74.30; J. A. Genzoli, 71.69; M. L. Pontoni, 71.36; E. Graham, 69.69; L. Christen, 69.24; E. Biondini, 65.46; F. F. Pellissier, 62.13; P. Iversen, 61.92; W. F. Early, 61.66; H. L. Wakeham, 61.50; Los Angeles County Farm, 57.31; Arden Certified Dairy, 57.01; Giacomini and Pedrotti, 56.68; J. B. Harbers, 56.41; W. B. Gries, 54.48; Napa State Hospital, 54; and Adohr Stock Farms, 50.40. This is the third month in succession that the Cultivator prize has been won by a Humboldt County farmer. Since the competition started this prize has gone six times to Los Angeles County, three times to Humboldt County, and once to San Joaquin County.

POLAND CHINA SALE

In announcing sale of Poland Chinas Fred A. Clark of Capay Rancho, Orland, writes:

"The stock we are offering for sale needs no special recommendation as it is generally recognized that this herd is at least as good as any in the state. Special attention has been given to breeding to bring out the desirable features of the Big Type Poland China stock. The blood lines represented in this herd were founded on the best known to the breed. The young stock is sired by Yates Big Jones and Black Bob. Yates Big Jones is a grandson of F's Big Jones, the Iowa grand champion of 1919. On the dam's side he is a grandson of Longfellow Giantess and she is recognized as the largest sow of the breed. Black Bob is a grandson of Old Big Bob on his sire's side and a grandson of Big Bone Leader on his dam's side."

FAT HOG AUCTIONS

The California Farm Bureau Marketing Association auction dates for August are: Wasco, Saturday, August 6; Tulare, 9; Visalia, 10; Hanford, 11; Corcoran, 12; Turlock, 16; Merced, 17; Madera, 18; Fresno, 19; Bakersfield, 20; Tulare, 23; Visalia, 24; Hanford, 25; McFarland, 26.

California now has four cow testing associations on the 100 per cent pure bred bull list. These are: Santa Ana, San Diego. Sacramento-Yolo and Kings Counties.

Let the SUN give you plenty of HOT WATER

DAY & NIGHT

SEEMS impossible, doesn't it: But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home—mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept. E.

Save the roof
and help save the building

Winter rains and winds are coming! Protect your buildings where the weather strikes hardest—the roof!

ORONITE SHINGLE OIL
Preserves Shingles

Drenching rains and whipping winds cause moisture and air to penetrate the fibre of unprotected shingles and cause disintegration and decay. The hot sun causes evaporation of the natural oils in the shingle fibre and cracking and warping occur. These results of exposure hasten the day when you must stand the cost of repairs or an entire new roof.

Use
ORONITE SHINGLE OIL
on all shingles

Oronite Shingle Oil is a high-quality preservative especially prepared to protect shingles against exposure and the effect of the elements. It is used on side walls as well as on roofs. It penetrates the shingle fibre with a moisture-resisting preservative. It retards the evaporation of natural oils in the wood, prevents cracking and warping and gives longer life to the shingles.

Examine your shingle roofs *now*. Last winter was one of the heaviest in the experience of the Pacific Coast. Your shingles need attention. Put them in condition to stand up under next winter's weather. An application of Oronite Shingle Oil *now* will save your roof and help save your building.

Oronite Shingle Oil may be readily mixed with colors. Our nearest agent will be glad to give you formulas.

STANDARD OIL COMPANY
(California)

OTHER QUALITY PRODUCTS

especially prepared for use on the farm.

Oronite Roof Paint
A high-quality protective coating for prepared roofing and metal roofs.

Mica Axle Grease
Gives a durable, smooth lubricating film under every pulling condition. Keeps the axle cool; no hot boxes, no gumming. The MICA makes it better.

Eureka Harness Oil
Preserves the original strength and life of leather and keeps it soft and pliable. Keeps harness "new looking."

Standard Hand Separator Oil
Correct Lubrication for your Hand Separator, under the conditions of high speed and close fitting parts.

HOUSEHOLD QUERIES

(Continued from Page 132.)

the kitchen it would be fine but doubtless more comfortable if covered with linoleum. Nothing could be better for all the porches, though on the front porch a cheerier effect would be secured through liberal use of rugs. However, this is a question we will pass on to our subscribers and we will appreciate very much information from those who have tried concrete floors.

HINTS FROM HOUSEKEEPERS

Steam Pressure Cooker

A Stanislaus County subscriber recently called at the Cultivator office, told us she liked us and the paper in general and the household page in particular, but wouldn't we please boost the pressure cooker. She has one; several of her neighbors have them; several more are going to have them; and they are all double-dyed enthusiasts over the work saved, the time saved, the fuel saved, the heat and worry saved by the use of the steam pressure cooker. They use them for quick meals and, best of all, they say, for canning.

In compliance with our subscriber's suggestion we call attention to Mr. Cruess' article in this issue on canning meats and vegetables. Note in the tables he gives exact time required for canning each article under certain steam pressure. Note that he says of pressure cookers: "Use these if possible for vegetables and meats in preference to an open boiler." * * * "Pressure sterilizers only should be used for high altitudes for vegetables and meats."

Below we give two recipes which will show how time may be saved in preparing foods which require long slow cooking—according to old time ideas.

New England Boiled Dinner

Ready to serve after 10 to 15 minutes pressure, according to size of vegetables.

Put one-half cup of water and four or five slices of bacon in bottom of cooker, add one head of cabbage cut in eighths, four medium sized turnips, two or three carrots cut in two inch lengths, four onions and four medium sized potatoes. Season to taste. Cook at 20 pounds pressure 12 minutes. Open pet cock outside to keep odors out of house. Serve on large platter garnished with pickled beets. Save liquid for vegetable soup stock.

Chicken With Rice

Singe, draw and cut one fowl into neat joints; season with salt and pepper. In the cooker melt four tablespoonfuls of butter, add four tablespoonfuls of finely chopped onions, pieces of chicken, and fry with cover off cooker until lightly browned. Add one cupful each of hot stock or water and stewed tomatoes, one green pepper chopped, one-half teaspoon of salt and a little celery salt. Put cover on cooker and cook 30 minutes under 20 pounds pressure. Release steam carefully. Serve chicken in a border of hot boiled rice or barley, pour sauce over and garnish with parsley.

Watermelon Sweet Pickles

I am sending recipe for watermelon sweet pickles which I think excellent:

Peel the rind and cut up in squares or any desired shape, place in earthen jars and pour enough boiling vinegar over to cover, drain second and third day, let vinegar come to a boil and pour over again. On fourth day drain, throw away the vinegar. Weigh your fruit and to 5 pounds of watermelon rind use 3 pounds sugar and enough vinegar to cook fruit in. Add a few whole spice cloves and stick cinnamon, let cook until transparent, then put fruit in jars and boil syrup down until just enough to cover. Put away and they are ready for use.—Mrs. Geo. S. Hewett, Corning.

Stating it differently, the repressionist tries to control his passions, desires and appetites and makes these his servants. The expressionist conscientiously and consistently trains his passions, desires and appetites to control his own actions—and becomes the servant.—Kansas Industrialist.

Why Do Turkeys Die?

By Jean A. Koethen

WILL some turkey raiser kindly give me advice on the following," writes a Whittier subscriber. "I have lost many young turkeys between two and four weeks old. They eat well and seem well until about 24 hours before they die. In some cases there are slight indications of white diarrhea, never any other sign of illness. They have green range in favorable weather, have at all times absolutely clean, dry, disinfected quarters with abundance of fresh air, have never been out in the rain or dampness nor been infested with lice or mites. When shut in because of rain they have had ample room. Clean, fresh water was before them constantly, also grit, charcoal and sour milk. Their feed consisted of hard boiled eggs, young onions, wheat flakes and charcoal, all ground together and sprinkled over with fine grit. This was fed three times daily on clean boards. When crops began to feel full all food was removed. In an hour or two they had lettuce heads to tear up. Sometimes the 15 poults ate as many as five lettuce heads in a day. Dissection showed the intestines of the dead poults, including appendix, hard and bony and containing a little offensive whitish substance, the liver sometimes full of sores, sometimes normal, other organs normal. During the rains the floor of their house was kept covered with clean, dry barley straw, and I have many times drawn from their mouths long straws that they had partly swallowed. Could swallowing straws like these have caused the trouble?"

This complaint voices the perplexity of nearly every man and woman who ever tries to raise turkeys. These turkeys died as 19 out of 20 of the little turkeys that drop off the first two months die, in spite of the most exacting care and with very slight symptoms of illness. Sometimes they are well at night and gone in the morning. Sometimes they are droopy in the morning and we find their lifeless bodies before night. The older they are the longer they live, but as a rule those less than a month old go very quickly. Why? The question has not been finally nor fully answered.

What Is Blackhead?

This much we do know, that almost without exception our little turkeys are victims of the disease known as blackhead because of the darkening of the head in some but by no means all cases. This disease has been the scourge of the turkey tribe the country over, starting in the East and working gradually westward. At first it was believed to be contagious, but that theory seems to have been finally disproven. Dr. Philip Hadley of the Rhode Island station, who has done more careful and exhaustive work than any other scientist in investigating this disease, said in an article published last year: "The writer does not know of a carefully controlled experiment in which it has ever been conclusively demonstrated that blackhead has been produced in healthy flocks by the introduction of infected birds. During one year of experimental work in the field the writer made it a point of removing the ceca and livers of poults which died of blackhead, chopping them up in a meat cutter and feeding them en masse to other poults as a partial substitute for beef scrap. The mortality from blackhead in the fed group and in the control group was essentially the same. Most of the poults died after several weeks with gape worm infection and with no sign of pathologic changes in either ceca or liver. The writer would have no apprehension in feeding to "healthy" poults any reasonable amount of pathologic material from blackhead cases, provided it were done in such a way as not to upset the normal digestive equilibrium and not to introduce pathogenic bacteria nor bacterial toxins."

The blackhead germ, which bears the name Trichomonas, is found, Dr. Hadley says, in the intestinal contents of nearly all animals. Ordinarily it remains in the intestinal tract and does no harm. It is only when it invades the deeper tissues that it is deadly. The question scientists are trying to answer is what causes the germ to depart from its ordinary peaceful career and become the invader and devastator of liver and intestinal walls.

Diarrhea the Beginning

Diarrhea is always, or almost always, one of the first symptoms of blackhead. The question is are the germs (scientifically called flagellates) which are always found in great numbers in this diarrheal condition, the cause of the diarrhea, or are they its result? Dr. Hadley believes the diarrhea is the primary condition and the increase in number of parasites secondary. In other words, whatever causes diarrhea is likely to cause rapid multiplication of the blackhead parasite with consequent weakness and death.

Now we are getting so close we can almost put our finger on the cause of blackhead. What causes diarrhea in little turkeys? "Indigestion," say we all of us with one voice.

And what causes indigestion? Ah, there we have it. What causes indigestion in little children- Overeating; irregular eating; improper food; lack of sufficient food; chill. And these are exactly the causes of indigestion and diarrhea in poults.

An Evasive Parasite

Whenever we can fully determine just what feed and what amount of it can be fed and under what conditions without causing indigestion we shall have conquered the blackhead germ. The difficulty is that turkeys, like children, are not all alike in their powers of resistance. Some have stronger digestions than others and so we must keep searching for the

(Continued on Page 143.)

POULTRYMAN'S CALENDAR—AUGUST, THE VACATION MONTH

The poultryman never does get a real vacation. If he slips away from his cares for a few days he still keeps their crows and cackles in his ears and wonders whether Mother will remember to let out those broodies or Bob will paint the roosts after he cleans the droppingsboards. Two weeks with all his work behind him is impossible. How can he help reading the produce quotations or talking shop with the chicken farmers along his route of travel?

But it is seldom the poultryman can get two weeks off under any circumstances. The demands of the hennery are too exacting. Mother and the boys may do the feeding and cleaning, but will they notice which hens are beginning to drop feathers? Will they spot that slacker that loafs on the roost or remove the hen whose comb is wilting? And suppose they render perfect attendance to these exacting ladies, who is going vacationing with father? A lot of fun he has, leaving the folks home and going off by himself. You can take a baby along; you can even carry the goat on the running board; but hens do not go visiting. That is the dark side of poultry husbandry.

Produce Exchange closing prices: Eggs, cases included, fresh extras, 40; case count, 38; pullets, 35; pewee pullets, 24.

Extras last week and year ago:

July	28	29	30	Aug. 1	2	3
'21 ...	38	38	39	39	40	40

POULTRY

Price to producers: Hens, 18@28; colored, 33; broilers, 29@31; roasters, 33; old roosters, 12; fryers, 27; ducks, old, 12; ducklings, Pekin, 3½ up, 30; others, 25; geese, 25; turkeys, live, young tom, 50; dr., 55; old, live, 40; dr., 44; hens, live 40; dr., 44; squabs, 45@47.

Belgian hares, live, 11@14; old 8.

LIVESTOCK

Los Angeles, Aug. 2.—Weighed and delivered off cars without food or water: Hogs, hard grain fed, 125 to 175 lbs., 11.00; 175 to 225 lbs., 11.50.

Cattle (on foot, gross weight): Steers, good, 7.00; medium, 6.50; cows, good, 5.50; medium, 5.00; bulls and stags, 3.00@3.50; calves, 125 to 150 lbs., 9.00; 175 to 225 lbs., 8.50.

Sheep: Ewes, 5.00@5.50; lambs, 8.50@9.00.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock August 2, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Supplies liberal. Demand moderate, market firm. New stock: Wide range in prices, mostly 50@60 per lug, few best 65, poorer 40@45. No. 1, sacked per cwt. mostly 1.50@1.65, poorer 1.10@1.25, Bakers 2.00@2.25.

Onions: Supplies moderate, movement moderate, market steady. Stocktons: Australian Browns 90@1.00 sacked per cwt. Local: Whites 75@90, Browns 75@90 per lug.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock August 2 by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Beans: Supplies light. Demand moderate, market seady. Per lb.: Kentucky Wonders mostly 5@6 per lb. Jobbing: Mostly 4@5 per lb., poorer 3. Limas, Supplies moderate, movement slow, market weak, mostly 5½@6, poorer 4@5 per lb.

Beets: Supplies moderate, market steady. Per dozen bunches mostly 35@40.

Cabbage: Supplies light. Market steady. Per field crate 2.00@2.25, mostly 2.25.

Carrots: Supplies light, market strong. Per dozen bunches mostly 40.

Celery: Supplies liberal, market steady. Per crate 6.00, poorer 5.50.

Corn: Supplies liberal, movement slow, market weak. Local: Per lug, best mostly 60@70, poorer 40@45.

Cucumbers: Supplies liberal, movement slow, market weak. Local: Lugs mostly 45@50, poorer 35@40.

Eggplant: Supplies increasing, market steady, 7@8 per lb.

Lettuce: Supplies light, market steady, very little good stock. Local: Field crates mostly 90@1.00, poorer 75 per crate.

Peas: Supplies light, market firm, 10@12 per lb.

Peppers: Supplies heavy, market weaker. Locals: Bells mostly 10@15, fancy Chilis 7@8 per lb., few best 10.

Radishes: Supplies light, market firm, mostly 20 per dozen bunches.

Tomatoes: Supplies heavy. Demand and movement improving, market firm. Wide range in quality and condition, considerable ordinary. Local: Per lug mostly 1.10@1.25, No. 2, 50@75.

Turnips: Supply moderate. Market steady. Per dozen bunches 35@40.

FRESH FRUITS

Apples: New stock: Supplies liberal market weak, mostly 50@75, "B" Grade Gravensteins 2.65.

Cantaloupes: Supplies moderate. Demand and movement moderate, market weaker. Homegrowns, per crate mostly 2.00@2.25.

Casabas: Supplies liberal. Demand moderate, market steady, stock mostly ordinary 2@2½ per lb., few best 3 per lb., poorer low as 1½.

Figs: Supplies light. Demand and movement good, market steady. Locals: 20@25 per lb. Calimyrnas, large flats 2.25.

Grapes: Supplies liberal. Demand moderate, market weak. Wide range in quality. Per lb., Malagas, best 10, poorer 7@8 per lb., Thompson Seedless mostly 5@7, few fancy Persians 13.

Peaches: Supplies heavy. Market steady. Wide range in quality, considerable ordinary condition. Lugs, best Clings 75@90, poorer 50@60. Freestones, best 1.15@1.25, poorer 60@75.

Pears: Arrivals past 24 hours, 1 car calif Supplies liberal, market weak. Bartletts 5½@7 per lb. Other varieties 5@6 per lb.

Plums: Supplies moderate, market firm. Santa Rosas mostly 7@8 per lb. Prunes, sugar variety 4 lb., Satsuma plums 2@3 lb. Burbanks 1½@3 per lb., Wicksons 5.

Watermelons: Supplies liberal. Demand slow, market weak. Considerable ordinary condition, mostly 2@2½, few 3@3½, poorer 1½ per lb., fancy Klondikes, locals 4 per lb. Other varieties 3 per lb.

CITRUS FRUITS

Grapefruit: Suplies liberal, movement good, market firm. Local: Per box, market pack 2.50@3.00, special packed brands 3.25@3.75.

Lemons: Supplies moderate. Demand moderate, market weaker. Local: Packed box mostly 6.00@7.00, loose per box, 3.00@3.50.

Oranges: Supplies moderate. Demand active, market stronger. Valencias, best brands, all sizes 5.00@5.50, ordinary, 2.50@3.50, loose pack 1.00@1.50.

HONEY

As reported by the Bureau of Markets:
Los Angeles: Supplies of White Sage, White Orange and Light Alfalfa, heavy. Light wire inquiry. Movement very slow, market steady, little change in prices. Carloads f. o. b. usual terms at loading points: White Orange new crop 12@12½; old crop 10@11; Light Amber Alfalfa old crop 5@6, new crop 5½@6½; White Sage 12@12½. Hawaiian, no sales reported. Beeswax: Market weak, very light demand. Dealers asking 30@33 for light and 24@26 for dark. Estimate of crop unchanged from last report. Sage and Orange crop very uneven, some places normal, others practically none. Exchange expects stronger market but other brokers expect weak and dull market.

GRAIN AND FEEDS

Grain Exch. price bid August 2:
Corn: Bulk No. 2, Yellow 1.57½; No. 1, White, 1.61¼.
Milo: Eastern No. 2 bulk, 1.80; No. 3, 1.70.
Bran: Kansas, 25.50.
Barley: Carloads, 1.23¾.

HAY

Alfalfa Growers of California report:
The market for alfalfa hay developed a better undertone in the course of the week. A number of districts report stronger local demand. In the Yuma section cutting of alfalfa has come to an end for the season, practically the entire acreage being used for the production of seed; in the Hemet and a number of other districts a considerable acreage is being used in this way, which was not the case in former years. A very striking feature in the market reports from all over the country east of the Rockies and also from Europe is that all refer to the very damaging effect of the long dry and hot spell on pasture and the production of hay. One of the results has been a sharp advance in the price of bran in the East, which probably will lessen or stop the Kansas shipments of it to this state. In Wisconsin the price of hay advanced $5 to $6 a ton last week, after the publication of the state crop report on hay, which showed a reduction of a million tons.

There is a continued active and increasing demand from the orange growing districts for damaged and low grade alfalfa hay for fertilizer at about $14 per ton delivered at groves, and several round lots were sold at this price during the week. It is claimed that compared with the price of stable manure, alfalfa has a fertilizer value of about $20 a ton. There were 1,030 tons received on the Los Angeles tracks the week ending July 30, with 390 tons held over.

Prevailing prices last week f. o. b. Los Angeles:

No. 1 Dairy	19.00
Standard Alfalfa	15.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	18.00@26.00
Barley	16.00@24.00
Alfalfa, No. 1 Dairy	20.00
Standard	16.00
Straw	8.00

CORN HARVESTER Self Gathering for cutting Corn, Cane and Kaffir Corn. Cuts and throws in piles on harvester. Man and horse cuts and shocks equal to a Corn Binder. Sold in every state. Price only $28 with fodder binder. The only self gathering corn harvester on the market, that is giving universal satisfaction.—Dexter L. Woodward, Sandy Creek, N. Y., writes; "3 years ago I purchased a Corn Harvester. Would not take 4 times the price of the machine if I could not get another one." Clarence F. Huggins, Spearmore, Okla., "Works 5 times better than I expected. Saved $40 dollars in labor this fall." Roy Apple, Farmersville, Ohio., "I have used a corn shocker, corn binder and 2 rowed machines, but your machine beats them all and takes less twine of any machine I have ever used." John F. Haag, Mayfield, Oklahoma., "Your harvester gave good satisfaction while using filling our Silo." K. F. Ruegnitz, Otis, Colo., "Just received a letter from my father saying he received the corn binder and he is cutting corn and cane now. Says it works fine and that I can sell lots of them next year." Write for free catalog showing picture of harvestor at work and testimonials.

WHY DO TURKEYS DIE?

(Continued from Page 141.)

happy mean in feeding which will not overfeed one while it starves another.

At the Rhode Island station it was thought at one time that letting the little birds eat two or three minutes and no more solved the problem. We know now that it is quite as easy to underfeed as to overfeed. When we say "Keep them hungry" we do not mean "Starve them." There is a difference.

It seems quite evident that amount of food is more important than kind. Rolled oats, hard boiled egg, stale bread, cottage cheese, clabbered milk, onions and other greens are all good. One breeder uses nothing but johnny-cake and egg and greens the first two months. Another feeds egg, bread and greens. Another uses no egg, but cottage cheese. And they all have about the same success. Sometimes their poults die and sometimes they live.

One breeder I visited this spring believes that warmth is more important than feed. He cuts the ration in two, he says, if the turkeys come in to supper chilly. Another says his poults do much better in a brooder than with either a turkey or chicken mother because the hens do not keep them warm enough in the early morning.

Ipecac a Preventive

The preventive treatment announced this spring by Drs. H. M. and Paul Wegeforth of San Diego has attracted much attention and may prove the ultimate solution of this vexed problem. They have discovered after considerable experimentation on their ranch at National City that fluid extract of ipecac, which has been found a valuable remedy in human enteritis, prevents the development of the blackhead parasite. The sick birds are given 10 drops three times a day for three days, then 10 drops twice a day for three days, then 10 drops once a day for three days. By this time they are ready to be returned to the flock.

To prevent the disease in little turkeys powdered ipecac is fed in the food, one teaspoon twice a week being the dosage for 20 poults, without regard to size. Over 100 birds hatched this season in one hatch were reared without a single case of blackhead under this treatment, while a nearby breeder lost 320 out of 400 hatched.

It is unfortunate if we must resort to dosing to prevent this devastating disease, but dosing is better than loss. In time we shall no doubt learn to conquer it by natural means, for the turkey is too great a gift to civilization to be utterly lost, but till we have found the better way, let us use ipecac.

Poultry Queries

(Conducted by Jean A. Koethen)

Black Orpingtons Wanted

Will you please tell me where I can buy some Black Orpington chicks?—Subscriber, Campo.

If any Cultivator reader has stock of this variety he would do well to make it known. The advertising columns of the paper are searched every week by prospective purchasers of good stock.

Caponizing

Will you inform me where I can get lessons in caponizing, and which is the best market for capons, Los Angeles or San Francisco. — Subscriber, Oak Knoll.

I have mailed you the address of a party who I understand gives instructions in caponizing. There is a good market for capons in both Los Angeles and San Francisco without marked difference in prices.

LET'S PULL TOGETHER

(Continued from Page 123.)

$8.80, that is paid by a Ford runabout, a 22 passenger White bus pays the same license fee that a Studebaker five passenger touring car pays, $11.60, and a four ton Moreland solid tired truck pays $29.40 as against an average fee for the same capacity truck for the entire United States of $45.50. The average license fee paid per car in California is $1.32 less than the average for the United States, yet we give more highway service than most other states.

"The clubs claim to have saved the automobile and truck owners $11,000,000 during the next two years, but if they have saved these owners, they have deprived the highways of that sum. Whatever improvement is now necessary has been occasioned almost entirely through use of our highways by the motor vehicles of the persons who would have met the increased tax. All the people of California are providing the funds for original construction and it is only right that those who now make use of highways for business or pleasure should pro-rate the cost of such maintenance, reconstruction and improvement as is made necessary by such use."

Breakfast Breads

THAT ENLIVEN THE MORNING MEAL

MUFFINS, waffles, popovers, griddle cakes, piping hot biscuits—how they enliven the morning meal! Experience has shown that the most simple and efficient way of putting a batter together is to mix and sift the dry ingredients first, then mix the liquid and the well-beaten yolks of eggs, and combine mixtures. If using shortening add melted, and at the last fold in the stiffly-beaten whites of eggs.

Eggs should always be beaten separately when lightness is desired, but if time is limited it will be all right to beat the eggs together.

For waffles the iron should be well heated and brushed on both sides with melted shortening. For griddle cakes the griddle should be heated, and if not soapstone or aluminum, greased. Drop batter by spoonfuls and, when puffed and full of bubbles and cooked on the edges, it should be turned and browned on the other side. Never turn griddle cakes but once, otherwise they will be heavy. Have muffin pans hot and greased well.

Heavy pans will give much better results than tin. Fill the pans only two-thirds full, and if any are left unfilled they should be filled with water to prevent burning. Muffins and corn breads need a moderately quick oven and should bake about twenty-five minutes.

To determine the heat of the oven, an oven thermometer will be found most convenient, and will prove a preventive of many failures. Or, try this: Place a piece of white paper in the heated oven and close the door. If in three minutes the paper turns a golden brown the oven is moderately hot.

BELLE DE GRAF
Director Sperry. Domestic Science Dept., who stands sponsor for the following Sperry Standard Recipes:

Sperry Muffins

2 cups Sperry Drifted Snow Flour, 4 teaspoons of baking powder, 1 teaspoon salt, 2 tablespoons sugar, 1 egg, beaten, 1 cup milk, 2 tablespoons shortening.

Sift dry ingredients; beat egg well; add milk and dry materials, gradually beating to a smooth batter; add melted shortening last. Bake in heated, well greased muffin pans in a hot oven.

Sperry Drifted Snow Waffles

1 cup Sperry Drifted Snow Flour, 2 teaspoons baking powder, ½ teaspoon salt, 1 egg, 1 cup milk, 1 tablespoon melted butter.

Mix and sift the dry ingredients; beat yolks of eggs, add milk and combine mixtures. Add shortening, fold in the stiffly beaten whites of eggs. Bake at once on a greased, hot waffle iron.

Sperry Popovers

1 cup milk, 1 cup Sperry Drifted Snow Flour, ½ teaspoon salt, 2 eggs, 1 teaspoon melted butter.

Add Sperry Drifted Snow Flour and salt to milk and beat well with an egg beater. Then add one unbeaten egg at a time, beating thoroughly. Add melted shortening. Have iron muffin pans or custard cups very hot, grease well, pour in popover batter and bake in a medium hot oven about forty minutes.

Value of Livestock Shows Great Increase in Decade

THE number of California farms increased from 88,197 in 1910, to 117,670 in 1920. This has meant also material increase in the wealth of the state as is shown by the fourteenth census figures of crop production and number and value of domestic animals.

There were in the state on April 15, 1900, domestic animals to the value of $65,000,738. On April 15, 1910 their value had increased 89.3 per cent, or to $123,024,652. In the fourteenth census, or that for 1920, the time of report was changed from April 15, as in former years, to January 1. Since a great many domestic animals are born in the period between January 1 and April 15 comparison is not absolutely accurate. However, notwithstanding this handicap, California showed an increase in value of stock, from April 15, 1910 to January 1, 1920, of 66 per cent and now reports domestic animals to the farm value of $204,378,445.

The value of the annual production of the livestock industry likewise shows great increase. The value of dairy products of the entire state is given as $55,642,649. Counties producing above a million dollars are: Alameda, $1,473,896; Humboldt, $4,381,-129; Imperial, $2,315,489; Kings, $1,968,883; Los Angeles, $4,912,896; Marin, $2,665,016; Merced, $3,842,-243; Monterey, $1,817,210; Sacramento, $1,218,237; San Joaquin, $2,340,938; San Luis Obispo, $1,084,-282; Santa Clara, $1,536,935; Sonoma, $2,145,704; Stanislaus, $4,773,562; Tulare, $2,564.745.

Under dairy products the bureau considers farm value of the milk or cream as sold to distributor or to creameryman, that is, excepting in the case of butter and cheese actually made on the farm. The creamery and cheese factory products are not taken into account.

There is no report as yet given as to number of animals slaughtered or value of meat products.

The number of horses on farms totalled on January 1st, 402,407, valued at $35,416,507; mules, 63,419 valued at $7,221,930; asses and burros, 2,265, $171,-175; beef cattle, 1,229,086, $61,280,293; dairy cattle, 778,951, $59,401,153; sheep, 2,400,151, $25,906,445; goats, 115,759, $1,130,035; swine, 909,272, $13,850,907.

California's wool production for the year 1919 amounted in value to $5,762,356, while mohair was valued at $110,160.

The value of chickens and eggs produced the year preceding January 1, 1920 was $34,727,935. Sonoma County produced more than one-third of this amount. There were only four counties in the million dollar class in annual poultry production: Alameda, $1,260,047; Los Angeles, $4,624,789; San Diego, $1,373,837; Sonoma, $12,380,034.

The value of all poultry maintained on the farms of the state, however, is $15,293,570.

The value of honey and wax produced in California in the 12 months was $1,141,999. The total value of the colonies of bees was $1,469,447.

Livestock in United States

The average value of horses per head in 1920 in the entire United States was $90.13, as compared with $105.06 in 1910; the average for mules was $142.88 in 1920 and $124.80 in 1910; of cattle, $54.40 and $24.26 respectively; of sheep, $11.30 and $4.44; and of swine, $16.66 in 1920, as against $6.86 in 1910. It thus appears that while the average value per head of the several kinds of meat animals (cattle, sheep and hogs) more than doubled between 1910 and 1920, the case was quite different with draft animals, horses showing a decrease in average value and mules only a moderate increase.

The production of chicken eggs on farms in the United States in 1919 was 1,656,267,200 dozen as compared with 1,574,979,416 dozen in 1909, representing an increase of 81,287,784 dozen, or 5.2 per cent. The figures for eggs produced and chickens raised in 1919 and 1909 afford a fair basis for—(Continued on Page 159.)

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

An Eastern tire manufacturer is offering university scholarships for the best essays written on the subject of good roads and highway transport. This is open to high school pupils of the United States. Judges are appointed from the department of engineering, University of Maryland, from the department of commerce and from various highway associations. It is asserted these essays are creating material interest in better roads and more of them. The products of the farm go to market cheaper, in better condition and command more money over good roads than over chuck holes and ruts.

* * *

The war finance corporation announces that advances of funds already made and under contemplation total $63,471,000. Ninety-three per cent of this total covers agricultural commodities, and by far the greater proportion of this 93 per cent has been advanced on cotton, which is the nation's greatest export commodity. In addition to these advances the corporation has agreed to advance $8,500,000 to banking institutions on shipments of condensed milk; other advances or loans to be made on meat products, agricultural implements and other productions and manufactures.

* * *

"Hide and Leather," a magazine devoted to the interests of leather manufacturers, refers to "the recent effort—fortunately defeated—to put hides and skins on the dutiable list of the new tariff bill * * * alleged to have been dictated by farmers," and adds, "It was a clumsy effort and deservedly failed." Then follows a long article calling attention of the livestock man to the necessity for giving greater attention to "a certain fly which lays its eggs on the feet of cattle, etc.," and urging greater care in eradicating this pest. In other words, stop the warble fly from its attacks on animals and your cattle will have greater comfort, and we, the people who make leather will have greater profit. Of course, the idea is to divert attention from the real issue which is ruining the producer and fattening the manufacturer. So long as South American dry hides are flooded into this country at ruinous prices there is no show for American produced hides. We hope American livestock people will produce a higher quality which naturally commands a higher price, but it is maddening to have manufacturers stall off an effort to save a desperately discouraged industry.

* * *

The U. S. consul at Liverpool, England, reports: "The quality of the apples which arrived on the market has been good and the fruit inspection, both in the United States and Canada, has done much to place this trade on a more satisfactory basis." Thank you. California is doing some standardizing and shipping point inspection which makes such little compliments appreciated.

* * *

The almond growers are doing some mighty fine work before the ways and means committee. In fact, the entire agricultural committee of Californians in Washington is working to a purpose, but the almond people seemed to start under a greater handicap than some of the others. It is still sticking for 5 and 15 cent tariff protection.

* * *

Speaking of the tariff, there's the tariff on eggs, at which all east of the Rocky Mountains hold up their hands in horror because they seem to think that this country imports no eggs. If those people could be permitted to observe some of the imports through Pacific ports they would see literally thousands of carloads of eggs in various forms coming into this country from the Orient. Many are "fresh"; some are frozen; some are dried; all are of inferior qaulity; but they fill the market and supply bakers and other trades and lessen the demand for American produced food. It costs vastly less to transport these eggs from producing sections of the Orient than it does from producing sections of California to the larger Eastern consuming sections. As to producing costs over there—well, what American wants to work and compete with Chinese and Japanese?

* * *

In transportation of eggs a few experiments are being made. A few weeks ago a large steamship sailing from San Francisco to London carried a sample shipment of 50 cases of "processed" eggs. The shipment was made to test the question of whether the processing treatment will prevent eggs from absorbing odor or flavor from other products shipped in the same compartment. It costs two cents per dozen less to ship an egg from San Francisco or Los Angeles to London than it does by railroad to New York. The rate to London is five cents; to New York, seven cents.

READY FOR FAIRS

Specialists are processing fruits; the housekeepers are jamming, preserving and jellying; machinery and implement people are dusting, painting and even nickel plating; livestock breeders are grooming and training; and all agriculture is doing its prettiest to make holidays in various producing centers. We already have in hand a story of some of the things to be witnessed and heard at the state fair which will be held in Sacramento September 3 to 11. This story will be given in an issue of the Cultivator before the fair. Meantime in another column may be seen box with dates of various fairs all over California, Arizona, Washington, Oregon and other sections of the coast.

While there is much in these shows which may prove spectacular rather than educational, the general effect is for the good of agriculture. The one who receives greatest benefit is the exhibitor, for he learns the good points of his own productions. He also submits to what is sometimes merciless criticism, but he comes back another year with beneficial results from that criticism. There is no judge whose decisions are without fault, but in the main they are just, and as the decisions are rendered often with explanation of reasons for the decisions there is a wonderful lesson in them, especially for the loser.

There is sometimes complaint that agriculture is not helped as much as it would be if averages were shown rather than exceptional examples, but while an exhibit made at fairs may not be the true measure of the agriculture of a state, it is a true measure of the aspiration of the producers and therein we are all inspired to do better. For four months now fairs will be on the boards. Take advantage of them.

LEARN THE GAME

It's funny; more correctly, it's tragic, for so many people to come to California with the idea that here is the realization of their dream of "two acres and independence." The school teacher, the doctor or the banker is tired of the calling that has given him bread and butter for many years and so a California farm is desired. They come to the office of the California Cultivator and say: "I have spent my life at teaching in Connecticut; by hardest saving have arrived in California with five or six thousand dollars." (Sometimes it is only a hundred or two.) Following this statement is to be expected this question: "Where can I buy land with this money with which I may be assured of a comfortable living for myself and family for the rest of our lives?"

To the California farmer, or the Easterner who came to California a few years ago under circumstances similar to those of the inquirer, the tragic part of the story is easily imagined. To the enthusiastic reader of magazine articles and some of the books written to show how easily farming success may be achieved, we who have tried the game may sometimes appear cruel in the replies we are compelled to give to these people who know absolutely nothing of the highly specialized work they propose to take up. It is simply astounding to note the complete ignorance as to farming practice of many of these back-to-the farmers. We grant there have been cases of complete success by those who were professional people, but these successes are so rare that they should be warnings to would-be farmers. Such people should take the advice of the Colorado agricultural college which was given to a beekeeper. It was quite extended, but here is the gist of it:

"To acquire skill in manipulating bees and to learn the proper management so as to obtain maximum results, the best method is to spend a season in the apiary of an experienced beekeeper. If one contemplates making beekeeping an occupation this is to be especially desired. It is usually possible to find employment at a small wage in the apiary of a specialist for a season."

MORE AND BETTER ROADS

California producers want better roads. They have profited in quality of product and hence in greater return financially because of the roads already built. They are not patient with any campaign which may defer completion of the great system involving the expenditure of some $73,000,000 already voted and the construction of 5,500 miles of paved highway. Of this amount there have already been built approximately 3,250 miles, of which 1,800 are paved, about 700 graded, and 750 taken over from various counties have been improved under direction of the state highway commission. Practically all of these have been farm to market roads, serviceable, money saving roads. We want access to the mountains; we want scenic roads; but first we want service and economy.

The producers would like the ideal highway, the ultimate, or perfect, road, but competent engineers assert that in addition to the $73,000,000 already voted, such a system of highways would cost at least $150,000,000. Automobile club members may be able to build such a system of highways for California; the farmers are not.

In any case let's not do politics. Here is an estimate of the present effort by the editor of "Engineering and Contracting" of Chicago, in its issue of July 6:

"The automobile clubs of California continue their attacks against the California Highway Commission, in spite of the fact that their criticisms of the design of the state road were refuted by the report of the United States bureau of public roads. It would appear to a disinterested spectator that the automobile clubs are aiming at securing a new highway commission that will be subservient to their wishes. If this is brought about it will be a sorry day for California. Hitherto the highway commission has not been subservient to any class of people nor to any section of the state. It has been entirely free from political influences and it should remain free."

Notice has been served on strawberry growers on a large tract near Hayward, Alameda County, to plow fields and destroy all berry plants by October 1, to help exterminate the only strawberry weevil found in the state.

California Cultivator

Vol. LVII, No. 7 | Los Angeles, August 13, 1921 | One Dollar Yearly

Making Quality Raisins

By Fred K. Howard

IN a previous issue of the Cultivator it was pointed out that to make quality raisins the grapes must be well grown. The other side of the story is that no matter how well grown they may be, if not properly cured, much of the possible quality is lost.

Must Contain Maximum of Sugar

When one speaks of quality in raisins the first factor which presents itself is the sugar content. Sugar is in reality the very foundation of quality. Without sugar the raisin can be considered little more than a dried grape. The reason that certain varieties are designated as raisin grapes is that these carry a larger proportion of solid matter and sugar than the so-called wine and table varieties. Within certain limits the longer grapes are left on the vines the greater will be the sugar content. The grower must know when this point is reached, when his fruit ceases to acquire added quality and begins to break down. Exhaustive tests indicate that when the average sample of grapes in the vineyard will test 24 per cent sugar the maximum of quality, commercially speaking, has been attained. At 24 per cent sugar the grape will, if it is properly handled, make a raisin of good flavor that will be meaty and carry sufficient moisture to keep it in pliable or plastic condition for a considerable time.

Saccharometer Should Be Used

One of the most useful instruments for the vineyardist is the Balling saccharometer which can be used to test the fruit before picking time. This instrument is used officially to test samples of grapes under the California standardization law to determine maturity and has proven to be of great value to the raisin grower also. The grapes are tested by placing some of the juice in a cylinder and floating the saccharometer. The figure on the spindle showing at the surface of the liquid indicates the percentage of sugar in the juice or the sugar content of the grape. Many large growers own these instruments and as they are not expensive every grape grower should have one as a part of his necessary ranch equipment.

Use Care in Picking

After the fruit has reached the proper degree of ripeness the question of picking is considered. This operation is usually left too much to the whim of the picker, and often the quality is reduced very materially by careless work. Incidentally clean trays

Well Grown Bunch of Thompson Grapes
If allowed to ripen properly will make raisins which will be a delight both to the grower and consumer.

are very important. If the trays were not cleaned in some way after the crop was harvested last fall they should by all means be washed before using. Very often a broken berry will so contaminate the wood of the tray that it becomes an infection spot for the various moulds which attack the partially dried fruit, particularly if the season should chance to be a rainy one. Prevention in this case is much more certain than attempted cure.

Encourage the pickers to place each bunch of grapes on the tray in the proper place after picking. The usual method of throwing the fruit in a pile in the center of the tray until the desired amount has been picked, and then going after the fruit with both hands, after the manner of a woman at a bargain counter, is bound to break or bruise a large percentage of the berries. This means that not only the quality is lowered but a few more infection points for mould are provided. Mouldy raisins never will be the favored fruit of the consumer.

What Kind of Trays?

The question of trays is often discussed, and each kind, paper and wood, has its enthusiastic supporters. This is true if it doesn't rain. After a good storm the wooden tray usually has all the votes. For Thompson Seedless it is probable that the paper tray is very satisfactory except in districts of doubtful drying conditions. Once wet, the paper tray is hard to handle, in fact, it is almost impossible to so handle partially cured fruit that it can be protected from unseasonable rains. The later ripening varieties should always be dried on wooden trays if it is the desire to eliminate most of the gamble from the undertaking.

How to Dry

There is little to tell about and everything in the technique of properly curing raisins. It is impossible to lay down any rules which will hold good under all conditions. One season Thompsons may require five days in the sun before turning, and at other times they may require twice that much time. This is something which must be left entirely to the judgment of the vineyardist who automatically becomes a weather man and a chemist. The usual practice is to tilt the trays slightly to get the rays of the sun more directly on the fruit. In some cases growers feel that they are amply repaid for the extra time of turning the trays end for end after they have been in the sun for a few days. This operation insures direct exposure from at least two angles. Generally speaking the grapes should no longer have the appearance of green on the exposed side when they are turned, and they need not remain long in the sun after turning but may be stacked and allowed to finish curing in this manner.

The Purpose of the Sweat Box

The best cured raisins will not be uniform in moisture content, even with the greatest care on the part of the grower. Some of the bunches will be bone dry while other bunches will be much too wet to keep well. The purpose of the sweat box is to equalize the moisture content of the raisins it contains. This is not quickly done and is in reality a very essential process in curing a quality crop. When boxing the fruit should not be crushed into the box or walked on with the feet in an effort to crowd so many raisins into one box that it will take the place of two. It should, however, be firmly packed into the box and allowed to go through the sweating process. The trick of curing raisins is in not letting them get too dry and in getting them just dry enough. The trick is much more easily performed if the fruit carries the maximum amount of sugar, and after all the sugar question is perhaps the most important.

In a future issue of the Cultivator we will discuss the making of hand sorted layers, soda and oil dipping, sulphur bleaching and dehydration of raisins.

California's Biggest Pear Day

By Ernest Braunton

THE Antelope Valley residents are the only people in the state who seem to have 'pep' enough to stage a pear day," said Frank T. Swett, president of the California Pear Growers Association. "I think I shall have to suggest such a day to other sections. Of course you have the best pears in the world. I hear a similar claim when I go up to far away Lake County, and it is echoed when I get back home to Contra Costa County. We all have the best."

August 6, 1921, certainly was the state's biggest pear day, for nearly 1,000 gathered at Little Rock in the Antelope Valley to eat pear pie, ice cream, etc., listen to the valley's best boosters and visit the truly wondrous pear orchards, in one of the best of which the meeting was held, though the building was the district association's packing house.

The forenoon was spent in friendly visiting, culminating in a splendid free lunch supplied by the Antelope Valley Fruit Growers Association. The "piece de resistance" was pear pie, and plenty of it. The guest of honor was Amason Martin, "83 years young," the pioneer grower of the valley, who through many discouragements pointed the way and finally landed, with all who came after, in the present day prosperity of this famous pear growing district.

F. W. Lancaster was chairman of the day, and he is some booster. To hear him tell it the home of Opportunity lies in the Antelope Valley. After his ammunition gave out he introduced Farm Advisor Hodgson, who gave a geological history of the valley, seeking to prove that nature and the elements have been making soil ready for the pear grower for many thousands of years. "The altitude, heat, atmospheric humidity and other factors have conspired to make this valley second to none in the world for the production of pears. One marked feature of the local pears is their comparative seedlessness, for there is no cross pollination and here none is needed. The cost of good pear land here is $300 per acre; establishing an orchard, $86; cost of care to first crop, $34. In the state at large the land costs $600 per acre and the cost of establishing is much greater so that at maturity the figures run close to $1,000 an acre. The average production here is also better than the state's average."

The next speaker was President Swett, who told of the great advertising campaign waged in the East, for which the grower contributes five cents per box on his fruit. He showed some of the "ads" appearing in journals of international reputation and circulation, also some of the banners and posters on California pears supplied free to Eastern dealers. He stated that last year's pear crop for Lake County was 5,000 tons, the same for Contra Costa County, while the Antelope Valley, the infant district of the state, sent out 3,000 tons and was gaining in production more than any of them. "California's normal crop is 120,000 tons, but late frosts and rains cut down that figure for 1921 quite heavily."

Next spoke Wm. A. Brinck, district manager of the California Fruit Growers Exchange, who told funny stories and then got down to solid facts as to production and marketing, in considerable detail. He gave a report on the yield of all deciduous fruits for the present year, the financial condition of this and other countries as it affected fruit prices, and quite a mass of statistics relating to the industry. The program ended with reading, by the chairman, of a poem by Wm. C. Pechner, "the poet of the valley and its best booster." A Hawaiian orchestra kept up a steady "strum-strum" until the guests all had entered their automobiles.

Agricultural News Notes of the Pacific Coast

Northern California

Hop growers are making contracts at 12 to 13 cents.

The Butte County farm bureau reports 576 members.

Colusa County prune growers have organized an association.

The poultrymen of Hayward, Alameda County, organized July 29.

Oroville, Butte County, reports local rice fields ripening crops unusually early.

The 1921 acreage of rice in Butte County is 12 per cent less than that of last year.

An exchange at Livermore, Alameda County, reports offers of $100 a ton for wine grapes.

A stubblefield fire burned over 50,000 acres in the Livermore Valley during the last week of July.

Dr. H. P. Bonnikson of Durham has been appointed field veterinarian in Sutter, Yuba and Butte Counties.

Apricot crop in Winters district of Yolo County is 20 per cent short this year owing to early frost damage.

Sacramento Valley peaches brought as high as $4.75 a box in eastern markets during the last week of July.

A new fruit dryer has been established at Newcastle, Placer County, in the Silva-Bergtholdt warehouse.

The Lodi, San Joaquin County, canneries started packing peaches last week, paying $30 to $35 a ton for them.

Almond harvesting at Arbuckle, Colusa County, began August 1, the earliest picking in that section of the state.

At the end of the 38th week in the Petaluma laying contest, hen No. 348, property of C. H. Purvine, had laid 213 eggs.

Farm Adviser Baade of Napa County reports sale of the entire plum crop of the county to the Cooperative Cannery at San Jose.

The Colusa County Prune Growers Association met July 23 and set 40 cents an hour, without board, as the price of common labor at packing houses.

The Livermore Valley, Alameda County harvested 17,000 tons of hay, about 60 per cent of a normal crop. 200,000 sacks of barley was the yield of 18,000 acres.

D. R. McGregor of Woodland, Yolo County, has developed a new rice which ripens 40 days earlier than standard varieties used there. It has been named Eureka.

El Dorado County complains it is overrun with bobcats, foxes and coyotes, that come to the ranches in droves in daylight. Turkeys and goat kids are special prey.

The management of the Eden Township Farm Products Show says that so much space has been taken for agricultural exhibits that many concessions will be crowded out.

As a part of the cleanup campaign inaugurated by G. H. Flournoy of Tehama County, the desert pest known as the puncture vine has almost been completely eradicated in the region of Red Bluff. Large infestations of star and milk thistle are giving concern and Commissioner Flournoy has issued a timely note calling attention to the danger of fall seed infestation of ranches and ranges now considered clean.

Central California

The Patterson, Stanislaus County fair will be held August 24-27.

Peach shipments from Terra Bella, Tulare County, started July 22.

Oakdale, Stanislaus County, has just been given an additional rural route.

Watsonville, Santa Cruz County, is to have a large lettuce packing house.

Inyo is preparing for a real county fair October 4-5. It will be held at Bishop.

Construction work has begun on 20 miles of state highway through Bishop, Inyo County.

The Jersey calf club of Stanislaus County will exhibit at the Patterson fair, August 24-27.

Stanislaus County canneries are paying cutters 40 cents instead of 57 cents an hour, as last season.

O. G. Brundage of Farmersville, Tulare County, says that he expects to ship east 1,500 tons of fresh Calimyrna figs.

Black aphis badly infesting bean fields of Stanislaus County were easily controlled by a ten per cent nico-dust spray.

Monterey County is sending out an unusually large crop of wild huckleberries, especially from the Big Basin section.

A silver loving cup will be given to the winner of the Stanislaus calf club contest at the fair held at Patterson, August 24-27.

The demand for cantaloupes at Turlock, Stanislaus County, now exceeds the supply for the first time in the life of the industry.

Terra Bella growers have sold their Tuscan clings at $38 per ton f. o. b. Armona; Phillips clings at $35 per ton f. o. b. Porterville.

A Turlock, Stanislaus County, rancher has sent a 76 pound watermelon to President Harding. It was an Excel, measuring 30 inches long.

Hog auction sales will be held in Kern County at Bakersfield, August 20; McFarland, 26; Wasco, September 3; Bakersfield, 17; McFarland, 30.

Officers of the Holstein calf club of Stanislaus County are William Stammerjohan, president; Leslie Dixson, vice-president; Wilhelmina Fox, secretary.

Plant No. 25 of the Associated Raisin Company, which recently burned down at Fresno, will not be rebuilt, according to Wylie M. Giffen, president.

County Agent Jungerman of Stanislaus reports Blenheim apricots long pruned yielded 57 per cent over the short pruned, and Tilton apricots increased 65 per cent.

The state department of agriculture has prevented the shipment of some Gravenstein apples from the Pajaro Valley on account of too much "russet" on their faces.

The California Peach and Fig Growers Association is fitting up a building at Turlock with canning machinery. It is expected to be ready to receive fruit by August 20.

Following the initial appearance of mealybug in Madera, and the commissioners' conference in Fresno, the recommendation calling for the sterilizing of picking boxes will be vigorously enforced.

Southern California

The Imperial Valley, like Fresno, is shipping fresh figs to eastern markets.

The Downey Community Fair, Los Angeles County, will be held August 25-27.

The Imperial Valley has closed grape shipments with a total of 160 carloads.

Orange County shipped 132 cars of oranges during the first week in August.

The Valley Center farm bureau of San Diego County held basket picnic at Lilac, July 26.

Hemet, Riverside County, will hold a big carnival, termed a "stampede," on September 5-6.

Prominent citizens of Oxnard are planning to build a combination creamery and ice plant.

Imperial Valley hogs sold at 12 cents during the first week in August, the year's record price.

District No. 5, near Brawley, Imperial County, reports a heavy acreage and heavy crop of milo.

The big sugar factory at Oxnard, Ventura County, started operations on July 30, to run 100 or more days.

The Citrus Heights Development Company of Ventura County has just completed drying 225 tons of apricots.

Imperial Valley shipped 1,550 cars of watermelons during the season just closed. Last year the total was 1,231.

Orange County has 9,000 acres of Lima beans and 11,000 acres of Blackeyes. Limas are now being harvested.

The grape growers of the Palo Verde Valley have organized under the protecting wing of the Riverside County farm bureau.

The Irvine section of Orange County reports a heavy crop of Blackeye beans, the whole county planting 250 per cent over normal.

Hundreds of people attended the barbecue given last Saturday by the prosperous new town of Marion in the San Fernando Valley.

Canneries in the Yucaipa Valley, San Bernardino County, are beginning on pears. The price paid is $70 a ton, $20 less than the 1920 price.

Cutters at the Banning Cannery struck for 15 cents per box. Growers offered 12½ and secured other help. Strikers are returning at offered wage.

The Riverside Cannery of the California Growers Association started its season's run on peaches July 27. Manager Toon says the run will continue till October 15.

P. V. Stump of Hawthorne, Orange County, has invented a walnut picker that will pick up from one to six nuts at a time. Walnut officials are investigating its use.

The Blythe farm center of Riverside County is asking for an emergency rate on hay of $5 a ton for shipments out of the valley for the next 90 days. The present rate is $10.

Manager Crandall of the Rialto Fruit Company reports mailing checks to lemon growers only 20 days after the last car in the pool was sent out. The following high prices were averaged net to the growers: Fancy, $6.58; Choice, $4.10; and Standards $3.20 per box.

The Coast and General

The prune crop of Oregon and Washington will be far below normal.

Deschutes County, Oregon, will hold a "fair and potato show" October 12-15.

Out of 7,000,000 acres of improved land in Washington, 2,500,000 are devoted to wheat raising.

Seattle and Portland combined expect to ship more than 5,000,000 boxes of apples during this summer.

The department of agriculture reports all Arizona crops good except corn, which rains came too late to save.

At a wool sale held at Shaniko, Oregon, 250,000 pounds were disposed of at prices ranging from 16 to 20 cents.

Government forecasts of the Washington apple crop indicate a crop of 20,488,000, as against 13,420,000 bushels in 1920.

A cattle growers association has recently been formed in the Black Hills district of Yavapai County, with Dave Wingfield secretary.

A new fruit warehouse, 100 by 110 feet, is being erected at Yakima, Washington, and a large addition to another is being made.

A new meat packing house opened at Snohomish, Washington, June 1, with a monthly capacity of 300 cattle, 400 hogs, and 1,000 sheep.

Bugs and blight threaten the canberry industry of southwestern Washington, and an expert from Washington, D. C., has been called.

Dr. F. W. Hodges, representing the Museum of the American Indian, is making excavations in the ancient and extinct village of Hawkiku in the Hopi Indian reservation of Arizona.

Permits have been granted for the grazing of 73,504 head of cattle on the Prescott forest reserve by the forestry service department. The Prescott forest consists of 1,500,000 acres of land.

Range conditions in Arizona have been greatly improved by recent rains. Some localities are yet badly in need of rain, and with few exceptions more rain is needed even where showers have fallen.

Cattle growers in the Prescott national forest of Arizona have united in ridding certain localities of wild horses. More than 500 have been captured to date and are being disposed of. These wild horses are usually inferior and of little value.

The cantaloupe season in the Salt River Valley has closed with total carload shipments of about 1,500. This is about 500 cars less than early estimates. Aphis caused considerable loss and the second setting of melons was considerably less than usual. Prices generally have been good.

The Arizona Pima Cotton Growers, otherwise known as the marketing association, recently incorporated, has elected for the first officials of the new association, Dwight B. Heard, president; W. S. Stevens, vice-president; Charles M. Morgan, secretary, and B. J. Showers, treasurer. The present membership numbers 713 and represents well over 50 per cent of the acreage.

Records as a Basis for Dairy Cattle Values

By R. P. Royce

WITH the splendid development of the pure bred dairy cattle industry in the state there is ample and convincing evidence that each season buyers are paying more attention to the official or advanced registry records back of their purchase and to a very large extent are making use of such records in establishing the range of values being placed on the cattle. Such being the case, it would seem that owners of pure bred herds will endeavor to increase the amount of official testing.

Of course the matter of an official record is by no means the sole factor in establishing values. Pedigree, individuality, health and condition are other factors of prime importance, not one of which is overlooked by the careful buyer. The recorded pedigree of any animal forms the real basis of value for the reason that only through such a record as is represented by the pedigree can one know the history of the individual. Therein lies the value of a pedigree and is constituted the distinguishing difference between a recorded and an unrecorded animal. The pedigree presents a correct history of all the progenitors of an animal back to the time when herd records were first established, and a complete pedigree contains a record of all official tests for butter fat and milk production. It follows then that a pedigree showing a high average of production for the dams of one animal would indicate that that particular individual was of greater value to a herd than one, the pedigree of which disclosed a lower average of production or no official records whatever. To make the point clearer, suppose we study two Holstein-Friesian pedigrees that follow:

QUEEN DE KOL IMPERIAL
Born June 2, 1915

VICTOR LAD DE KOL KING OF SCOTT 93067
By a paternal brother to the sires or dams of

A daughter of
Aaggie Anna's Imperial's Prince
and
Barrington Belle.

potential possibilities for increasing her last record. We find that her dam, Ruby Pietertje of Forrest Hill, made a 27.14 pound record when eight years old and that she had a second daughter that made a 15.32 pound record as a two year old. So far our information would indicate that Ruby Pietertje of Forrest Hill 2d must have had a good dam with ability to transmit her producing qualities to more than just one daughter. Turning to the sire we note that he was Ollie Johanna Sir Fayne and, at the time, had 21 Advanced Registry daughters with production up to 33.25 pounds of butter in seven days; that his sire had 47 A. R. O. daughters and his paternal grandsire 27 A. R. O. daughters. We note that his dam was the well known cow, Ollie Watson Prima Donna, a 31 pound cow that had two A. R. O. daughters and whose sire, Chief Piebe Oak Duchess, had 21 A. R. O. daughters, while her dam also had a seven day record.

Going back to the lower side of the pedigree we find that the maternal grandsire, Pontiac Paul, was the sire of nine A. R. O. daughters and the son of the great Hengerveld De Kol with 116 A. R. O. daughters and that her dam had a good seven day record and demonstrated her breeding and transmitting ability by producing five A. R. O. daughters. The maternal grand dam was an A. R. O. cow whose sire had two A. R. O. daughters but whose dam had not been tested. Taken as a whole the pedigree discloses that six of the seven nearest dams had A. R. O. records averaging 23.14 pounds of butter in seven days and five had produced two or more A. R. O. daughters. Every sire in the pedigree had demonstrated his ability to transmit production by siring from two to 116 producing daughters.

From such study of the pedigree one would be justified in assuming that Ruby Pietertje of Forrest Hill 2d would prove a valuable cow in any herd, provided she was of correct conformation and in good health and condition. Now it so happened that she was a splendid individual and in excellent condition and was purchased in one of the recent Guaranty Sales by W. J. Higdon of Tulare for $2,250. When she freshened she was carried on test and produced 39.75 pounds of butter in seven days and 162.09 pounds in 30 days, was sold in the National Sale at St. Paul last year for $10,500.

So much for Ruby Pietertje of Forrest Hill 2d. Let us examine into the pedigree of Queen De Kol Imperial.

Queen De Kol Imperial has no record of her own and not a single one of her seven nearest dams had a record. Furthermore her sire nor either of her grandsires were out of tested dams. A few of the sires had tested daughters, however. Such a pedigree would hardly be grounds for assuming that Queen De Kol Imperial would prove a valuable addition to a good herd even though it so happened that the lack of tested dams was entirely due to dircumstances and not to a lack of real ability and that estimation of her value was apparently entertained by her purchasers at the sale in which she was disposed of for she brought but $135. Even though the first cow had sold without a record, as was the second, the difference in values would have been marked, for back of the first is a long line of proven producers, while back of the second is scarcely any proven merit.

The two pedigrees referred to, while representing extreme cases, indicate the real value of a pedigree as a basis for establishing values. One provides a definite foundation on which to build, the other offers little. Because dairy

The Healthiest Trees Are in Sprayed Groves

—and that's a fact. Records open to your inspection prove it. For example, growers in Tulare County who used our sprays both winter and early summer packed about 90 per cent of fancy fruit. One spraying in summer gave about 75 per cent fancy. Those failing to spray at all had about 60 per cent fancy—some only 20 per cent.

These unchallenged records that spraying pays are furnished by your brother citrus growers in California. Why not ask them? Their groves—that showed the highest profits from fancy oranges—are sprayed regularly with

B. T. S.	15 lbs.	Per	B. T. S.	10 to 12 lbs.
TRIUMPH	1½ to 2½ gals.	200 gal.	TRIUMPH	1 gal.
GLUE	1 lb.	tank	GLUE	1 lb.
(For Citricola and Black Scale)			(For Red Spiders)	

(Patented Formulas)

The market wants fancy fruit again this year. You can make up for the drop in orange prices by increased production of fancy crops. Summer spraying with our field-tested, patented formulas "bring the pay."

Remember! The above formulas are specially adapted for summer control of citricola and black scale—and red spiders. Your bigger pack of fancy fruit will pay the costs many times over. Frank B. Herbert, our assistant entomologist, located at Los Angeles, will examine your grove free of charge.

Write today to our Los Angeles headquarters for a new free bulletin on citrus spraying by our expert entomologist, Paul R. Jones.

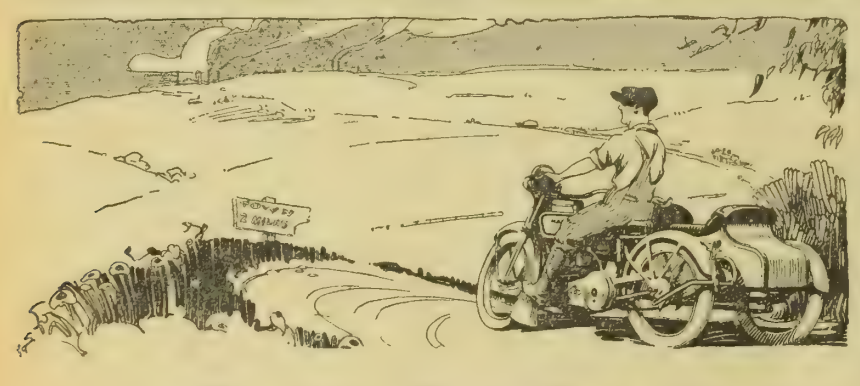
UNIVERSAL BRAND
ORCHARD SPRAY



The Quick, Cheap Way to Town

WHEN you've got to get a repair part for that broken down binder—when you want to make a quick trip to the postoffice, railroad station or creamery—yes, and when you want to quit work for half an hour for a cool dip in a nearby lake—you'll say your Harley-Davidson is worth its weight in gold.

Save your automobile for family use. A Harley-Davidson is just the thing for half of your business or pleasure trips. The roomy sidecar will carry most anything—milk cans, egg crates, sacks of flour or feed, tools, repair parts, etc.

The Harley-Davidson rides smooth and is easy to handle. You can use it every day in the year, even on roads that would "stall" an automobile. And fifty miles for a dollar—gasoline, oil and tires—is mighty cheap mileage, you'll agree.

Let us prove to you that a Harley-Davidson is an investment that pays the farmer big dividends. Write for FREE literature.

Attractive dealer proposition for unassigned territory. If interested, address Desk A-2.

Japanese Persimmons

By Ernest Braunton

FOR several years the demand for persimmons has strongly exceeded the supply, and each year these fruits come more into popular favor. In Japan they are so highly regarded and so universally consumed that they occupy there the same relative position as the apple in the United States, and are put to similar uses; for dried persimmons are a staple article of diet and commerce in the Far East.

Introduced into California about 1870 they have but slowly grown in consumption and in commercial favor.

Chinese Seedling Persimmons

There are more than 300,000 plants in this bed of Diospyrus Lotus, the best grafting stock for Japanese named varieties.

As long ago as 1891, now 30 years, the writer saw vigorous trees bearing an abundance of fine fruits about Newcastle, Placer County, and other northern points, yet none of these districts market them today. In Los Angeles Martin Wetzel and others planted Hachiyas on the east side of the river 47 years ago, and the trees have borne heavily each year the best of fruits. During this nearly half a century friends and neighbors have eagerly sought this supply of fruit, for none was to be had in the market. But now the general public is recognizing the delicious flavor and high nutritive value of these fruits and orchard planting is annually more extensive, though supply of trees has limited the acreage.

For best results the named varieties should be grafted on the Manchurian Diospyrus Lotus, a species growing wild throughout that part of China. The writer has just visited the orchards of J. A. Schoonover about two miles northwest of El Monte, Los Angeles County. Here, and elsewhere in the neighborhood, are many old trees of several varieties that have borne well for a considerable number of years. First Mr. Schoonover planted an acre, then several acres, and so on until this year he will plant another tract of 54 acres, perhaps more. Unable to get seedlings to bud on he secured a lot of seed from North China, in fact, a half million. The cost was small, and he thought enough of them would grow so he could supply all who asked for them, though he is not a nurseryman. More than 300,000 of them grew! He will not be able to graft all these but is cutting his orchard trees rather close and gathering good grafts wherever he finds them. Of those he grafted last year he will plant at least 5,200 on his own lands. All these are of the Hachiya variety, the one that thrives best in the south end of the state.

It is the best of the astringent varieties and of the non-astringents the Hyakume appears to be most popular. Another, of the later class, that is growing in favor is the Tamopan, which name we are told is Chinese for grindstone, so called because of its curious form. It is of large size and good flavor.

Persimmons may be planted in a wide range of soils and climate In sections too cold for citrus trees and so troubled with late and early frosts as to make planting of walnuts hazardous, the persimmon is finding favor. The only objection urged against the tree comes from extremely windy sections, for the wood is brittle and branches are easily broken, but as trees are low growing and windbreaks are easily provided this objection may be overlooked where other conditions are favorable. The procurable stock comprises about a dozen named varieties, and among these the better are, beside the three mentioned: Tane Nashi, Yemon, Dai Dai Maru, Costata, Gailey, Goshio and Zengi. Persimmon trees are easily transplanted, even when several years old.

Alfalfa for Fertilizer

THE shortage of manure in California has caused citrus orchardists and others to persistently ask, "What shall we do to save our orchards?" Some are answering their own question by using alfalfa hay, usually damaged or inferior hay at low prices, but often high grade hay. Riverside and Redlands growers have been testing out the use of alfalfa for some years. The Riverside Press has made canvass of the situation and reports:

"These experiments have been going on for four or five years, long enough to convince even the most skeptical that alfalfa hay is one of the best mediums to increase the organic matter content of the soil, especially the clay loams of the two districts above mentioned.

"According to these growers alfalfa hay has all the essentials necessary to a well balanced fertilizer. It is rich in nitrogen—a form of fertilizer most needed in Southern California soils. It carries to the soil a rich humus which improves its water holding power, makes it more friable and porous, gives it greater aeration, and puts it in a better condition to withstand the heat of the summer months.

"Experience has shown, too, that citrus groves respond to the treatment immediately. Trees have increased their fruit output materially the year following the first application of alfalfa. Enthusiastic orchardists will show you groves of orange trees which one year carried small, sickly, mottled leaves and the following year were foliaged with broad, rich colored, waxy leaves, the result of an application of from 75 to 90 pounds of alfalfa hay per tree. These enthusiasts declare that alfalfa makes the tree look better and grow a bigger crop of better fruit.

How Much to Pay

"'How much can a grower afford to pay per ton for alfalfa hay to use as a fertilizer on his citrus grove?' That is a question which is being asked by orchardists today. The National Orange Company of Riverside has paid as high as $23 per ton for baled alfalfa, chopped it, spread it, plowed it under, and considered it was good business. Dr. C. E. Lombard of Redlands used hay from his own fields, which he could have sold for $25 a ton, to fertilize some of his extensive acreage. He declares it was money well spent; that he really received the value of $25 a ton for his hay. Many others during the years of high priced alfalfa paid equally as much and considered they were justified in doing so. However, a consensus of growers' opinions would regard from $15 to $20 a ton a conservative price to pay. That is, compared to the price of other fertilizers. Of course it depends somewhat on the price of fruit, but your price is more likely to be top notch if you use the proper fertilizer.

"Probably one of the most enthusiastic over the efficacy of alfalfa as a

fertilizer is Dr. Lombard. He has been using alfalfa for the past five years and declares his experience gives him authority to speak on the subject. Dr. Lombard has used a great many varieties of fertilizers on his many groves near Redlands. Barnyard and commercial fertilizer he has used in large quantities. He has tried both summer and winter cover crops, vetch and melilotus alba, but is satisfied that alfalfa hay, chopped fine and carefully plowed under in early December, will surpass them all.

"Dr. Lombard was impressed with the value of this method of fertilization during the disastrous June hot wave of four years ago. His experimentation with alfalfa had only begun the year previous. At that time he had applied a covering of 90 pounds to a tree on one of his groves. The foliage on these trees in response to the alfalfa treatment was so dense and afforded so much shade to the fruit that his loss was almost negligible. While surrounding trees dropped nearly all their fruit, his trees, alfalfa fertilized, produced a good crop of splendid fruit which had the advantage of a high priced market.

Should Be Plowed Under

"Dr. Lombard is emphatic that the only way to secure results by the mixture of alfalfa with the soil is by thorough plowing. The closer you get the chopped alfalfa to the root system the better, in his opinion. He is satisfied disking will not answer the best purpose because the disk will not completely cover the alfalfa and this he believes is necessary if best results are to be obtained. Deep plowing also tends to decrease loss by oxidation during the heated months. It is also best to spread the fertilizing element between the rows in the direction the water runs, because it will the more quickly form humus if it has the advantage of abundant water.

"Dr. Lombard was attracted to the use of alfalfa as a fertilizer five years ago by the splendid condition of a few rows of trees in the orchard of a friend near Pomona. This friend had applied 125 pounds of alfalfa hay to each tree the year previous, and their remarkably thrifty appearance in contrast with the other yellow leafed trees in the orchard gave the doctor his first lesson in proper fertilization. He was so impressed that he decided to give alfalfa a trial. He used 90 pounds per tree with his first application. Later he used 75 pounds and even as low as 50 pounds per tree. However, he declared 75 to 80 pounds is ample provided it is carefully plowed under. Good, well cured alfalfal is another requirement. The better the hay the better the fertilizer, Dr. Lombard declares.

"Two other Redlands orchardists who have given alfalfa hay a tryout as a fertilizer in their orchards are A. Gregory and W. E. Grigsby. These men have fertilized with alfalfa hay long enough to know whereof they

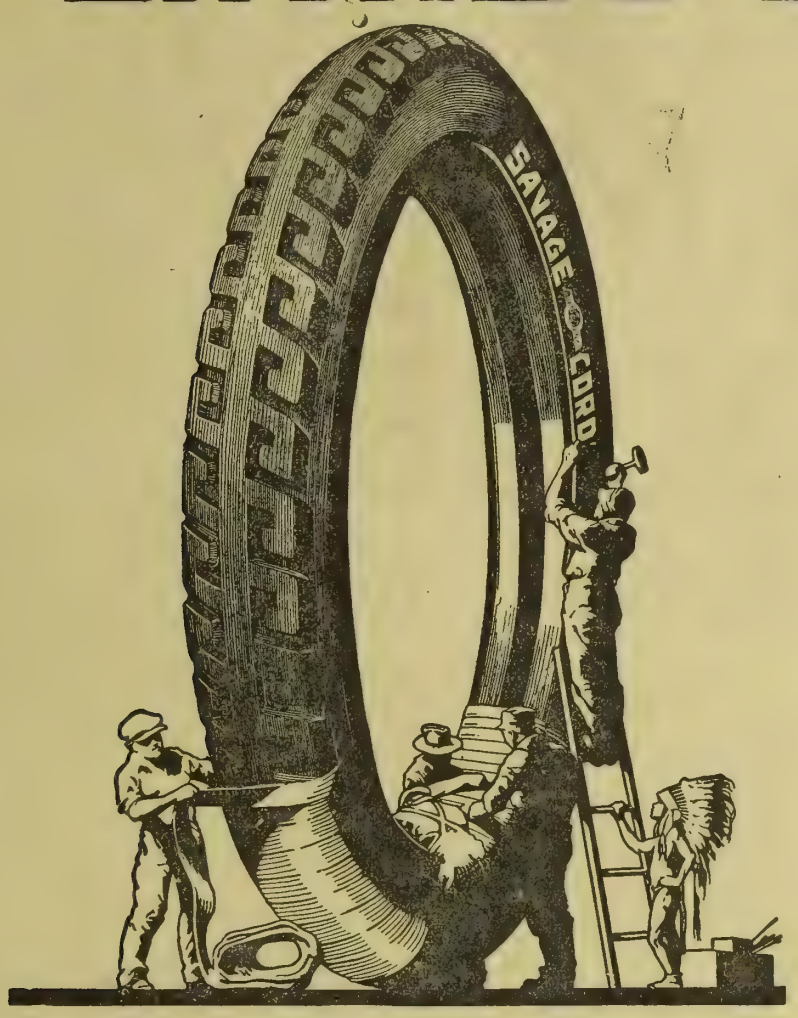
THE NEW SAVAGE CORD



SAVAGE CORDS

give unusual service because unusual materials and methods are used in their construction. Hand built to the smallest detail, they carry two extra plies of special fabric, absolutely pure gum friction cushion and side stock, and a tough, elastic tread.

We guarantee that not an ounce of shoddy or adulterants is used in either casing or tube.

BUILT TO EXCEL

A MIGHTY TIRE

FOR THE FARM

Agricultural requirements call for tires designed and built to render uninterrupted service with the greatest economy, irrespective of loads, roads or weather.

The Savage organization recently produced a tire incorporating the most desirable modern attainments and features in cord tire construction—a tire of unquestionable quality, built to render the maximum of uninterrupted service.

This tire, the Mighty Savage Cord, rapidly gained recognition as a tire of mechanical excellence and unexcelled performance ability and set a pace in economy and dependability that gives the purchaser greatest mileage in proportion to his investment.

HAS MANY FEATURES

The Savage Cord is built of the finest materials procurable and contains from one to two more plies of cords in each size than is the general practice. This gives the carcass of the Savage Cord its great strength and endurance.

It has what is considered by many experts the most durable and scientifically designed tread ever produced, embodying effective non-skid features as well as providing for positive traction.

EXTRA THICK

The side wall is extra thick as a precaution against rut wear. And in the larger sizes a new "bumper" greatly strengthens and protects the side wall, a feature especially adapted for country roads.

The interlocking cord bead is unusually strong, preventing rim cutting, tube pinching, side-wall chafing and other troubles ordinarily encountered when beads are weak.

The Mighty Savage Cord is the ideal tire for the country motorist who demands the very best and wants long-continued, trouble-free tire service at the lowest cost per mile for service rendered.

August in the Vegetable Garden

Southern California

By D. F. Reichard

AUGUST for the Southern California gardener is a very busy month. It is the month in which we get ready and start planting our gardens for winter crops. Getting ready is a very important part of a successful garden. First of all, spread over the surface to be planted fertilizer in concentrated form, either a complete commercial fertilizer or the ingredients separately, keeping in mind that there must be supplied the three elements: Nitrogen, 2 to 8 per cent; phosphoric acid, 5 to 10 per cent, and potash, ½ to 3 per cent. These concentrated fertilizers are more quickly available and therefore more desirable at this time when immediate results are wanted. Then thoroughly soak the ground either by letting a sprinkler run till the soil is wet down to the submoisture, or furrow out and let the water run slowly down the rows or check the plot off in basins to be filled with water. Whichever way is used see that the moisture applied reaches the submoisture that is usually 18 to 24 inches down. This should be done about ten days before you expect to plant.

After a couple of days, when the ground will work up nicely without sticking to your tools, spade or plow as deeply as possible and thoroughly pulverize. With some crops, such as lettuce, the irrigating and plowing must be done twice to get the ground in condition to get a good germination of the seed; while with peas the ground has to lie about ten days after plowing and pulverizing to get it warmed up enough to prevent the pea seed from decaying before they sprout. In this case care must be taken not to allow the ground to get dried out too much—keep the surface in a very fine mulch.

Plant all seeds about twice as deep this time of the year as in the spring. Small seeds like lettuce, carrots and cabbage cover an inch and a half; beets, radish and parsnips about two inches; peas, corn and beans plant in the bottom of shallow furrows, covering the seed 2½ to three inches.

The following small seeded crops can be more successfully grown if planted in ridges so that water can be run on either side to soak in to the seed without making a cake over the top of it; beet, carrot, lettuce, turnip, parsley, parsnip, endive, chard, kohlrabi, radish, spinach, kale and cabbage.

Sweet corn, summer squash, cucumbers and bush string beans can be planted during the early part of the month with assurance of making a crop in most any section, while in frostless sections they can be planted even into next month.

The principal planting of winter potatoes is made between August first and fifteenth. Plant on the level four or five inches deep. It will take them three or four weeks to come up. When they are up enough to show the rows, cultivate, leaving a small furrow between the rows, and as soon as they need water irrigate down these rows, after which cultivate when ready, leaving a little larger furrow in which to irrigate later. Continue this method till your crop is made.

It is too late, except in very favored spots, to plant pole beans, watermelon and muskmelons and pumpkins — it takes too long for them to mature.

Remember that at this time of the year the sun is working full time, taking moisture from your growing plants and the ground, and that it must be supplied by you through some method of irrigation; also that insects and diseases are always waiting to make an attack. Keep and use preventives and cures on hand for immediate use when needed.

Keep the surface of the ground well stirred to keep down weeds and conserve moisture.

Northern California

By A. R. Gould

THERE is always a reward for the gardener and during the next few months the harvest should be plentiful to those who have given their crops careful cultivation and study, and here we would point out that it is unreasonable to expect quality crops without strict attention to systematic fertilizaion and irrigation. All soils need careful study, and much time and labor will be saved as a result. If mistakes were made this season do not fail to note them in your record book. Keep track of all the errors. Remember the old saying, "The man who never made a mistake never made anything." The man who never learned by his mistakes is a fool. Now is the time to take note of every detail.

A number of crops will be ready to harvest this month. Chief of these will be onions, potatoes, corn, beans, carrots and beets. Any of these not required for immediate use may be stored in a dry cellar or the barn. Beets, potatoes and carrots may be covered with dry sand. Onions may be hung up and the corn placed in trays so that they may be frequently inspected as the corn worm will often be at work. When digging be careful not to bruise such crops as potatoes, beets and carrots, and all diseased should be destroyed.

Leeks and Celery

These should now be getting well established in the trenches and must not be allowed to suffer for want of water. Keep the soil well cultivated between the plants. At the end of the month give an application of liquid manure. Soot should also be applied very liberally as this not only acts as a fertilizer but will help to keep away cutworms, etc., which are fond of attacking these crops.

Beans

Make a sowing of Canadian Wonder and Golden Wax at once for late fall use on well prepared soil in rows two feet apart. Collect all matured beans and use for dry shell beans, and the best types keep for seed. Thin out those sown last month, leaving the plants one inch apart in the rows to allow for proper development.

Tomatoes

This crop now shows great promise and there should be a fairly good yield. They may be assisted by an application of liquid manure twice weekly. Where the trained method is adopted all lateral growth should be pinched out, or axil shoots, and when grown on the ground as bush plants there will be a certain amount of surplus growth which may be removed to allow the fruits to ripen more quickly. The appearance of aphis will probably be noted and this should be attacked with Black Leaf 40.

Corn

Make a sowing of Golden Bantam and Country Gentleman for late fall use on ground that has been well manured and irrigated. Cultivate between the rows of the varieties sown last month and irrigate. A frequent dusting of dry lead arsenate on the silks of the ears as they develop will be necessary to destroy the corn worm. Collect all cobs as they mature and store those not needed immediately, for future use.

KIRKMAN NURSERIES

Reliable Trees and Vines

For Commercial Orchard and Vineyard Planting

Deliveries made direct from nearest propagating plant. To serve the orchard and vineyard planters of California to the fullest satisfaction and efficiency is our aim. We are gratified to have entrusted to us the future of small orchards as well as the large projects. One acre of Kirkman Trees will draw to us greater future plantings. One California orchard has taken two hundred and fifty thousand of our trees. Another four hundred thousand trees. Another six hundred thousand trees and vines together. They have reservations with us for their next season's plantings. The Ex-Governor of Coahuila, Mexico, named his immense project "El Fresno" in honor of our deliveries of nursery stock. We plan to serve every customer so satisfactorily that his future profits will be assured. Correspondence solicited.

Kirkman Nurseries

Fresno, California

Member of Nurserymen's Bud Selection Association of California

Lettuce

Make a successional sowing of Los Angeles and May King, both good varieties for fall use. Sow the seed very thinly in rows 18 to 24 inches apart. Keep well watered and cultivated. Thin out those sown last month, leaving the plants six to eight inches apart in the rows.

Kale and Brussels Sprouts

Plants of these should be ready to plant out at the end of the month on richly prepared soil which should also be well irrigated before planting. Kale makes excellent green feed for poultry and should be extensively planted.

Turnips and Kohlrabi

Thin out the sowings made last month, leaving the plants eight inches apart in the rows. Cultivate frequently and irrigate to get the best results.

Onions

The main crop of onions will be ready to harvest during the latter part of this month, and as the tops become yellow, which is an indication of maturity, they should be pulled and dried in the sun for a few days before being stored away.

Cauliflower

Secure plants of these for planting out in rich soil. Best varieties Autumn Giant and Early Snowball. Plant 18 inches apart in rows which should be two feet apart.

August in the Ornamental Garden

Northern California

By A. R. Gould

IT will be necessary this month to look over the seed list to select suitable subjects for our spring flowering display and there are a number of useful things we can select to sow seed of to provide a charming picture in our beds and borders. Our fall flowering subjects, such as dahlias, cosmos and zinnias, will need special care in cultivating, and the first two named will require stakes. Chrysanthemums also will need feeding with liquid manure, while begonias will derive much benefit from it. Continue to tie up all climbers as there will be much new growth on wistaria, roses, jasmine, cobea scandens, etc., and these should also be mulched with manure. As the annual flowering plants die down remove them and prepare the ground with manure for future planting.

Subjects for winter and spring flowering are:

Sweet Peas—Winter Flowering Types

Of these there are now quite a few beautiful varieties. Seeds may be sown late this month in trenches which should be prepared with well mixed manure to insure success. Soak the seeds at least 12 hours before sowing.

Cinerarias

These are very satisfactory flowering plants and thrive in a shady situation. There are the dwarf large flowered types in shades of rose and blue, separate colors and mixed shades, also a tall flowered type with smaller branching star shaped flowers in blue, purple, white, rose and other shades. Seeds of these may be sown now in boxes of fine soil, placed in a shady position and later transplanted to their flowering quarters.

Sweet Williams

These old fashioned flowers give a charm to every garden and may be obtained in several colors, pink, white, crimson and velvet maroon, while there is a fine mixed strain of auricula flowered known as Holborn Glory.

Violas and Pansies

Both well known subjects which provide a lasting color display. May be had in separate colors or mixed. Sow seeds of the best strains in seed beds or boxes, afterwards transplant to other beds to secure strong healthy plants before placing in their flowering quarters.

Nice Stocks

These are really very valuable as a cut flower and keep in flower for many weeks during winter and spring. Sow seeds of these now in boxes of fine soil or on a shady border in rows, and after they are half an inch or so high they should be transplanted to other beds.

Snapdragons

These are popular flowers, and seeds of the tall flowered and semi-dwarf varieties should be sown in boxes of fine soil very thinly.

Clarkia

Graceful flowers of easy culture in varieties of salmon, purple and scarlet. Excellent cut flowers in early spring. Sow the seeds in the border very thinly where they are to flower or they may be sown in the seed box and transplanted.

Forget-me-not

Seeds sown now will produce flowers for early spring flowering. Planted in solid beds or between the tulips these will make a fine show. Sow in boxes of fine soil and transplant.

Dimorphotheca Aurantiaca

This is the African Golden Daisy and sown where it is to flower will produce a mass of flowers in the spring. Sow in rich soil thinly.

Alyssum Saxatile

A useful golden yellow subject for the border as an edging or the rock garden. Sow in boxes of fine soil now and later transplant. It will flower in the spring.

Chrysanthemums

These will require every attention now and should be given liquid manure at least once a week and later on they will need staking. To make them more bushy they may be pinched back. If aphis appears spray with Blackleaf 40, nicotine solution.

NEW PLANS FOR UNIVERSITY FARM SCHOOL

The work of the farm school of the University of California will be greatly strengthened this year by the addition of more highly specialized courses. Opportunities for specialization will be offered along four distinct lines, permitting a choice of animal husbandry, dairy manufactures, poultry husbandry, or horticulture. From one-third to one-half of each student's time will be given over to one of these branches. The rest will be occupied either with allied subjects or with practical work in forging and carpentry. Opportunity will also be offered for the election of such subjects as botany, chemistry, English and economics. Under these plans a student will have at the end of one year's time an excellent understanding of one particular line of work in which he may be particularly interested.

BEAUMONT CHERRY RETURNS

The Beaumont Fruit Growers Association reports net returns to growers on cherries: Tartarians, first grade, per 100 pounds, $17; seconds, $8.85; Royal Anns, $8.75; Chapmans, $13.86; Bings, firsts, $13; seconds, $11; Black Republicans, $7.52; Lamberts, $13.25; Sour, $6.18. These prices compare favorably with returns to Oregon growers as reported in the Packer of recent date. For Bings and Lamberts they received 10 cents per pound net; for Black Republicans, 6 cents, and for Royal Anns, 4 to 5 cents.

Quarantine Officer Compere reports the arrival at San Francisco of 22 crates containing 10,600 Carabid beetles. The beetles are predatory on the Japanese beetle (Popillia japonica) and were forwarded by C. P. Clausen from Yokohama to the U. S. department of agriculture, Riverton, New Jersey.

FISK TIRES

THERE is no other tire just like it.

Built to stand against the wear of ruts and sand.

The most desirable tire in the world for the all-around use of country driving.

Fisk Red-Top

30 x 3½

Extra Ply of Fabric—Heavy Tread

SPECIAL construction gives extra strength and long life.

A safe tire because it has a deep cut, real Non-Skid tread.

A tire so individual in looks that its use stamps the user as a discriminating buyer who selects a quality tire built to meet his personal requirements.

Test this tire against any you have been using. The result will show you how to save money on your future tire mileage.

ALFALFA FOR FERTILIZER

(Continued from Page 151.)

speak, and they declare that alfalfa hay at $15 or $20 a ton will give a good return on the investment as compared with any other means of supplying organic matter and nitrogen to the soil of their groves.

Results in Riverside District

"In the Riverside district the largest user of alfalfa as a fertilizer is the National Orange Company. This company has been using alfalfa for about five years, and, according to F. F. Chase, secretary of the company, has achieved splendid results. Mr. Chase gives it as his opinion that this method of supplying organic matter to the grove has equal value with the application of stable manure. Because of the scarcity of stable fertilizer, Mr. Chase says his company was forced to resort to alfalfa. 'We have given it trials under varying conditions during the past five years and are well satisfied with results. Last year we used a large quantity of alfalfa and expect to use considerable tonnage this year.'

"Mr. Chase declared analysis made for them showed from one to three per cent nitrogen. It all depends on the cutting and the condition and richness of the soil on which the hay was grown. Hay of the first cutting will contain a greater nitrogen content as will also hay grown on a rich soil with plenty of water. Mr. Chase, however, is not averse to using hay which has been spoiled by rain and therefore musty and not fit for stock consumption. Of course, this kind of alfalfa lacks a high nitrogen content, but then it can be bought cheaper and therefore evens up with the good article.

"Asked how much his company could afford to pay for alfalfa for fertilizer purposes, Mr. Chase declared that as being the crux of the entire matter. 'Last year paid as high as $20 a ton for the baled product and then chopped it ourselves. This is a pretty high price, but we were forced to pay it because of the high market. This year, however, market price of alfalfa is lower. This year, too, it will come into competition with a great surplus of stable manure now on the market.' Mr. Chase says his company has been solicited time and again by fertilizer men to supply this year's needs with stable manure. He says the National Orange Company has decided to use alfalfa in preference because it is the belief that good alfalfa will measure up to the best barnyard article.

Groves Need Fertilization

"Just now a great deal of unfavorable comment is going the rounds among orchardists because of the low average production of orange trees in California counties shown by the United States department of census report. Growers are charging this low average, which is as low as 1.4 boxes per tree in Riverside County, to a lack of fertilization.

"E. C. Merrifield of Colton, recognized as one of the best posted men in the citrus industry, attributed the decrease directly to the increase in freight rates on fertilizers. 'Fertilizers cost too much,' he says, 'and growers have simply neglected their groves.'

"It is pointed out by citrus growers that there is no need of alfalfa men paying freight on their product to central markets when they could deliver hay right at home to the advantage of some under-fertilized grove. Enthusiasts of the alfalfa method declare if lack of fertilization is responsible for the decrease in tree output it is folly to ship alfalfa out of their districts when it contains all the necessary ingredients to put back the productive power into the under nourished citrus tree.

"One of the drawbacks which has faced the average orchardist in the use of alfalfa is the necessity of chopping. To be effective it must be

TEAGUE TREES

chopped reasonably fine, and not many have the equipment for doing this. However, this drawback will be overcome by the Alfalfa Growers of California in the near future. According to officials of the growers association, equipment for chopping will be installed at various points as the demand requires, and the association will contract to deliver the chopped product directly to the groves."

SECOND ANNIVERSARY

The second anniversary of the birth of the state department of agriculture was observed July 22. There was a general gathering of various members of the department and one feature was presentation to Director Hecke of an album containing their photographs. The celebration also was in honor of the enlarging of the department because of the concentration made necessary by the law passed by the recent legislature. It is but a few years since the board of horticulture had but little to do with the state's advancement, but its activities have grown year by year until now it is one of the strongest arms of the state government.

PRIZES FOR CAROBS

There are thousands of seedling carob (St. John's Bread) trees now fruiting in California. For the most part these are in yard, garden, or street planting. In order to bring the fruit of these seedlings together where it may be studied by expert judges and the very best selected for future commercial propagation, the California Nurserymen's Association has offered $50 in prizes to be awarded for the best exhibit of fruit from a seedling carob tree grown in California.

There is no charge for entering and application for the number of entries should be made to Henry W. Kruckeberg, 236 Court Street, Los Angeles, before September 20. One person may make as many entries as he has fruiting trees. Each exhibit will consist of two pounds of the ripe pods, all from one tree, together with a statement of the age of the tree and where it is growing. Exhibits should be sent by parcel post or express prepaid to Superintendent California Horticultural Exhibition, Armory Hall, Exposition Park, Los Angeles, to arrive not later than October 18.

COMMENT ON "CANTALOUPES IN TRANSIT"

In the Cultivator of July 23 is an article on cantaloupes in transit, upon which I would like to make a remark because I have found things exactly as that article states.

It is now over seven years since I have bought any cantaloupes in the New York or Jersey City markets because of poor quality, bad odor and unripeness of fruit. Getting one good melon out of ten is scarcely worth trying at 10 to 20 cents per melon, or pre-war prices of five to ten cents.

In the summer of 1918 I had a California farmer on a visit for a week and he tried his hand at buying some good California melons but I can assure you that he failed to get one that was A-1 because I know a good one when I have eaten it. I sincerely hope that the article you have printed will do some good, and I thank you for same.—Frank W. Loven, Jersey City, New York.

No "Half Slips"

In your issue of July 23 an article by L. J. Weishaar, "Observing Cantaloupes in Transit," I consider a very complete and beneficial bit of information for cantaloupe growers and shippers. In one or two places in writing I find he uses the term half slip for a certain stage of the melon. Now from my own ten years of experience in cantaloupes I would say there is no such a thing as a half slip, and the term only serves to mislead the pickers. A full slip does exist, when the stem can be easily detached from the melon. There is no time during the growing of the melon that the stem will slip from the melon so that you can determine its ripeness for the stem acts the same on those that are two weeks away as it does on those that are but two or three days from being full slips. I think the expression was created by some would-be inspector, who probably had hoed cantaloupes a couple of months as a recommendation. — A Subscriber, Lodi.

GEORGIA PEACHES

One of the first cars of peaches out of the Fort Valley section, Georgia, packed and marked in accordance with the United States tentative grades for peaches, sold at top prices on the New York market, June 18, according to a report to the bureau of markets and crop estimates of the United States department of agriculture. They brought $3.25 per six basket carrier for the U. S. No. 1, 3-2 pack, and $4 for the U. S. No. 1, 2-2 pack. An agent of the bureau is in Fort Valley supervising this work and expects to have a large number of cars packed on this official grade basis.

The federal specifications provide for two grades for quality to be called U. S. No. 1 and U. S. No. 2, and in addition, the marking requirements demand that the minimum size, numerical count or style of pack be stated on the package. The U. S. Grade No. 1 shall consist of peaches of one variety which shall be firm, mature and well formed, free from dirt, growth cracks, cuts, skin breaks, and worms, and practically free from scab, scale, hail injury and damage caused by disease, insects, or mechanical or other means.

U. S. Grade No. 2 shall consist of peaches of one variety which shall be firm, mature and free from worms, growth cracks, and serious damage or discoloration caused by diseases, insects, hail, or mechanical or other means.

INYO COUNTY FAIR

The Inyo County farm bureau, the Bishop chamber of commerce, the Owens Valley Pear Growers Association and the American Legion are uniting in featuring one big agricultural fair to be held at Bishop, October 4, 5 and 6. The officers of the fair are: T. G. Watterson, president; C. T. Thompson, vice-president; V. M. Christopher, second vice-president; and W. W. Yandell, secretary.

To meet expected increased enrollment the regents of the state university have made 180 new appointments to the teaching staff. Twenty professors were granted sabbatical leave of absence.

CALIFORNIA JOYS

By Mrs. J. W. Reed

Our own California how dearly we love thee.
What joys for the farmer unceasingly lurk.
How great are his joys and how many his pleasures
With nothing whatever to do but just work.

He rises up early, four-thirty at latest.
The earliest birds his company keep.
He milks thirteen cows and he curries nine horses
And rigs up his tools while his city friends sleep.

Ten minutes for breakfast—the time he begrudges.
Officially, now starts the work of the day.
The new mown alfalfa is waiting his pleasure
And soon he is cheerfully pitching the hay.

The mercury rises but there is a limit.
It goes to one hundred and twelve in the shade,
Though we must admit that in all California
In no cooling shadow was hay ever made.

At last it is noon — fifteen minutes for dinner.
While horses and hired men rest at their ease
He merrily shoulders his long handled shovel
And goes forth to irrigate all his young trees.

The afternoon lures him away to his vineyard.
He exchanges his spade for the heaviest hoe
And what the rabbits and squirrels have left him
He patiently manicures row after row.

The shadows grow longer, at last it is sundown.
The hinge in his back is beginning to squeak,
But he must eat supper and then chores and milking—
These things only come fourteen times every week.

The day's work is ended and now evening's pleasures
Are his, and he starts to the barn with his pails.
He milks all the cows and he mends the old harness,
He oils up the pump and he drives a few nails.

You ask who is there in this whole creation
Who lives a more strenuous, busier life
Than this same California rancher?
Without hesitation we answer—his wife.

Our own California, we love thy dear ranches.
We would not be merchant or banker or clerk.
Their jobs sometimes fail them but ours, no never.
There's nothing to do on a ranch but just work.

COOKIES FOR EVERYBODY

SO generous has been the response to request of Gilroy subscriber for recipe for plain rich cookies that we are able to offer Cultivator readers 45 of them, all tried and tested favorites. Recipes for snails, requested by the same subscriber, will be given as soon as space permits.

Two eggs, 1 cup sour milk (buttermilk is best), 2 cups sugar, 1 cup lard or Crisco, 1 teaspoon soda, 1 teaspoon baking powder, nutmeg, a little salt, flour enough to roll thin. Cut and bake light brown.

Petaluma Subscriber

Cream Cookies. — We enjoy your paper very much and often receive good help from it. I see from last number a request for recipe for rich cookies and snails and will beg to give both. Two cups sugar, 1 cup shortening (butter is best), 1 cup sour cream, 2 eggs, 1 teaspoon soda (level), 2 teaspoons baking powder, a little salt and lemon extract. Mix to stiff dough, roll out, cut and bake.

Mrs. F. H. Merlan, Los Angeles

Having just returned from our vacation in the beautiful Yosemite Valley, I find in your paper a request for a good rich cooky recipe. This recipe I am sending is tried and true and can be kept indefinitely without getting stale. It makes about five or six dozen medium size cookies and can be kept in any kind of climate. This year I doubled the recipe and took them to the valley with us. And last year I took them to Redondo Beach with us where we spent our vacation. I always keep them in a tin covered box like they use at the grocery stores. I will also send a first class sour milk recipe and to either recipe can be added fruits, nuts or chopped raisins. These recipes have been used in our country home back East in Nebraska for over 50 years and mother and sister are still using them.

Lemon Cookies.—One cup sugar, ½ cup butter, 2 eggs, pinch of salt, ¼ teaspoon soda dissolved in 1 teaspoon sweet milk, 1 teaspoon lemon (or any flavoring), just enough flour to make a soft dough. Roll thin and bake in quick oven.

Good Sour Milk Cookies.—Two cups sugar, 2 cups butter, 1 cup sour milk, 3 eggs, salt, nutmeg, 1 teaspoon soda dissolved in 1 teaspoon milk, flour to make soft dough. Can use only half of recipe.

Mrs. J. W. Reed, Delano

One cup sour cream, 1 cup shortening, 2 cups sugar, 3 eggs, 1 teaspoon soda, 1 teaspoon nutmeg, 1 teaspoon baking powder, flour to roll.

Mrs. L. Hansen, Simmler

Plain Rich Cookies.—2½ cups sugar, 1 cup butter (cream well), add 3 eggs, 1 cup thick sweet cream, 2 large teaspoons baking powder, flour to make soft dough. Roll very thin, sprinkle with sugar and bake in hot oven. This recipe has been a favorite for three generations.

Mrs. C. E. Clark, Lime

Plain Rich Cookies.—One and one-half cups sugar, 2 eggs, ½ cup shortening; I use suetene, but any will do (if butter is used take one whole cup), 1 cup thick sour cream, 1 teaspoon salt, 1 level teaspoon soda and 1 of baking powder, or 3 teaspoons baking powder, sifted with 1 sifter full of flour. Use any flavoring desired. Mix stiff enough with flour that dough can be rolled without sticking. Cut out, bake in hot oven.

Mrs. A. Inglett, Los Angeles

Sugar Cookies. — Two cups white sugar, 1 cup shortening, 2 eggs well beaten with a little salt, 2 cups sour cream or 1 cup condensed milk and 1 cup sweet whole milk. Flavor with vanilla or 1 teaspoon nutmeg. Use 4 cups of flour or more, just enough to handle dough. If sweet milk is used sift 2 heaping teaspoons baking powder with flour. If sour cream, use 2 level teaspoons soda. Handle as little as possible. Roll and bake in quick oven. These are rich and flaky.

Mrs. Wm. Jolliff, Modesto

Cream Cookies.—Two cups sugar, 2 eggs, 1 cup sour cream, 1 cup butter or ½ lard, 1 teaspoon soda, 1 teaspoon lemon or ½ teaspoon nutmeg, flour enough to make a dough soft enough for rolling.

W. P. Rembert, Lindsay

I am sending recipe for cookies, the kind wanted by subscriber from Gilroy. They are crisp and flaky and the best by far I have ever tried: Take 2 cups sugar, 1 cup shortening, 1 cup milk, 2 eggs, 1 rounding teaspoon baking powder, any flavoring preferred (I use lemon extract or nutmeg), cream altogether), use enough flour to make dough soft as can handle. Roll and cut out and bake in oven not too hot. If any shortening is used other than butter add a pinch of salt.

Mrs. E. N. Workman, Hanford

Plain Rich Cookies.—As per your request for a recipe for plain rich cookies I send one which never has failed me: One-half cup butter or Crisco, 1 cup sugar, 1 tablespoon milk, 2 eggs (well beaten), ¼ teaspoon salt (if Crisco is used double amount), 2 teaspoons baking powder added to 2 cups flour and sift, flavor with nutmeg. Cream butter, add sugar, and when creamy the remaining ingredients. Roll, cut in rounds and bake in quick oven.

Coconut Cookies.—One cup sugar, 1 cup butter, 2 eggs, ½ cup milk (scant), 1 cup coconut, 1 teaspoon baking powder, using flour enough to roll out. Bake in quick oven. This brought me first premium at Kings County fair.

Mrs. J. W. Waters, Watsonville

Vanilla Cookies (Good). — Cream one-third cup shortening (use butter and lard in equal amounts). Add 1 cup sugar gradually. Add 1 egg well beaten, ¼ cup milk, 2 teaspoons vanilla, and 2 cups flour mixed and sifted with 2 teaspoons baking powder and half teaspoon salt. Chill, roll and bake.

The Cultivator Patterns

3337. Child's Play Suit.—Cut in four sizes: 2, 4, 6, and 8 years. A 6 year size will require 2⅝ yards of 27 inch material for the dress and 1⅜ yard for the bloomers. Price 10 cents.

3680-3671. Ladies' Costume.—Waist 3680 cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3671 cut in seven sizes: 26, 28, 30, 32, 34, 36, and 38 inches waist measure. For a medium size 7⅛ yards of 27 inch material will be required if made of one material. If made as illustrated 5 yards of figured material and 2⅝ yards of plain material will be required. The width of the skirt at the foot is about 2 yards. TWO separate patterns 10 cents FOR EACH pattern.

3659. Girl's Dress.—Cut in three sizes: 12, 14 and 16 years. A 14 year size will require 3¼ yards of 38 inch material. Price 10 cents.

3664. Bath or Rest Robe.—Cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size will require 4¾ yards of 36 inch material. Price 10 cents.

3665. Child's Play Dress.—Cut in five sizes: 2, 4, 6, 8, and 10 years. A 6 year size will require 2½ yards of 27 inch material. Price 10 cents.

3670. Ladies' Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 5½ yards of 40 inch material. The width of the skirt at the foot is about 2 yards. Price 10 cents.

3663. Girl's Dress.—Cut in four sizes: 8, 10, 12 and 14 years. A 10 year size will require 3¼ yards of 38 inch material. Price 10 cents.

3249. Porch or Home Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It will require 6¼ yards of 36 inch material for a medium size. The width of skirt at its lower edge is 2 yards. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Fall and Winter 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

M. B. S., Lindsay

Recipe for plain rich cookies, to be rolled instead of dropped on the baking sheet. I enclose one which I have found to be very good, both plain as given, or when a little cocoa or cinnamon is added. One cup sour cream, 1 cup sugar, 1 teaspoon soda. Flavor with vanilla or nutmeg, flour to roll.

Mrs. E. M. Mather, Fullerton

This recipe is one I have used for years:

One cup shortening, 2 cups sugar, 5 eggs, 1 teaspoon vanilla and 1 of lemon extract, 1 teaspoon soda and 2 of cream of tartar or three teaspoons baking powder. Don't use any wetting but the eggs.

Mrs. S. M. Lindensmith, Arroyo Grande

White Cookies.—Two eggs beaten separately, 1 cup sugar, ½ cup butter, ½ teaspoon soda dissolved in 1 tablespoon of water, 1 teaspoon vanilla, flour to make dough stiff enough to roll. Cream sugar and butter, then add well beaten yolks of eggs, add soda and a little flour, then add the stiffly beaten whites of eggs and balance of flour and vanilla. Roll out about ¼ inch thick and bake in moderate oven unti llight brown. Sugar may be sprinkled over tops before baking if desired. These cookies will be found nice, rich and crisp.

Subscriber from Orange

Extra Fine Cookies.—One cup butter, 1 cup sugar, ½ cup milk, 2 heaping teaspoons baking powder, 2 teaspoons lemon extract, 3 eggs, flour enough so you can handle easily.

R. A. C., San Fernando

Good Sugar Cookies.—To make good cookies mix the dough and let stand in a cool place over night, or if this is not convenient put the dough in the ice box for an hour or two. If the dough is let stand until thoroughly cooled it will take less flour to handle it. The dough should be mixed as soft as it can be rolled out as too much flour makes them hard. If the dough is rolled thin the cooky will be crisp and tempting while if it is left with twice the amount of dough it will be soft and unappetizing.

Mrs. W. D. Phare, Redlands

Here are two cooky recipes in answer to request in July 30 number:

One and one-half cups sugar, 2/3 cup shortening, 2 eggs, 3 tablespoons sour milk, ½ teaspoon soda, 1 teaspoon salt. Flour to make stiff enough to roll out. Sprinkle sugar over top before baking.

One cup shortening, 2 cups sugar, 2/3 cup sour milk, ½ teaspoon soda, ½ teaspoon baking powder, 1 teaspoon salt. Flour to make stiff enough to roll out. Either recipe may be varied by adding spices.

C. J. E., Oakland

Plain Rich Cookies.—These are the cookies "like Mother used to make."

One cup butter, 2 cups white sugar, 1 cup sour cream (½ cream and ½ buttermilk), 2 eggs beaten, 1 teaspoon soda dissolved in cream, 1 teaspoon vanilla. Mould soft. Bake in a hot oven.

Two cups sugar (some like brown best), 1 cup shortening, 2 teaspoons vanilla extract, 2 eggs. Cream these well together. Add 1 cup buttermilk in which is dissolved 1½ teaspoons soda. Sift together several times. Six cups flour, 1 heaping teaspoon baking powder, ½ teaspoon salt (more if shortening is unsalted). Add some of flour to wet mixture and beat thoroughly, then add remainder of flour. Let stand in mixing bowl 10 or 15 minutes. Have oven hot. Sift sugar instead of flour on board. Partially roll dough, then fold over so as to mix dry sugar all through. Roll and cut only small amount at time. Are very nice with one seeded raisin pressed in center of each.

Subscriber, Modesto

Two cups sugar, 1 cup butter, 4 eggs, 4 cups flour, 3 tablespoons milk, 3 tablespoons baking powder. Rub sugar and butter together thoroughly. Beat eggs separately, add to the above with nutmeg. Sift in the flour and baking powder and knead in enough flour to handle easily.

Mrs. H. E. B., Galt

I am sending a cooky recipe, the one I use most for plain or filled cookies.

One cup sugar, ½ cup shortening, 1 egg, ½ cup sweet milk, 3½ cups flour, 2 teaspoons cream of tartar, 1 teaspoon soda or 3 teaspoons baking powder. Roll quite thin and cut.

With these I sometimes use filling of 1 cup chopped raisins, 1 tablespoon flour, ½ cup sugar, ½ cup cold water. Boil until thick in double boiler. Spread on cookies while hot and place another on top. Bake as plain cookies; it may take a little longer.

(More next week.)

HINTS FROM HOUSEKEEPERS

Separator Rubber

Tell your subscribers that if the separator rubber stretches to be too large to cut out sufficient to make it fit and sew the ends together. This will do as well as a new one.—Mrs. G. C., Bishop.

Recipes for Thompson Seedless Grapes

In answer to request of subscriber for ways of using Thompson Seedless grapes:

Thompson Seedless Sago Pudding.—One cup sago cooked in water, pinch salt, half cup sugar, flavoring. Pick grapes from stem and cook with sugar to taste, adding water to make as much juice as you will want sauce. Stir cooked sago and cooked grapes together, putting grape juice on the fire. Add enough corn starch to make a thin sauce, and a lump of butter. This will serve from six to nine dishes. I use about one and a half cups of sugar.

I also can Thompson Seedless grapes. They taste quite like gooseberries. One quart of grapes with one can of gooseberries added makes good gooseberry pies.—Mrs. A. R. Arnold, Tracy.

Chopped Pickles

Twenty-five pounds green tomatoes, 1 dozen nearly ripe cucumbers, 10 green peppers, 2 large onions. Chop moderately fine, sprinkle with 1 cup coarse salt and let stand over night. Drain off liquid and boil in diluted vinegar (equal parts vinegar and water), letting it boil up well. Drain from this liquid and cook in sweet vinegar, 1 pound sugar to 1 pint vinegar, spiced with cloves and cinnamon. Seal while hot. This quantity will make nine or ten quarts.—Mrs. G. C. Bishop.

Bread Omelet

To one slice dry bread, broken up and made soft with hot water, add one egg, a little butter, salt and pepper. Beat well and pour in skillet, having a little hot grease in it. Turn and brown both sides.—Subscriber, Ball.

Quick Pie Dough

Pie dough is much more quickly made if the grease is melted and water about the same temperature used and both poured into the flour at the same time; use the same amount of grease and water, stir with spoon and roll out and use soon. Just try it and see if it isn't just as good as to rub the grease in cold.—Mrs. C. E. Clark, Lime.

Three Helpful Hints

Don't worry if you happen to burn your bread or cake. Let it stand just a short time to cool, then take your little grater and lightly scrape it off.

The best way I have found to clean nickel.—Wash it with common coal oil and where a cloth will not do use a sink brush and follow up with a soft dry cloth. If there is any shine to it that will bring it out.

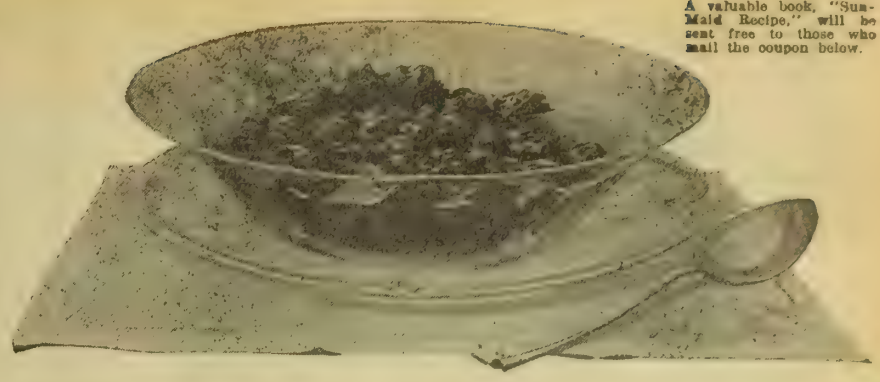
To clean the lime coating that forms in the teakettle boil a big handful of eucalyptus leaves hard for at least an hour, then wash out well. If the first boiling doesn't take it all out repeat. Try covering the spout.—Mrs. H. E. B. Galt.

White Pecan Pralines

Some one asked for recipe for pralines. If not too late I should like to send this one: 1¾ cups sugar, 1 cup maple sugar, ½ cup cream, 2 cups pecan nuts cut in pieces. Boil until first three ingredients reach 239 degrees Fahrenheit. Remove from fire and beat until thick and creamy. Add nuts. Drop from spoon in piles on buttered paper. — Mrs. H. Warren Shepard, National City.

FREE

A valuable book, "Sun-Maid Recipe," will be sent free to those who mail the coupon below.



"A Beauty Sleep"—and then

"A Beauty Breakfast"

Try It for 30 Days—to Prove

This is what thousands do at the direction of experts to win back the healthful rose tint to pale cheeks.

They take regular exercise, sleep regular hours, and then start breakfast with stewed raisins.

The raisins are plump, delicious fruit-meats stewed so the juice forms a luscious sauce. Note recipe printed at left. A more alluring fruit dish never has been served in any home—nor any other food that's more effective in this way.

You'll serve stewed raisins every morning when you know the good they do.

Stewed Raisins

Cover one-half package of Sun-Maid Raisins with cold water and soak over night. In the morning add a slice of lemon or orange. Place on the fire in the same water in which they have been soaked and allow to cook slowly for thirty minutes. Sugar may be added, but it is not necessary, as Sun-Maid Raisins contain natural fruit sugar. Serve with or without cream.

Luscious Nuggets of Food-iron

Raisins are nuggets of food-iron — and food-iron is an essential to good blood.

Get what you need of it each day, and an incomparable, natural rose tint on the cheeks is the reward—nature's irresistible attraction — the good looks of good health. No need to imitate with rouge when nature thus provides.

Youthfulness is the real beauty, as every woman knows. And good blood is the first consideration. Women of fifty often look but thirty if that *natural* rose tint is still there.

Stewed Raisins are mildly laxative also. Those who eat them regularly are apt to have the clear, white skin that sets the color off—unmarred by blemishes or sallowness.

So this simple but effective food is one of the most important that any woman ever used.
Be sure to mail coupon below for "100 Raisin Recipes," a valuable free book that every woman ought to have.

* * * *

Always use Sun-Maid Raisins for your every cooking need. Made from California's tenderest, sweetest, juciest table grapes, noted for their fragile skins.

Packed in a great sun-lighted, glass-walled plant. *Sweet, clean, wholesome American* raisins — the kind you know are *good.*

Three varieties: Sun-Maid Seeded (seeds removed); Sun-Maid Seedless (grown without seeds); Sun-Maid Clusters (on the stem). All dealers. Insist upon the Sun-Maid Brand.

Send for free book, "Sun-Maid Recipes," describing scores of ways to use.

SUN-MAID RAISINS

Sir Aaggie DeKol Mead

Bred in the richest Aaggie Acme-De Kol of Valley Mead cross, he should be one of the greatest young sires of the breed.

Five of his seven nearest dams average:

Butter	2 Years	2,040.97 Pounds
Milk	2 Years	41,547.20 Pounds
Butter	1 Year	1,130.66 Pounds
Milk	1 Year	23,096.60 Pounds

His seven nearest dams average:

Butter	7 Days	30.47 Pounds
Milk	7 Days	627.60 Pounds

His calves are just what we could expect from a long succession of great sires and dams, and in their present state of development fulfill every promise in the pedigree of their great sire.

Good business judgment will eventually prompt you to place at the head of your herd a bull of Aaggie Acme-De Kol of Valley Mead breeding.

OWNED JOINTLY BY

Fred Hartsook and A.W. Morris & Sons Corporation

LANKERSHIM, CALIF. WOODLAND, CALIF.

Show Bull at a Bargain

Born Dec. 10, 1920

A young bull that combines the great qualities of Sir Pietertje Ormsby Mercedes and King Segis Pontiac.

TYPE PLUS PRODUCTION

Sire — Tritomia Pietertje Ormsby, a line bred son of Sir Pietertje Ormsby Mercedes and out of Alice Tritomia Ormsby, who made 34.43 lbs. butter in 7 days and 1,048.6 lbs. from 24.287 lbs. of milk in a year. This bull carries 62½ per cent of the blood of Sir Pietertje.

Dam—K. S. P. Queen Burke, a daughter of King Segis Pontiac. Her record is 31.12 lbs. of butter from 584.3 lbs. of milk in 7 days at 4½ years of age. His seven nearest dams average 31.3 lbs.

Tuberculin tested and guaranteed in every way.

MAXWELL FARMS

Near Universal City R.F.D., Hollywood, Cal.

HOLSTEIN Fred Hartsook RANCH CATTLE

We have assembled an excellent foundation herd of females and will be glad to have breeders call. Fred Hartsook, Lankershim, California.

Sir Aaggie Hiske Walker

SHOW TYPE and PRODUCTION

He was first in two year class at Riverside last year.
His dam is a 34 lb. daughter of Prince Gelsche Walker.
His sire is the 36 lb. Morris bull—Sir Aaggie De Kol Acme.
A limited number of approved cows will be accepted for service.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

October 4, S. O. Walker, Visalia.
October 5, Robt. T. Curtis and Son, Tulare.
October 6, Alex Whaley, Tulare.
October 21, Robt. N. Clapp, Nuevo.
November 3, A. W. Morris & Sons, Inc., Woodland.
November 9, Palo Alto Stock Farm, Palo Alto.

Herefords

October 27, Pacific Coast Hereford Breeders' Association, California National Livestock Show, San Francisco.
November 1, J. H. Cazier and Sons, Sacramento.

Shorthorns

October 28, California Shorthorn Breeders' Association, California National Livestock Show, San Francisco.
November 2, W. M. Carruthers, Live Oak.

Two noteworthy 305 day records have recently been completed in the herd of registered Holsteins owned by M. J. and B. A. Edwards, Ripon. The nine year old cow Sarcastic Dora of Millbrae made in 305 days 860 pounds butter from 20,836 pounds milk, was never milked more than three times per day and cared for under ordinary herd conditions. She is sired by Sarcastic Legislator, a grandson of Sarcastic Lad, the grand champion bull at the St. Louis Exposition. Squaw Queen De Kol 2nd, also a mature age cow, made 665.61 pounds butter from 16,031.6 pounds milk in 305 days.

Adirondac Wietske Dairy Maid, the famous 41 pound cow owned by Bridgford Holstein Company, Patterson, is making another wonderful yearly record. In the first 100 days on test she has to her credit 11,025 pounds of milk, several hundred pounds ahead of her last year's record, and is still milking over 100 pounds per day. In the same herd Ormsby Mechthilde Prilly, a junior three year old daughter of the three times grand champion King Segis Alcartra Prilly, tested during a hot spell, made 26.71 pounds butter from 497.6 pounds milk in seven days and is now milking over 80 pounds per day. Louise Alcartra Prilly, also a daughter of the Prilly bull, has now been on yearly test eight months and has to her credit 17,993 pounds milk and is still milking 65 pounds per day. Another daughter of the same bull, Bessie Veeman Alcartra, has to her credit 16,261 pounds milk in seven months as a senior two year old and is now milking over 75 pounds per day. Both of these heifers promise to finish with right up around 24,000 pounds milk, which will place them right close to the top in their respective classes.

J. M. Christen, Martinez, a pioneer breder of registered Holsteins in Contra Costa County, will make his initial appearance at the California state fair this year with a few head of young things.

Tuesday, October 4, is the date set for the dispersal at public sale of the herd of registered Holsteins owned by S. O. Walker, Visalia. The herd numbers approximately 65 head, including the famous bull King of the Black and Whites and about 30 of his daughters.

The sale of about 45 registered Holsteins from the good herd of Robt. T. Curtis & Son, Exeter, will be held on Wednesday, October 5, at the Tulare Sale Pavilion, Tulare. Several splendid young daughters of the $12,000 bull King Korndyke Pontiac 20th and the noted 34 pound four year old Coloma Beauty Butter Maid will be included in the sale list.

The series of Holstein sales in Tulare County will be rounded out by the dispersal of Alex Whaley's choice herd at Tulare on Thursday, October 6. The high quality of this herd has become well known through the excellent official records made by its members, the uniformly high class representation it has afforded in some of the best public sales, and the succession of high record and popularly bred herd sires used over a period of years.

A. W. Morris & Sons Corporation, Woodland, will make a public sale offering of registered Holsteins on Thursday, November 3. The number to be sold has not yet been definitely fixed, but the event promises the most sensational offering ever made by the Morris firm in an individual sale.

Robt. N. Clapp, proprietor of Sycamore Acres, Nuevo, announces a public sale of approximately 70 head of registered Holsteins from his high class herd on Friday, October 21. This herd is rated as one of the strongest in the country in the blood of King Segis and contains a number of nationally famous show ring winners.

On Wednesday, November 9, the first public sale of registered Holsteins from the Palo Alto Stock Farm, Palo Alto, will be made on the farm. This herd, owned by the well known banker Herbert Fleishhacker, San Francisco, has increased in size until it is one of the three largest in California, and under the management of E. N. Brown is shaping to become a large factor in the breed's affairs in California.

Sharon Rose Novena, the first cow sold in the Rosemaines Rancho dispersal at Riverside last October, has recently freshened and on official test has over 31 pounds butter to her credit in seven days. She is now owned by Robt. N. Clapp, Nuevo.

Nevada will compete with California and other coast states for the premier honors in the Hereford and Shorthorn classes at the state fair at Sacramento in September. The well known Nevada Hereford Ranch at Wells, owned by J. H. Cazier and Sons Company, has entered 17 head, a number of whom are by the famous young herd bull, Beau Blanchard 76th, for which they paid $10,000 as a yearling calf. He has won prizes at some of the big shows in the East. The Warm Creek Land and Livestock Company, also of Wells, Nevada, has entered 15 Shorthorns in the state fair competition.

The Virden Packing Company will offer three handsome trophies in as many livestock classes at the 1921 California state fair. The trophies will be given to the best car lot of swine, best car lot of steers and to the best single steer.

Plans for a goat exhibit to eclipse anything yet offered in California are being made for this year's state fair. A movement, fostered by Miss Alice M. Brown of Sacramento, has resulted in assurance that many Southern California breeders will enter their herds in the competition.

The Central California Milk Goat Breeders Association is urging its members to cooperate with the state fair officials in making this phase of the fair a success. A meeting of all breeders, under auspices of the association, is to be held at the fair on September 7.

For the second time in the history of the California state fair hogs from the Middle West will be shown in competition with coast bred swine. Fair officials point to the fact that this is an indication that breeders have come to recognize the fact that the state fair is a prominent and profitable place to exhibit their best animals. It also proves that the state fair has assumed national importance.

Whittier, Calif.,
July 30, 1921.

California Cultivator,
115 N. Broadway,
Los Angeles, Calif.
Dear Sirs:

Some few days ago we received the beautiful silver cup you had H. P. Davidson, jewler, send us. The cup certainly is a dandy, and we are proud to be the winner of such a fine prize. It is no wonder that all the dairymen are trying to win the Cultivator monthly prizes. We are doing our best to get another cup before the end of the competition.

We are now having the cup engraved and later will mail you a photo for your files.

We wish to thank you for the fine cup and hope to have the privilege of thanking you again soon for that other cup we may win.

Very truly yours,
F. F. Pellissier,
By Frank L. Pellissier.

SOUTHERN CALIFORNIA FAIR

Livestock men are getting solidly behind the management of the Southern California Fair to be held at Riverside, October 11 to 16. They recently held a meeting in Riverside, and from the canvass made at that time we are promised one great exhibition of California's livestock industry. Secretary Van Pelt writes:

"The National Duroc-Jersey Record Association futurity, the Poland-China Promotion Show, a special futurity of the American Berkshire Association and a special of the American Hampshire Swine Association have all been filled, which assures much enthusiasm in the ranks of the various breeders.

"In the junior department there are uniform classifications for each breed, with liberal prize offerings. The interest in this department far exceeds that of any previous year and reflects the increased interest which the boys and girls under the guidance of the far seeing leaders in agricultural education, are taking in handling pure bred animals. Spirited contests will be held in feeding, fitting and showing, and judging. The last named contest is of state wide scope and evidences much interest. In addition to these the state and national associations of each breed have offered specials of five prizes each for boars and gilts.

"The agricultural tent, the largest ever seen in California, will be greater and more pretentious this fall, as numerous features have been proposed."

CALIFORNIA NATIONAL LIVESTOCK SHOW

The California National Livestock Show, to be held on 12th and Market Streets, San Francisco, October 22 to 30, will require 330,000 square feet of canvas to house a modern stock ranch transferred from the range to the heart of San Francisco. More than a thousand entries are expected. The great show held two years ago in the California Building on the Marina sold itself in every way to the 50,000 people who paid their admission. This year's show will be greater and more accessible in every way. A tent 520 feet long will be required to take care of the cattle entries alone. Stock from many states will be in place on the opening date. One great entry of cattle is expected from as far east as Ohio, and all the western stock states will be represented.

DAIRY INDUSTRY IN NEW ZEALAND EXPANDING

The output of butter and cheese in New Zealand has increased nearly tenfold in the last 20 years. According to the London Dairy Journal, one of the factors responsible for the success of the dairy industry there is the warm and equable climate which makes it unnecessary to house stock during the winter months.

The total number of cattle in New Zealand in 1919 was 3,035,478, of which 863,588 were dairy cattle. There were 214 butter factories in 1919, with 24,789 suppliers, and 384 cheese factories with 10,026 suppliers. During the 1918-19 season 406,050 hundredweight (112 pounds) of butter and 1,147,780 hundredweight of cheese were exported. The local consumption of butter is estimated to be 20 pounds per capita. Nearly every household can afford to use butter throughout the year. Margarine is practically unknown in the Dominion.

VALUE OF LIVESTOCK SHOWS GREAT INCREASE IN DECADE

(Continued from Cover Page)

comparison since they relate in each case to the production of a calendar year. The egg production given above includes estimates for farms which reported chickens on hand but no eggs produced. The number of chickens raised in 1919 was 473,923,935, as compared with 460,605,709 in 1909. This represents an increase of 13,318,226, or 2.9 per cent. Chickens raised do not include those hatched and sold as baby chicks, but do include baby chicks purchased and raised, as well as all other chicks hatched and raised, even though they may have been consumed or sold before the end of the year.

Built for the Belt

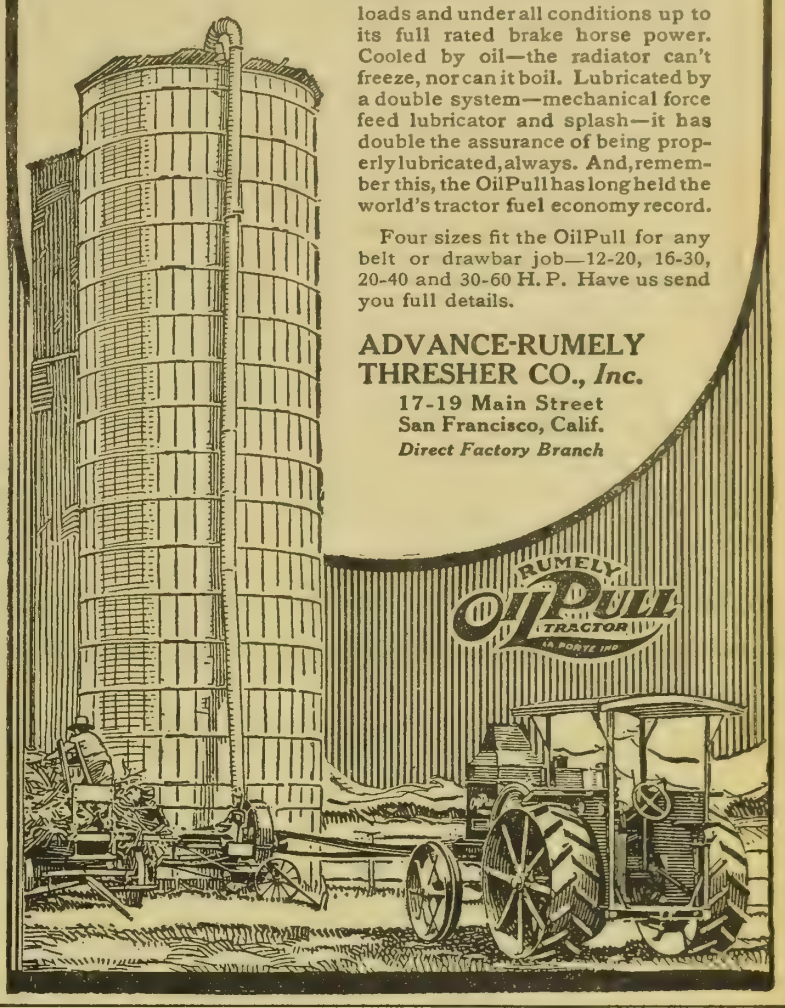
The Rumely OilPull tractor is especially suited for belt work.

The belt pulley is unusually large, is driven directly off the crankshaft with no bevel or intermediate gears and is placed on the right-hand side, well up, so that the operator has a clear view and can line up, start and stop the pulley from the seat.

The speed regulation of the OilPull is close—as close as the best steam engine ever built. It is governor controlled—the speed of the engine automatically and instantaneously regulated to meet every change in the load. It automatically holds the belt at the correct speed all day—no speeding up or slowing down as the load varies.

It has a shifting front axle—plenty of belt clearance, with no sacrifice of design or construction.

In fact, it is fully as well adapted for belt work as for drawbar work.



Guaranteed to burn kerosene at all loads and under all conditions up to its full rated brake horse power. Cooled by oil—the radiator can't freeze, nor can it boil. Lubricated by a double system—mechanical force feed lubricator and splash—it has double the assurance of being properly lubricated, always. And, remember this, the OilPull has long held the world's tractor fuel economy record.

Four sizes fit the OilPull for any belt or drawbar job—12-20, 16-30, 20-40 and 30-60 H. P. Have us send you full details.

Let the SUN give you plenty of HOT WATER

DAY & NIGHT

SEEMS impossible, doesn't it: But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home—mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept. E.

AUCTION

160 Head Dairy Cows and Heifers 160

3 Holstein Bulls 7 Horses Implements

At our Dairy, known as the Big Four Ranch, 30 miles west of Fresno, 18 miles east of San Joaquin, 12 miles west of Carruthers, 2 miles north and 2 miles west of

Burrell, Fresno County

Wednesday, August 17th, at 9 a.m.

The owners are closing out their splendid dairy herd and all equipment on above date, POSITIVELY WITHOUT LIMIT OR RESERVE. Including 120 head of choice, young, well bred dairy cows, nearly all Holsteins, a few extra good Durhams, all in fine condition, 40 head being strictly fresh and milking heavy and 40 head of heavy springers. The owners have raised a large number of these cows and bought nothing but the best from other herds. These cows are bred to come in when butter fat is at the best price. There are 25 head of 2½ to 3 year old Holstein heifers, all heavy springers, coming in with their first calf. Fifteen head of yearling Holstein heifers. One pure bred Holstein bull 3 years old and 2 other high grade Holstein bulls. This is a wonderful herd of dairy cattle and buyers looking for cattle above the average will not be disappointed in the herd.

Seven head of good ranch stock, young and clean. New Fordson tractor, used only 25 days; 200 TONS of ALFALFA HAY.

IMPLEMENTS

No. 22 De Laval separator and engine, 2 Aermotor engines, 3 flat rack wagons, double work harness, 2 McCormick mowers, Adriance rake, hay derrick, walking plow, Oliver sulky plow, all dairy equipment and other implements. CHEVROLET AUTO and new trailer.

Bred Guernsey Heifers and Cows

Guaranteed Safe in Calf to

Masterpiece of Edgemoor

The Greatest of All Guernsey Bulls—For Which

$40,000 Has Been Refused

Masterpiece was sired by Royal Rose King of Edgemoor who was by Imp. Itchen May King, grand champion of the P. P. I. E. in 1915 and grand champion National Dairy Show in 1920. Royal Rose King of Edgemoor was out of Belladia who made 934 lbs. of butter fat in 365 days in the certified milking barn.

Masterpiece is out of Jessebel of Edgemoor whose record of 12,434.9 lbs. of milk and 748.3 lbs. of butter fat at two years of age makes her the best daughter of the great Ne Plus Ultra.

Masterpiece combines great show-type with high production.

The females we offer for sale run high in the popular May Rose blood and Masterpiece combines all of the great May Rose blood lines.

The heifers are from good A. R. dams and will make excellent records. We are offering Californians a chance to get Guernsey females that cannot be duplicated and the price is right.

All animals tuberculin tested and guaranteed clean. Call or write at once.

Farm is on Washington Blvd. 2 miles east of Venice. Santa Monica

RECORDS AS A BASIS FOR DAIRY CATTLE VALUES

(Continued from Page 149.)

cattle breeders have come to estimate cattle values on the basis of breeding and production, the man engaged in the business of producing cattle is standing in his own light if he fails to value such records when purchasing or developing a herd.

The principal criticism offered against a general practice of official testing is the cost of preparing cattle for test, the added labor and the cost of supervision. It is true that it costs money to give cattle an official test but with the growing demand from purchasers for tested cattle and the discrimination being manifested between cattle with extensive backing and those with lesser backing the question of official testing looms large before California dairymen.

To more definitely demonstrate the value of tested cattle as compared with untested cattle, the writer, through the courtesy of C. L. Hughes of the California Breeders Sales and Pedigree Co., examined the sale reports of 12 Holstein sales held in the state the first six months of 1921. These sales included between 900 and 1,000 Holstein females ranging in ages from calves but a few days old to cows over ten years. Some sold without the benefit of a tuberculin test and some went through the ring as known reactors—the great majority, however, were tuberculin tested. On the whole, however, the cattle sold can be regarded as a representative lot and the prices paid can be considered equally representative. For the purpose of this article, the cattle were listed by ages and each age was grouped for production records as follows: Untested, seven day records of 20 pounds or less, 20 to 24 pounds, 25 to 29 pounds and 30 pounds or over. The bred and unbred heifers were grouped according to the production records of their dams.

Table I

Records	No.	Average Price
Two Year Olds in Milk		
Untested	44	$ 270.90
20 lbs. or less	12	543.75
20-24 lbs.	3	933.33
Three Year Olds		
Untested	77	$ 325.17
20 lbs. or less	30	468.00
20-24 lbs.	6	1320.00
25-29 lbs.	8	738.75
30 lbs. or over	1	1200.00
Four Year Olds		
Untested	39	$ 347.78
20 lbs. or less	19	538.68
20-24 lbs.	15	550.00
24-29 lbs.	4	570.00
30 lbs. or over	1	800.00
Five Year Olds		
Untested	32	$ 272.13
20 lbs. or less	17	373.52
20-24 lbs.	11	482.72
24-29 lbs.	7	796.42
30 lbs. or over	----	.....
Six Year Olds		
Untested	35	$ 340.86
20 lbs. or less	7	387.14
20-24 lbs.	23	496.95
24-29 lbs.	7	572.14
30 lbs. or over	2	1462.50
Seven Year Olds		
Untested	9	$ 511.00
20 lbs. or less	12	299.58
20-24 lbs.	3	650.00
24-29 lbs.	18	1295.00
30 lbs. or over	2	1500.00
Eight Years and Older		
Untested	19	$ 221.00
20 lbs. or less	16	283.12
20-24 lbs.	19	333.94
24-29 lbs.	13	460.38
30 lbs. or over	5	843.00

255 untested cows 2-8 years old averaged $310.33.

300 tested cows 2-8 years old averaged $504.11.

From the above table several interesting conclusions can be drawn and we urge a careful study of the facts disclosed therein. It will be noticed that in each divisional group the tested females sold for more money than untested females, with the exception of the untested seven year olds. The reason for the $511 average on the nine head listed is due to the fact that one cow sold for $2,000. In explanation of that price it can be said that this particular cow was one of a group of sisters, all of which, save herself, had been given splendid records and as she was one of the best individuals of the group it was assumed that she was capable of making a fine record if given the opportunity.

In the case of the two year olds the official record of 20 pounds or less doubled their value, and the few with records above 20 pounds had their values increased several fold. Forty-four untested two year olds averaged $270.90 and 15 tested two year olds averaged $621.66. With the three year olds the 77 untested ones averaged $325.17 and the 45 with records averaged $646.11. Almost the same proportionate values hold for the four year olds, with the untested stuff making $347.78 while 39 with official records averaged $553.71. Practically $220 a head was added to the value of the tested five year olds as compared with the ones of like age not having records. With the six year olds the difference amounted to $200 per head and with seven year olds practically $400 difference is disclosed. The comparatively low average for untested aged cows can be explained by the fact that buyers are shy of making heavy investments in cows that have reached considerable age without a record.

In general the above figures would seem to indicate that at present charges a record will on the average pay for itself—and more, depending upon the number of cows carried on test at the same time—it being explained that the overhead can be reduced in proportion to the number of cows tested. But the real value of giving a cow a record is not, on the average, the increase to her as an individual, but rather the increased value the offspring from tested cows have over offspring from untested dams—and it should be borne in mind that this added value remains in force as long as the dam continues to produce.

Table II has been prepared to throw some light on the value of a tested dam's produce over the produce from untested dams.

Table II

Open Heifers*

Production of Dams	No.	Average Price
Untested	81	$225.37
20 lbs. or less	52	275.25
20-24 lbs.	48	296.25
25-29 lbs.	26	378.45
30 lbs. or over	10	547.50
Bred Heifers		
Untested	46	$275.00
20 lbs. or less	39	413.59
20-24 lbs.	31	417.09
25-29 lbs.	22	548.40
30 lbs. or over	9	799.44

*Includes calves from a week old up.

From the above table it is plain that buyers are demanding young things from proven ancestry and that they are willing to pay liberal prices for breeding with records. In the case of open heifers, those from untested dams averaged $225.37 and 136 head from dams with records averaged $322.42—more than $100 difference. The 46 bred heifers from untested dams were valued at $275 per head and 101 from tested dams averaged $478.41—more than $200 difference.

In considering the above figures it should be borne in mind that the increased values noted can be regarded as additional to the added value a record may give the dam, and that it is fair to assume that such increase will continue to be recorded for the female offspring over a period of years.

There is another angle relating to the value of official records in a herd that has been demonstrated in a number of dispersal sales the past year. Generally, within a herd one or two herd bulls have seen extensive service and at the time of dispersal are represented by daughters of varying ages. If a number of the older daughters have been tested, such fact invariably adds to and helps the sale of their younger sisters that have not reached the age of testing.

IMPERIAL COUNTY COWS TESTED IN JUNE

Tester D. W. Adams reports:
June brings a slightly decreased average of butterfat per cow under that of last month. The excessive heat is undoubtedly the chief cause. Also many of the dairymen figure to have a large part of their cows dry at this time.

Some grain and concentrates are being fed. Mr. Griffin, whose herd tops the list this month, is getting good results with "cold press" cotton seed. This feed is identical with the whole cotton seed except that the oil, which is somewhat injurious to stock in hot weather, is extracted.

Warne & Son are keeping up their heavy milk average by feeding fresh beets.

As usual this month there have been several "star boarders" that have lost their happy homes and served a more useful end.

470 cows tested.

731.7 pounds milk average per cow for month.

28.9 pounds butterfat average per cow for month.

3.9 per cent test average per cow for month.

41 cows produced above 40 pounds fat for the month.

SAN JOAQUIN COWS ON TEST

Geo. Wolf, cow tester for the dairy department of the San Joaquin County farm bureau, reports for the month of June 486 cows tested for 17 members. Of this number 57 made 40 pounds butterfat or better during the month. Four produced over 60 pounds fat. These were Lady Washington, a Holstein belonging to Fottrell Bros., who gave 80.9 pounds fat during the month; Low, grade Holstein, belonging to F. M. Thorpe, Ripon, 67.1 pounds fat; No. 508, Jersey, belonging to N. H. Lock, Lockeford, 66.1 pounds fat; Buster, grade Holstein belonging to Bert Eskes, Ripon, 60.7 pounds fat.

Mr. Wolff writes:

"Of considerable interest to dairymen would be the record completed by the pure bred Holstein cow Blaney Pondyke Aralia, owned by E. B. Goodwin of Manteca. During the ten months of test she has produced 13,685 pounds of milk and 436 pounds of fat, which is equal to 545 pounds of butter. Not only is this a creditable showing but also a persistent record, for during the last month of lactation, milked only once a day, she produced 33 pounds of fat. At the present time she is heavy in calf sired by one of the good sons of Prince Gelsche Walker.

It is not always the pure bred cow carrying off the laurels. The grade Holstein cow Jumbo, owned by G. A. Grant of Ripon, just completed the ten month record with 12,143 pounds milk, producing 500.2 pounds butterfat, which is equivalent to 625.3 pounds of butter. Her average per cent test was 4.1 per cent. Without computing the number of miles a cow of 625.3 pound packages of butter would cover if set end to end or the number of tanks it would take to convey 12,143 pounds of milk, or the number of people this would feed, I can say that the grade cow Jumbo has produced more than her own weight of milk each month, and has averaged a little better than two pounds of butter daily, considering the fact that Jumbo carried a calf seven and a half months during the ten months on test.

Two of Jumbo's stable mates are also in the race for laurels. The grade Holstein cow, Jane, just completed a ten months record with 8,826 pounds of milk, producing 527.3 pounds of butter, and the grade Holstein cow Beauty produced 8,065 pounds milk and 420.9 pounds butter in ten months, carrying a calf seven and a half months.

Let me draw your attention to the fact that the three cows above mentioned received only ordinary care and food, and were milked but twice a day; but last, but not least, is that they have for a sire a pure bred bull.

The Holstein breeders of California should find cause for satisfaction with the condition of their business from the figures of their public sales for the first six months of 1921. Their sales through California Breeders Sales and Pedigree Co. show a total of 1,057 head sold for an average of over $385, which may be taken as a fair average worth of all registered Holsteins in the state, as many of these sales were dispersal sales which included old and defective cows, and a large number of very young calves, both bulls and heifers. The prices ranged from $9,250 down to $25, but with very few calves selling under $100.

Bourbon Red Turkeys, Buff Orpingtons. The Ferris Ranch, Reservoir Street, Pomona, California.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Legal Citizen

What constitutes a legal citizen in the state of California? Does the fact that he has not registered and does not vote make him a citizen in the state he came from? — Subscriber, Pasadena.

There seems to be no clear definition of just who is a citizen of any particular state. Under the rule in the United States, all persons other than residents of the District of Columbia are citizens of two governments, one state and the other national, and each one owes his allegiance to both of these governments within their respective spheres. A person may be a citizen of the United States and not a citizen of any particular state, as residents of the District of Columbia or territories of United States or those who reside abroad. So a person may be a citizen of a particular state and not a citizen of the United States, as in the instances of aliens who have declared their intention to become citizens and by local law are entitled to vote, but by reason of their naturalization not being completed, are not citizens of the United States. A person is to be regarded a citizen of his native state until it can be shown that he has acquired citizenship elsewhere, and this is purely a matter of fact, resulting from both act and intent. The intention to become a citizen and resident of a state other than that of his nativity must be shown, and united with this intent must be the actual act of removing to the state. Thus, if this actual act and intent were shown, a person might become a citizen of such alien state even prior to the time required for residence in order to entitle him to vote therein. Registration as a voter would add materially to the status of citizenship.

Contract—Oil Boring

I bought a piece of land on contract, in which a clause states that I cannot bore for oil. I now hear that there is oil in the vicinity. What right would I have to lease the land for oil purposes?—Subscriber, San Gabriel.

It would depend entirely on the exact terms of the contract. In some of these contracts the provision is probably void. In others, it would give action for personal damages for breach and it might cause a forfeiture of title.

Estate to Charity

Can a bachelor leave all of his estate to charity in this state?—Subscriber, Pasadena.

The provision of the code in respect to such bequests is substantially as follows: No estate shall be bequeathed to any charitable use, unless by will executed at least 30 days before decease, and no devize shall exceed one-third of the estate of the testator who leaves legal heirs. There is an exception to these provisions, however, in favor of devizes for the use of the state, any state institution, or any educational institution exempt from taxation. The section restraining bequests or devizes shall not apply where the will is executed at least six months prior to death of the testator and the testator leaves no parent, husband, wife, child, or grandchild, or when all of such heirs by writing, executed at least six months prior to the death of the testator, have waived the restrictions contained.

You cannot tell when the road may open and you should be prepared to step along.—So. Pac. Bulletin.

Forethought is a fine and necessary thing. Fearthought is unnecessary and one of the worst destroyers of happiness in the world.

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Refuses Service

We have a seven year old cow with fourth calf in our herd who is almost continually in heat but refuses service. What should be done to remedy this condition?—Subscriber, Bonsall.

I would suggest that you use a breeding crate in this case so that the cow could not refuse service. If a breeding crate is not handy one can be improvised quite easily in a corner of a corral with the use of two or three 2 by 4's. If this does not remedy the trouble I would suggest that you consult a veterinarian who could make an examination and could no doubt suggest treatment to clear up this difficulty.—G. E. G.

Canada Thistle

Information for Oregon subscriber in regard to Canada thistle:

Well, to begin with, I fought the Canada thistle for years in Minnesota for whenever you cut off and cleared they would come up all over the clearing, and of course we planted corn and cultivated and hoed, and the more we worked the better they throve. But the time came when we found a plan that was successful, and that was to plow in August when the sign is in the heart—which is only two days. At that time I had 14 acres where they stood as high as the grain. I called on my neighbors after cutting the grain with self binder and hauling the grain off, and we plowed the piece in one day—sign in the heart in August—and the result was when sowed the next year, only just now and then a thistle showed where there was a stump, and from the time that was done and for years the whole neighborhood practiced that and got rid of 100 acres of the pest. If you have a small patch you can kill by cutting.—Reader, Folsom.

(If the sign happens to be in the heart the first day the thistles are observed, we believe excellent results will be obtained by vigorous and instant action, but we trust none of our subscribers will delay unduly for signs of the zodiac or any particular phase of the moon.—Edit.)

Old Mine Stock

In 1864 my father bought shares in the Open Sesame California Consolidated Gold, Silver and Copper Mining Company of San Francisco, also some in the Union Mining Company, Were these companies prosperous? Do they still exist? I still have the certificates of shares. Are they of any value?—Subscriber.

Do any of our subscribers know of activities of these companies so that they can give information to this inquirer?

Dog Kills Chicks

I have a young dog six or seven months old that kills my young chicks and eats eggs. What can I do to teach him to leave eggs and chicks alone?—Subscriber, Fresno.

We find it extremely difficult to correct the puppy's habits. If he is valuable he will be worth the effort, however, and so far as the chicks are concerned we know of no way other than severe punishment at his first effort. As to the eggs, however, the habit has sometimes been corrected by blowing and filling the shell with cayenne pepper. It may be left in the nest and the puppy given his own way with it or, if he refuses to break the shell, it may be crushed in his mouth. This gives him such a hot dose that he will not care to repeat. We will be glad to hear from subscribers who have trained dogs in this particular.

Curing Sudan Hay

Please give information as to curing Sudan?—Subscriber.

H. L. Musser answers: "When in Texas the writer saw large fields of it being cut for hay. The time of cutting was when the seed heads were well formed but the seed was yet in the milk. This is the time to get the maximum of production as well as the best quality. It looks like very coarse straw in the bale and quite brown but evidently very palatable because the stock, both cattle and horses, apparently ate it with great relish. The method of cutting was with the ordinary McCormick reaper. It could be more conveniently handled with a binder but a large percentage of it would mould. It might be practical to cut it younger but the quality of the hay would not be so good."

Built to an ideal and not to a price

The great quality limitation of the average pump is its price. Before the first casting is made its life usefulness is pre-determined by *price*.

Byron Jackson has become synonymous with quality because it has been the policy of this Company through the years to reverse this procedure.

Every pump, whether special or standard, is built to the ideals of quality, efficiency, dependability and economy. Then, and only then, is price computed.

Tools of Industry

In industry, art, science, in fact in all kinds of work, good results require good implements kept in good condition.

If the right sort of implement is important to an individual workman, efficient tools for industry and commerce are a vital necessity to the nation.

Telephone service is one of the tools of American industry and commerce in most common use and upon which much depends. The American public cannot afford to let this tool get dull.

To provide over twelve million subscribers with telephone connection; to transmit the vibrations of the human voice thirty million times a day and from any point to any other point throughout the land, demands an expensive mechanism of the highest order of scientific precision, and an efficient organization.

It is the aim of the Bell Telephone System, with the cooperation of the public, to be the most dependable tool of American industry.

Control of Squash Bug

Noting inquiry from Oceanside subscriber as to means of controlling the spotted squash bug, the California Sprayer Company writes: "In a recent issue of the Cultivator, questions and answers column, a subscriber from Oceanside writes for information on the control of the 'spotted squash bug,' undoubtedly referring to the beetle known to entomologists as the 12 spotted cucumber beetle. In reply the subscriber is advised to use 'Paris green or other arsenical poison,' and a wet spray is recommended without mention of the much quicker and probably more effective method of dry poisoning with arsenicals or the nicotine dusts which the U. S. department of agriculture recommends. Roy Campbell of the Alhambra laboratory in his Circular 154 of the U. S. department of agriculture states that in dusting with a 10 per cent nicotine sulphate dust with hand operated bellows duster one puff of the dust was all that was needed for a single hill of melons. He says 'the effect was immediate. When struck with the dust many of the beetles were unable to fly away but crawled on the ground under the plants in apparent distress, and in a few minutes succumbed. Some which were able to fly away, on being followed, were found to go only a short distance, and in a very short time were overcome.' In severe cases, such as your subscriber reports, 10 per cent of arsenate of lead powder with a 10 per cent nicotine dust might be advisable. We believe, however, that no remedy known at present can compare with the nicotine dust treatment recommended by the department of agriculture for the same beetle on melons. It is now generally conceded by investigators that where equally effective insecticides or fungicides are known, the dry applications are more easily made, more quickly made, and more thoroughly made."

Government Land

Can a married woman take up government land by homesteading or any other way? Where can I get information regarding government lands in the vicinity of Victorville, San Bernardino County?—A. B. C.

A married woman may not make homestead entry unless she has been deserted by her husband or he has been incapacitated by disease or otherwise from earning support for his family, or is confined in the penitentiary. She may, however, make desert entry even if her husband is living and has made desert entry himself. Write Land Office, Department of Interior, Washington, D. C., and ask for "Suggestions to Homesteaders," also copy of "Statutes and Regulations Governing Entries and Proof Under the Desert Land Laws." Or presumably these books may be had of the local land offices. As to securing lands in the vicinity of Victorville the only way of determining is to make personal inspection or employ one qualified, then secure information through the land office at Los Angeles as to whether other entry has been made. If not, then blanks will be supplied by the land office.

Killing Flies

Do you know of anything that would be practical to spray on flies to kill them when they come in to roost on the roof of the cow shed on cool evenings? I could exterminate most of the flies around the cow shed if I could get them then. I remove all manure once a month, but they breed fast.—Subscriber, Orange.

The best control in a case like this is thorough cleanliness and distribution of the manure at intervals of four days or less. Where manure is exposed in a moist condition for four days or more it allows hatching and transformation of the flies. The use of borax, liberal quantities of kerosene and, in fact, quite a number of chemicals, will control this hatching of the flies, but this is not only expensive but most of the agents lessen the value of the fertilizer. Where it is impossible to distribute manure every day or two then insect tight bins for storing it answer the purpose. As to spraying the flies on the roof, kerosene emulsion or probably straight kerosene will accomplish this result.

Poultry Queries

(Conducted by Jean A. Koethen.)

Umbrella Trees Poisonous?

Are umbrella trees poisonous to poultry?—Subscriber, Fallbrook.

I have never heard of it. If they are I feel very sure chickens will let them alone. I have kept poultry for years right among castor bean plants, which are considered poisonous, with how much reason I cannot say, for I never knew a chicken to touch one.

Sprouting Barley

How long should whole barley be sprouted before it is fed, and how much should be fed daily to half grown and full grown pullets?—Subscriber, Orland.

Barley is usually sprouted about five days. Soak it from 12 to 24 hours, then pour into a box or tray with holes in the bottom to permit the water to drain off. Set in a shady place, cover with burlap, and, if the weather is very hot or dry, wet daily. When the little white sprouts begin to show it is ready to feed. If you leave it till the green tops show some of its food value will be lost. Feed once a day all the birds will clean up quickly, say in 15 or 20 minutes, to any size of fowl. The older the bird, the more it will eat.

Mysterious Deaths

Within the last month I have lost four apparently healthy February pullets. They seem to have fever, breathe very rapidly, and die in a short time. They have a mash consisting of bran, about one-third laying mash, charcoal and a very little bone meal. This is before them constantly. Their scratch consists of cracked corn, wheat and milo night and morning. Their green feed is chopped alfalfa.—Subscriber, Del Rosa.

It is hard to diagnose from so meager a description of symptoms, but I should be suspicious of the cracked corn. Either they are getting too much heating food, since you are using both corn and milo, or else the corn has been heated and contains mold spores. In any case it would be well to drop the corn for a while and perhaps the milo also. Change to wheat and barley for a while and do not feed more than a quart daily to 15 birds.

WILL HANDLE POULTRY

Recent statement of the Poultry Producers of Central California announces that "at the meeting of the board of directors on July 26 plans for the handling of poultry by the association next season were actively discussed. These plans contemplate the largest and most complete poultry packing plant on the Pacific Coast, if not in the entire United States. Now that our increased capital is assured, we are able to go ahead definitely with these plans, and the entire matter of building and equipping our poultry packing plant at Petaluma has been referred to the executive committee with power to act."

As to marketing conditions the report says:

"Egg production in the East and Middle West has also fallen off with the advance of the summer season, and the natural decline in production has been greater than usual because the hens began to lay earlier this year. This has caused a corresponding decline in the storage receipts so that the quantity of eggs in storage at the four big eastern markets (New York, Chicago, Boston and Philadelphia) on July 16 was only about nine per cent more than at the same date last year, and about ten per cent less than in 1919.

"All this verifies the expectations of experienced poultrymen who felt sure that the early commencement of laying this year must necessarily mean an early decline in production.

"Continued hot weather in the East has seriously affected the quality of the eggs produced in that territory, causing a shortage of stock of good quality and a consequent advance in the market for Pacific Coast eggs in New York, as anticipated in our last monthly letter.

"The shortage of good eggs in the East has also started a demand for storage eggs of fine quality. We have sold several cars of storage eggs lately for eastern consumption."

PETALUMA EGG DAY

Petaluma, the "World's Egg Basket." will celebrate its fourth annual Egg Day, August 20, for the purpose of demonstrating the real food value and economy of eating eggs and why people should eat more of them. "And by means of this annual fiesta we will demonstrate the necessity for a national advertising campaign.

"Why not? Here in the United States is a billion and a quarter dollar industry suffering from lack of protection and inadequate tariff rates, an industry that has never been advertised, and three million people depending on it for their livelihood.

"Here in Petaluma, the largest poultry center in the world, with hens producing 38,000,000 dozen eggs annually, and an investment of $21,000,000, are 24,000 people deepnding upon the industry.

"Petaluma has urged poultry and egg organizations in the United States to work out the question of advertising eggs and has taken the initiative with an Egg Day through which it will present educational exhibits, window displays, unique walking and float features, cooking demonstrations, a chicken parade, rodeo, an egg barbecue and other unique features characterizing the industry."

TUBERCULOSIS CAUSES HEAVY LOSS TO POULTRYMEN

This disease is especially destructive to flocks in the north and west. The course of the disease is slow, symptoms are apparent only in the late stages, and the mortality is high. Although birds may become infected at any age, the disease is not readily detected by ordinary observation in those under one year old, because months are required for the bacilli to multiply in the system sufficiently to interfere with the normal functioning of the body. The older fowls, from two to three years old, are most likely to display symptoms and show a high death rate.

One of the first symptoms is gradual emaciation which becomes especially noticeable in the breast muscles. These diminish in size until in advanced stages there is scarcely any flesh left on the breast bone. Feeling the breast region will readily detect this wasting. The appetite continues good. Lameness in one or both legs, or drooping of one or both wings is another symptom.

On our farm we have for a number of years kept on hand a supply of certain remedies for the treatment of disorders among our livestock. This every farmer should do. The necessary medicines can be obtained at comparatively small cost. After all, the expenditure of a few dollars is a trivial matter and it may be the means of saving the life of a valuable animal. Even with the greatest care cases will occur in which waiting for the arrival of a veterinarian will involve loss of time which may be fatal.

Still another thing that has been holding this old world back is the fact that too many men talk an hour for every minute they work.

"Pioneer" Baby Chicks

All the Popular Breeds
Every Day
Baby Ducks, Baby Turkeys

We can supply Baby Chicks in any quantity. Best quality. Can ship to any point within seventy-two hours' ride from Los Angeles.

Copyrighted Hatching Eggs, Fireless Brooders, Poultry Supplies, Remedies, Feed, Seed, Feeders, Fountains for sale.

Corn: Bulk No. 2 Yellow, 1.57½.
Milo: Eastern 1.65.
Bran: Kansas, 25.25.
Barley: Carloads, 1.31¼.

HAY

Alfalfa Growers of California report:

The market for alfalfa hay showed increased activity during the week in most parts of the state. Prices for common grades remained unchanged, while those for the better grades showed a stiffening tendency. The sustained better demand is undoubtedly the result of the small supplies in the hands of most dealers and users. The freight rate on hay from the Antelope Valley to Los Angeles has been reduced about a dollar a ton as the outcome of negotiations between the railroad and the association, after the representatives of the association had been in position to convince the railroad people that while the alfalfa growers of the valley will thereby save about $25,000 a year, the railroad will, directly and indirectly, be benefited to an even larger extent. We mention this to show the advantage of the growers being able to handle important matters of this kind as an organized whole, that is, as an association. There were 990 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending August 6, with 410 tons held over.

Prevailing prices last week f. o. b. Los Angeles:

No. 1 Dairy	19.00
Standard Alfalfa	15.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Cranberries	5.50
Bayos	7.50
Blackeyes	6.00

HAY AND FEED

Alfalfa Growers of California state that prevailing prices f. o. b. S. F. are:

No. 1 Dairy	15.00
Standard	14.00

Under date of August 6, A. W. Scott Co. says:

Receipts of hay during the week were 2,329 tons, as compared with 3,037 tons last week. Light and irregular demand with heavy receipts were the features of the San Francisco hay market during the week. Sales were weak and scattered and effected only by active salesmanship. Marine shipping is recovering and building construction is increasing. There is undoubtedly a better day coming. Holders of hay and grain who cannot find a sale now must simply "take up another hole in their belts" and wait with patience for better times. Mill and dairy feeds are influenced by the same conditiaons, and although fluctuating up and down they remain at the end of the week at practically former quotations. Alfalfa meal has been moving in little heavier volume for export, while coconut and oilcake meal have been picking up, chiefly because of the depletion in the stocks on hand.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, No. 1	15.00@18.00
Wheat Hay, fair grade	13.00@15.00
Tame Oat Hay	12.00@15.00
Wild Oat Hay, new crop	10.00@12.00
Barley Hay	10.00@12.00
Alfalfa Hay, 2nd and 3rd cutting	12.00@14.00
Alfalfa Hay, 1st cutting	9.00@11.00
Stock Hay	8.00@10.00
Barley, Ground	31.00@33.00

Oats: Red Feed, 1.20@1.30.

Corn: California yellow, 1.50@1.60; white Egyptian, 2.20@2.30 per cental; California red milo, 2.00@2.10; Eastern red milo, 1.85@1.95; Eastern kafir, 1.75@1.80.

Citrus Markets

Los Angeles, August 10, 1921.

Shipments of Valencias are holding up. They are usually ranging around 150 cars per day. Prices are holding very satisfactory.

Lemon prices have dropped materially but most good stock is still well received.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges 34,055 cars; lemons, 9,635; total, 43,690. To same date last season: Oranges, 26,597; lemons, 6,839; total, 33,436. From Central California to date this season: Oranges, 6,644; lemons, 212; total, 6,856. To same date last season: Oranges, 5,377; lemons, 289; total, 5,666. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

REPORT OF CATTLEMEN'S MARKETING COMMITTEE

Eastern markets are continuing to advance and are now in their strongest position for several months. California markets are holding steady to stronger. There is an especially good demand for lightweight steers, a considerable number of sales being reported at 6¼ and 6½ cents. The average carcass weight reported thus far this year is 54 pounds lighter than last year. Information received from southern Oregon and Nevada indicate that about one-half the usual number of cattle will be marketed in southern Oregon this fall and that there is a considerable shortage of cattle in Nevada. The bulk of beef cattle in central and southern California has been marketed. Very few, if any, commission cattle are going onto the market. Do not ship cattle on commission, and do not sell half fat cattle. We expect the market to continue steady to stronger during August.

BUMPERS FOR FLORIDA TRACTORS

Power farming in Florida is beset with all kinds of difficulties, and a lot of ingenuity has to be exercised in overcoming obstacles met with in reclaiming some of the Florida land, as, for instance, in plowing land which is covered with palmetto. The palmetto stems are very stiff and grow to considerable height. In order to give the plows a chance to do good work, the palmetto brusn must be broken down and crushed so that it can be turned under.

For this purpose some farmers are equipping their tractors with heavy bumpers placed rather low so that as the tractor moves forward the brush is crushed and broken. The brush breaking is further assisted by unusually long angle iron lugs which are put on the tractor wheels, the lugs being supported by extra spokes that run to the hub of the drive wheel where they are bolted on.

BEAN GROWERS EXPANDING

Bean growers are not particularly hilarious over market conditions but they are determined to hang together and secure the utmost out of the busted market. This is resulting in closer cooperation than has before been possible. The California Bean Growers Association still maintains its central office in San Francisco but now has thoroughly alive working branches in Yuba City, Sacramento, Stockton, Lompoc and Santa Maria, and is now establishing a large working center in Los Angeles in charge of S. D. Pine.

It is satisfactory to note that a slight increase in quotations has been made within the past few days. Mr. Pine reports that the new contract is proving entirely satisfactory to the members and to the entire movement. It is ironclad, in this, that once signed up with the association the member remains with it, but at the same time he has certain options which enable him to sell through the association to any individual shipper or commission man. This enables the association to protect other members and at the same time allow disposal of a portion of the crop.

The agreement on which the association is now operating may be terminated June 1, 1924. If it is not terminated, then it runs until the end of the 1926 crop season. The usual "liquidated damages" clause obtains which grants to the association sufficient to cover damages which may be caused by growers' withdrawal.

The HOW AND WHY OF GOOD PIE

MRS. BELLE DE GRAF

Director of the Sperry Domestic Science Department, to whom thousands of housewives look for practical help and kitchen-guidance. The recipes below were selected and tested by this home-cooking expert:

THE art of making rich, tender pie-crust is often considered impossible by many women who seem to think that success comes only to a chosen few. Given a good recipe and working quickly, any woman can make a good pie provided she understands the baking.

Even the more inexperienced housewife will be able to make an appetizing pie if she will study first the recipe, then the few simple rules regarding manipulation and baking.

It is a great help to have the ingredients cold — particularly for those unskilled in handling pie crust, but it is not essential. The process should be quickly done, handling the paste as lightly and as little as possible.

Pastry must be baked in a fairly hot oven with the greatest heat at the bottom; then it will be light. But if placed in a moderate oven the pastry will be oily and decidedly indigestible as well as unpalatable. After the pie has been in the oven ten minutes—or when the filling is heated through, the heat may be reduced.

Pies which contain a filling where eggs are used as the thickening medium should not be baked so rapidly that the filling boils or the mixture will separate and the pie will be watery. This applies to any form of custard pie.

It is unnecessary to grease pie plates for the fat in the crust is sufficient. Glass pie plates are very satisfactory, especially for deep pies. Plain or perforated tin can be used for the shallow pie or pastry sheils.

Pie crust should be rolled out to about one-eighth of an inch in thickness. When lining the pan, lay the crust on loosely and allow it to come a little over the edge. The scissors will be found the most convenient means of cutting the dough. If the pastry is stretched it will shrink and probably break while baking.

When making fruit pies which may be very juicy the undercrust can be brushed over with the unbeaten white of an egg—which coagulates as soon as the heat reaches it and makes an impervious coating. Or the bottom crust may be sprinkled with very fine dry bread crumbs or with a little flour which will absorb the excessive moisture at once and prevent the crust from being soaked. After the filling is put in, the top crust is placed in position; this should be rolled out about one-eighth of an inch thick also and should extend about a quarter of an inch beyond the pie plate. Then fold the top crust under the bottom one and either flute the edge with the fingers or a fork. Perforate the top crust so that the steam may escape—or the crust will be soggy on the under side. If a very dark brown is desired the top crust may be brushed over lightly with milk.

When making very juicy pies—allow one tablespoon of Sperry Drifted Snow Flour to each cupful of sugar used. Mix sugar and flour until well blended then sprinkle over fruit. Or the pie may be bound around the edge with a narrow strip of cloth which has been dipped in either milk or water.

When making pastry shells for a one-crust pie invert a deep pie pan and place the pastry on it, pinching about the edges to make a deep border. Prick the pastry in several places with a fork. Place in a hot oven; in about ten minutes the shell should be a golden color and should be watched carefully until ready to take from the oven. Remove from the tin and place the filling in the shell.

Pastry for several pies may be made at a time, rolled up and set in a cool place in a well-covered utensil until needed. This is often a great advantage for a busy housewife. Always serve pastry fresh or reheat if the pie is a day old and it will become crisp and fresh. The kind of pastry depends upon the amount of fat used and the method of putting the ingredients together.

Director Sperry Domestic Science Department

SPERRY PLAIN PASTRY

NOTE: All measurements are level and flour is sifted once before measuring. One-half pint measuring cup is used.

One and one-half cups Sperry Drifted Snow Flour, ½ teaspoon salt, ½ cup shortening, ⅓ (about) cup cold water.

Sift flour and salt together. Chop shortening into the flour; add liquid gradually, using knife. This dough should become stiff enough not to stick to the sides of mixing bowl. Place dough on moulding board and roll to ¼ inch thickness. Then fold one-third of this sheet of pastry over to the center, folding the remaining third over the first fold, then fold across. Roll to ¼ inch thickness again.

This pastry can be used at once, but is improved if allowed to stand several hours. By folding the dough in this manner, layers of air are enclosed, which expand when the pastry is placed in a hot oven, making the pie flaky. While the oven should be hot at first the heat should be reduced after it has browned.

LEMON PIE

Three tablespoons butter, 3 tablespoons Sperry Drifted Snow Flour, 1⅓ cups sugar, 1½ cups milk, 3 egg yolks, 3 egg whites, 2 lemons.

Cream butter, add ⅓ cup sugar, continue to cream. Beat yolks well; add to mixture, mix flour and sugar; add this to other ingredients and mix well; also add lemon juice and grated rind, milk and well-beaten whites of 2 eggs. Bake in pan lined with pastry. When baked and partly cold, make a meringue of remaining egg and set in a cool oven to brown.

MERINGUE

White of 1 egg, 2 tablespoons granlated sugar, ½ teaspoon lemon flavoring. Beat egg very stiff; add 1 tablespoon of sugar. Beat well and add remaining sugar. Meringue should be placed on cold or partly cold pie or pudding and baked in a slow oven.

PRUNE PIE

Two cups prunes, ⅓ cup sugar, 2 teaspoons butter, 2 tablespoons Sperry Drifted Snow Flour, 1 teaspoon lemon juice. Wash prunes and soak in cold water to cover, 2 hours or more. Cook slowly in same water until soft. Remove stones, cut prunes in quarters and mix with sugar and lemon juice. Line plate with pastry, cover with prunes, pour over liquor, dot with butter, dredge with flour, put on upper crust and bake in moderate oven.

Letting the Sun Do It in California Dry Yards

THE proportion of fruit which is going on the trays is much greater than for several years. In the past canners have been able to prepare our fruits so as to command higher price for that of canning quality than could possibly be secured when dried or evaporated. But last year, with sugar at 25 cents per pound and a market condition which looked like exceptionally long prices, induced the putting up of great quantities of high quality canned fruit. Today the packer is trying to get the sugar and fruit cost out of that last year's pack, hence limited demand for canning quality and the calling into action of the sulphur house and fruit tray. This has, however, enabled our producers to get their fruit into form for holding until cooperative marketing secures fair return to the producer.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Now it looks as if the dryers of peaches and apricots and prunes, especially, will find ready market for their product. The dried 'cot holdover is practically cleaned up; prunes have been in big demand abroad; future peach prices have been advanced. Altogether the prospects are cheering.

* * *

Imperial Valley shipped practically 10,000 cars of cantaloupes. This was nearly 1,000 cars in excess of any preceding season. The railroads take it that this great movement of fruit is proof that the present high freight rate is acceptable to the Valley growers. We venture, however, there were but few of these growers who received as much per acre for their fruit as did the railway company.

* * *

Capper wins with his bill providing for federal regulation of grain exchanges. It passed the senate after its passage by the house, but there are still some minor differences in amendments requested by the senate. In speaking on the bill Senator Capper denounced the Chicago board of trade as "the biggest gambling hell in the world." It is no credit to this nation that it has permitted this institution to retain its hold as long as it has. Senator Capper added: "It is against the law to run a gambling house anywhere in the United States, but today, under the cloak of business respectability, we are permitting the biggest gambling hell in the world to be operated on the Chicago board of trade. The big gamblers have made the Exchange Building in Chicago the world's greatest gambling house. Monte Carlo or the Casino at Havana are not to be compared with it. The extent and completeness of its system for rounding up suckers explains how the Chicago board of trade must 'sell' more grain every year than the entire globe produces, ranging from $15,000,000,000 to more than $20,000,000,000 in value."

* * *

A lot of us are thinking up what congress ought to do to save us and our industry. This is entirely proper for congress will bear watching. On the other hand, let's bear in mind that congress can't work out our salvation for us excepting as a mere incident. There are a lot of problems the working out of which is entirely in our own hands. For instance, some poultry sharps recently wanted to see how certain types of poultry were producing. They culled out 68 hens, put them in a pen by themselves and at the end of five days test, with heavy feeding, secured exactly one egg. All the protection on earth "won't make money out of them hens."

* * *

With the farm home electric lighting system, often with water under pressure, the telephone, good roads and automobile, there is no reason why every farm home should not have practically all the comforts of the city and in addition many other wonderful blessings possible out in the open air of California—no reason other than possibly that of cost, and here we remind the homemaker out in the broad acres of the fact that this last handicap operates in the city as well as on the farm. It costs money to lay sewers, pipelines for gas and for water, wires for telephones and lights, and the city's use of them is only possible because of awful expenditures and resulting awful taxes. So don't expect to get by on the farm without spending the money for it's worth the price.

* * *

The women who are members of the health department of an Eastern county farm bureau have pledged themselves to wear no more high heels and in addition to do all in their power to induce their daughters to take the same course. The beginnings are entirely wrong. The daughters should have set the style, for instance, there is the length of her skirt.

* * *

Ruskin says: "We can live without pictures, but not as well." Not a farm in California but has its wonderful outlook; it may be of richly colored desert with the green and white capped mountains, or of peaceful valleys, but we are still offered our pictures, that is, if we are wise in planning our homes and build into them broad and open windows. Insist on these wonderful window views so far as possible from every room in the home.

A. T. CURRIER

Alvan T. Currier, one of California's pioneer farmers, died at his home near Pomona, August 13. Mr. Currier first came to California in 1861 and since 1869 has been owner of a ranch of nearly 3,000 acres at Spadra, Los Angeles County. He not only has been one of California's foremost livestock and grain farmers, but entered in his early life somewhat into politics, having been elected to the office of sheriff of Los Angeles County and later to the state senate. In later years he has been devoting most of his energies to his farming operations, although he retained directorate in the First National Bank of Pomona, was president of the Walnut Growers Association, was one of the charter members, and from its beginning president, of the L. A. County Mutual Fire Insurance Company. Senator Currier was born in Maine in 1840.

Mr. Currier's life was not only an inspiration to California farmers but in social and religious life he was always active, giving much of his own time and means.

ETERNAL VIGILANCE

The Poultry Producers of Central California announces the contemplated visit of the general manager to London and other British cities for the purpose of disposing of large shipments of eggs and making a study of possible markets for Pacific Coast produced eggs. In a letter to members the situation confronting Pacific Coast egg producers was touched at some length. From this we take a mere hint:

"Egg production in California has now increased to such an extent that we produce a great many more eggs than can possibly be consumed on the home market. This means that in order to secure reasonable prices in our home market the large surplus must be moved out of the state to other markets. So far we have depended mainly on the New York market to take our surplus; there is no other market in this country that will take many of our eggs at a profitable price. This market is now being supplied to a large extent with white eggs similar to ours in style and quality, from the states of Oregon and Washington. The poultry industry in those states is increasing even more rapidly than it is in California. They must seek a satisfactory outlet for their surplus eggs, just as we do, and consequently they are now very active competitors of ours in the New York market. If the supply of Pacific Coast white eggs on the New York market increases faster than the demand, this condition will naturally tend to lower the price, which in turn will react on our home market and mean lower prices here."

All of which means that the poultry business is looming large; also that its only salvation is everlasting cooperation. Not only must the cooperation be complete in the neighborhood, but in all the state, and especially between the different associations. The independent who will insist on remaining "free and untrammelled" is jeopardizing his own future. Worse, he is jeopardizing the future of the entire industry.

DELAYED IMPROVEMENT

Nipomo, August 12, 1921.—Your editorial "More and Better Roads" noted. Very good. I want to say a word for the Auto Clubs.

I have been agitating for a delayed road improvement between Nipomo and Guadalupe. Among other things I wrote to The Automobile Club of Southern California about said improvement and they jumped on the job with both feet, and immediately. And I firmly believe that the Auto Club has brought this particular improvement several years nearer, as we have reports that the work will be started very soon.

I received two very nice letters from the club, and I am not a member of this club either.

All of our public servants are politic and politicians need attention after elections.

Farmers are generally too busy for this work and they should appreciate the efforts of the automobile clubs as well as the work done by the California Highway Commission, county engineers, etc. Yours truly, Frank Littig.

We appreciate the opportunity of getting this particular angle on the present fight being made by the automobile clubs. If we have it correctly, one of the principal contentions of the clubs has been that the highway commission would not accept suggestions which have been made by it or its engineers. If the contention of our subscriber is correct that the automobile club did secure the desired improvement more quickly than would otherwise have been possible, it is proof that in at least one instance the automobile club secured what it went after.

However, we think there is one statement in Mr. Littig's letter which is not entirely correct. We do not believe that "all our public servants are politic and politicians." When a typical politician's activities are brought to light by the merciless publicity of the daily paper we sometimes jump to the conclusion that all our public servants are corrupt, or at least doing politics. It would be as fair to take the first news page of a sensational daily paper with its murders and scandals concerning an infinitely small percentage of the people as the correct measure of the life of average people.

Our needs and our private expenses increase, sometimes we feel without rhyme or reason. Likewise, we, the taxpayers, realize that our state must march forward and our public needs and public expenditures increase much in the same proportion as do our own. Hence, taxes mount. We help them along by voting new bond issues. However, the tax gatherer is in little favor for we forget the enthusiasm of election day at taxpaying time. We become angered, and it is easy to charge our public servants with being corrupt.

Or if there is plainly no corruption and our pet schemes fail of accomplishment we listen attentively when agitation is started which embarrasses the people who have charge of the work and compel them to fight a defensive battle instead of accomplishing real advance. Every step of the present fight on the commission is causing delay in California's good roads construction.

We believe there are thousands of conscientious, hard working officials in this state doing their level best.

Notwithstanding that, we would suggest that if farmers are generally "too busy for this work" they may well use some organized effort to do the "watching." But when the long headed "watchers" after years of faithful service take steps which make it look as if the "politics" were not all on one side, is it not wise for us, the taxpayers and laymen, to open our eyes and make some observations of our own?

For instance, quoting from the report on the California State Highways by the California and Southern California Auto Clubs, this paragraph on Page X:

"The Commission's attitude toward highway contractors of excellent standing has been the cause of severe criticism from contractors of the soundest reputation. Highway contractors in the past have found little profit in highway work. The list of contracting firms who have become bankrupt is astonishing. Numerous instances of rigid and drastic rulings involving considerable losses to the contractor have been cited, causing some contractors to claim that the Commission's policy has been one of alienation rather than of cooperation. Such policies can have only one result; an increase in future prices bid."

This is quoted not with the idea of endorsing entirely the position taken by the highway commission, neither of endorsing the attitude of the automobile clubs in making this a part of their report. However, we cannot see in that the slightest cause for a charge of doing politics or of failing to watch after the taxpayers closest interests. There is naturally opportunity for contention between employer and employe, and there have been plenty of occasions in the building of California's highways where contracting firms have not built according to specifications, but we have never heard it charged that this was done with the connivance of the commission, and there is evidence in the report of the automobile club that the commission has been absolutely on the square with the taxpayer.

To us it appeals as an encouraging fact that we have a commission looking after the interests, not of the contractors, but of the taxpayers, and more than a little strange that such action should be presented to the taxpayers as blameworthy.

California Cultivator

Vol. LVII, No. 8 | Los Angeles, August 20, 1921 | One Dollar Yearly

Cooperative Farmers Invest Quarter of a Million

COOPERATORS of California have furnished abundant proof of the fact that they can really and truly cooperate, that they can go down in their jeans and dig up the money which will construct buildings and purchase appliances and provide marketing machinery which makes possible disposal of their products at a profit, or at least that stands a show for profit when marketing conditions are normal. The best of it is that our cooperators are big enough to see through the dust which is sometimes stirred up by antagonizing interests. They see through it and far enough into the clear beyond to stand pat and wait till it lifts.

This has been largely because of the initiative taken by a handful of orange growers nearly 30 years ago. The crude appliances possible to those early cooperators and the lack of men with knowledge of marketing or even of packing methods make it appear wonderful to those who look at present methods and then backward to those days in the early 90's. Those early cooperators used railway warehouses, open sheds along sidetracks, fruit canneries, and all without equipment, and still they stuck together. Ultimately the stronger hearted urged equipment, and a few hundreds, sometimes thousands, were borrowed, and pitifully inadequate structures put up to handle the fruit.

Time has passed and on this page appears the photograph of one of the world's finest packing houses. It is all concrete; it is practically fireproof; it is complete in every sense, that is, for the purpose of preparing for market and packing oranges. It is in the little town of La Verne near Pomona, Los Angeles County. D. G. Arbuthnot has been for many years manager of the association and is now operating in the old packing house near this new one, construction of which has just been completed. Work will be continued in the house so long as needed. In addition lemon growers of the same section have an association with separate house handling about 150 cars of lemons. The directors of the La Verne Fruit Exchange, La Verne Orange Association, and La Verne Lemon Association are: D. C. Crookshank, president Fruit Exchange and Orange Association; Dr. V. W. Baker, vice president Fruit Exchange; H. E. Howard, president La Verne Lemon Association; L. E. Cree, vice president, La Verne Lemon Association; R. L. Davis, vice president, La Verne Orange Association; V. Peyton, W. S. Romick, H. V. Bright, A. J. Gilbert, J. C. Gapp, I. L. Noggle, John Weber, J. T. Titsworth.

When California Producers Cooperate They Cooperate Right

Here is a packing house built and owned by orange growers at La Verne in eastern Los Angeles County. It cost $275,000 and is complete in every respect.

We have asked Manager Arbuthnot for some facts regarding the plant and he writes:

"The new plant was started about the middle of March and we packed and handled through that plant 300 cars of Navels. The plant has proven very efficient and satisfactory in every respect.

"The dimensions of the packing house proper are 136 by 180 feet, with basement under the entire structure. About one-half of this basement is used for the precooling plant having a capacity of precooling 50 cars of oranges. We carry the refrigeration to the rooms by means of a large circulating fan which forces the cold air through the room. This is a continuous circulation, the fan blowing the air across a series of coils through which we pump the cold brine from the ice tank. We can thus maintain any temperature we desire. It takes about 72 hours to properly precool a car of oranges.

"In addition to the packing house we have a machinery room 50 feet by 80 feet. All the necessary mechanical equipment for an ice plant is installed in this room. We are using electric power and have installed a motor of 125 horsepower. The type of motor which we are using is something new to this country, being synchronous motor using 22 volts. It is directly connected onto the shaft and drives the compressor at high speed. The plant has an ice capacity of 55 tons. This plant has a capacity for packing and precooling from 10 to 12 cars per day. The cost of the entire plant including all the necessary ice making equipment is approximately $275,000.

"The association owns another plant which has been built for 12 years. Seven years ago a precooling plant was installed in connection with the packing plant which has proven very satisfactory. The output of the association varies from 1,200 to 1,600 cars per year.

"In addition to these packing houses the association owns a number of houses built for its employes, principally the Mexicans. These houses consist of three rooms and are sanitary in every way. The association also has recently built a dormitory for its packing house employes which has about 20 apartments that are very convenient. During the heavy shipping season the association employs about 300 workers.

"The lemon growers have a separate association which handles about 150 cars of lemons. Both the Orange and Lemon Associations handle their sales through the La Verne Fruit Exchange, D. G. Arbuthnot being secretary and manager, and he is also general manager of the La Verne Orange Association and La Verne Lemon Association. E. P. Jochimsen is manager of the La Verne Orange Association, and J. W. Lamont is the manager of the La Verne Lemon Association."

Concerning the Yuccas

By William M. Bristol

WITHIN the past few weeks there have been many protests against the cutting of the blossom stalks of the Yucca Whipplei, those gigantic and spectacular plumes of creamy white flowers which jump up like magic all over the hills and washes of Southern California in springtime. Everyone agrees that this is the most wonderful and interesting of all the California flora and it is not strange that many have cried out against the vandalism.

I heartily agree with the objectors that these marvelous flowers, like all the wild things of nature, lose their charm in captivity. It is only fair to say, however, that the danger of extinction of the species is not as great as feared. It seems to be assumed that cutting the blossom stalk kills the plant, but this is not quite true. The plant dies anyhow as soon as it has bloomed and ripened its seed. To be sure, continued and systematic cutting of all blooms would eventually exterminate the family, but it would require at least a quarter of a century to accomplish this for the plants which bloomed this year have been somewhere from 20 to 30 years getting ready for their day of destiny.

The life habit of the yucca in question seems to be known to but few people, even among those who dwell in their midst. Perhaps it is because a dozen of the plants were growing within a hundred feet of the spot where I built my house on the East Highlands mesa in San Bernardino County, 30 years ago, that I have come to know them so intimately. At that time these plants were almost as large as others which bloomed that same year. But not one of them were ready for their crowning glory—and their crowning sacrifice. In fact, it was nearly a dozen years before even one of them was ready and nearly half a dozen years more before all of them bloomed. In the meantine I had gone into the hills and dug up small plants to replace those which nature had put in my dooryard—for to captivity of that character I do not object. It must be the transplanting hastens the blooming of the yucca, for these imported wildlings all finished their careers within six or seven years after they were moved.

About ten years ago I planted a yucca seedbed. At that time the people of Redlands started a movement to beautify the highway across the Santa Ana wash between their city and Highland. It occurred to me that a logical way to beautify a stretch of waste country would be to augment the indigenous vegetation which has demonstrated its ability to thrive therin. The evergreen scrub cedar, also known as juniper, the yerba santa and the yuccas flourish in this two mile strip of wash, but the attractiveness of the drive would be enhanced by increasing their numbers by ten or even a hundred fold. I planted a hatful of yucca seed, the product of two or three stalks, and raised 10,000 plants. They grew like weeds in their unusual environment, and when they were a year old I offered to donate them for planting along the roadway in question. But the committee in charge of the adornment of the said highway elected to plant two straight rows of eucalyptus trees in that drouthy soil, and after making an extensive planting of the little yuccas in my home grounds I reluctantly threw the rest away. The two rows of eucalyptus trees, kept alive by the expensive method of hauling water to them for a number of years, serve today to advertise the poverty of the sand in which they were set and, fortunately, do not cut off the magnificent mountain cyclorama which the wash drive affords. Although I am a member of the San Bernardino County forestry commission I am frank to say that I do not favor shading a paved road nor cutting off, with monotonous rows of shade trees, the scenery for which California is famous. In these days of autmobiles no thought need be given to the comfort of the horse; and as for the motorist himself, he carries his shade with him wherever he goes. But I have digressed.

I said in beginning my story that I am intimately acquainted with the yucca. I must add, however, that only a few months ago I learned something about them that had escaped my notice for 30 years. I had observed that those growing along the Highland foothills bloom in April and May, while those of the Cajon Pass region come several weeks later. I supposed this

Agricultural News Notes of the Pacific Coast

Northern California

Colusa County reports two crops as heavy; grain and plums.

The Shasta County fair wil be opened at Anderson, October 6.

Colusa is sending out heavy shipments of barley on river barges.

Petaluma is celebrating Egg Day today and tomorrow, August 20 and 21.

Humboldt County reports a big crop of wild blackberries of excellent quality.

Dr. W. P. Jackson of Chico has been named livestock inspector of Butte County.

Pear growers in Eldorado County report excellent results from use of alfalfa for fertilizer.

More than 100,000 young pear trees in Contra Costa County are this year in bearing for the first time.

By far the heaviest tree planting in El Dorado County last spring was of pears, the number being 34,227.

The "Inter-Mountain Fair" of Shasta County will be held in Fall River Valley, at McArthur, October 8-10.

Goat breeders are expecting the coming state fair to show the largest exhibit in goats yet made in this state.

Yuba County supervisors have appropriated funds for exhibiting and advertising Yuba County at the state fair.

California Almond Growers Exchange is putting up a big fight for adequate tariff. Manager Tucker is in Washington.

Andrew Johnson, near Santa Rosa, Sonoma County, has a field of kale in which some of the plants are more than 11 feet high.

In the week ending July 30 there were 43,500 dozen eggs shipped from San Francisco for Hawaii and 83,650 dozen for England.

The dairymen's association on the State Land Settlement Colony at Durham has selected J. L. Cummings to operate the creamery station.

Ranchers at Sycamore, Colusa County, have finished harvesting and hauling of grain. Both quality and quantity are better than last year.

The Glenn County pig club has 31 members, enthusiastic boys and girls who are keeping close track of the gains made by their pet pigs.

The Sacramento County forestry board has begun suit against an electric power company which is alleged to have cut trees between Twelve Mile House and Folsom.

Barley growers at Red Bluff, Tehama County, members of the farm bureau, sold their barley at $1.25 a hundred weight, claimed to be the highest price paid in the state.

Petaluma expects soon to have a poultry experiment station in the old F Street school. Report is that the station will be handled cooperatively by national and state departments.

At a meeting of Shasta County dairymen at Redding last week a committee was appointed to take the census of dairy cows and organize a dairymen's branch of the farm bureau.

Dr. J. C. Whitten of the University of California and J. J. Fox of San Francisco have been named judges of the horticultural exhibits at the 1921 California State Fair, September 3 to 11.

Central California

Sweet potatoes are being shipped from Turlock, Denair, Hughson and Keyes, Stanislaus County.

The first carload of Thompson Seedless grapes to be shipped from Lindsay, Tulare County, went east July 28.

Prices set for figs in Tulare County will net the growers seven cents for Adriatics and nine cents for Calimyrnas.

The college of agriculture of the state university announces a correspondence course of 12 lessons in practical beekeeping.

The Tulare County Fruit Exchange will ship out between 1,500 and 1,600 carloads of citrus fruit, Navels, Valencias and lemons.

Turlock melon growers find the Eastern market is being supplied with local melons and in consequence are receiving lower prices.

Poultry culling demonstrations were held in Kings County last week by R. B. Easson, poultry specialist of the University of California.

The Central California Berry Growers Association has named a minimum price of 8 cents to canners for August-September strawberries.

The onion seed crop is being harvested in the Richgrove section of Tulare County. Much of the onion seed is grown as intercrop in orchards.

O. E. Lambert, Stanislaus County, has six acres of Hubam, or annual white clover, in a young plum orchard, that is seven feet high, planted in late spring.

Selma, Fresno County, is planning to build a community ice plant. Representatives from that city have been inspecting the community plant at Lindsay.

Twenty-four students from the division of pomology of the University of California visited Kings County last week to make a study of fruit growing and marketing.

Mayor Hart of Fresno called a conference of towns in the district about Fresno, Saturday, August 6, to organize association for developing a power and irrigation project in Squaw Valley.

Plant Pathologist Boncquet of Tulare County has asked the supervisors for an appropriation of $2,000 with which to carry on special study of June drop. He has made similar request for fund for studying grape disease.

Horticultural Commissioner Haupt of Kings County reports: "During the fiscal year of 1920 and 1921 a total of 1,870 cars shipped from Kings County to Eastern markets, all of which complied with the standardization laws."

Auto traffic control on the Giant Forest road between Kaweah and the forest has been in operation for a month and has proved extremely satisfactory. During the last two weeks of July nearly 2,000 autos entered the park over this road.

The Modesto Herald says: "The sweet potato outlook in the Turlock district is one of the best in years, taking it acre for acre. Total acreage is approximately 3,285. It is probable that the price at the beginning of the season will be from 8 to 10 cents a pound."

Southern California

A great Iowa picnic was held at Bixby Park, Long Beach, last Saturday.

Orchardists of Yucaipa met August 9 to discuss picking prices for apples.

The Imperial Valley reports an unusually large planting of sweet corn.

The American has installed a sugar beet dump at Wintersburg, Orange County.

A horse show will be on the program of the Ventura County fair, October 5-8.

Escondido, San Diego County, will celebrate its annual grape day September 9.

The annual meeting of the Los Angeles County farm bureau will be held at Ganesha Park, Pomona.

The Southern California farm bureau egg laying contest begins at Pomona, October 1.

San Gabriel Valley communities are still up in arms against the hog garbage feeding proposition.

Ojai, Ventura County, will hold a big free barbecue and carnival during the last week in August.

Riverside has to date shipped one-half more lemons than were shipped during the whole of 1920.

Two Orange County sugar factories, one at Dyer and one at Huntington Beach, commenced operations August 1.

Talbert, Orange County, celery growers set out the first plants during the first week in August, totaling 55 acres.

Ventura County is amused and somewhat disgusted with newspaper stories of a citrus parasite which is terrorizing orchardists.

Plantings of Acala cotton in the Palo Verde Valley, Riverside County, are showing 1⅛ inch staple with heavy crop on the stalks.

An Agricultural Taxpayers League has been organized in Ventura County. The first regular meeting will be held at Ventura, August 29.

The associated chambers of commerce of Coachella Valley are getting behind plans for celebrating the Date Festival, October 21-23.

Farm Adviser Fox of San Bernardino County has resigned to take position in the agricultural department of the Pasadena high school.

The Orange County farm bureau and California Fruit Growers Exchange have established a cooperative employment bureau at Santa Ana.

Santa Barbara County farm bureau is now collecting exhibits which will represent it at the state fair. Walnuts, lemons and beans will have chief honor.

Little Bear Lake in the mountains north of San Bernardino is reported to have been sold to Los Angeles capitalists who will build a big pleasure hotel.

President Jerome of the California Bean Growers Association says that Orange County bean growers as a whole have declined to enter the state association.

Ranchers of the Palo Verde Valley, Riverside County, are getting together in an effort to bring in a large number of feeders from Arizona. Recent reduction in freight rates is the occasion.

The Coast and General

Montana will hold ten county fairs from August 26 to October 1.

Pomegranates are reported to be a heavy crop throughout all parts of California.

The Washington apple crop is rated 98 per cent of normal as against 65 per cent last year.

A cotton gin on the U. S. reclamation railroad, 12 miles south of Yuma, was totally destroyed by fire.

California shipments of Elberta peaches will total 500,000 boxes, the same amount as shipped last year.

Figs are the only subtropical fruits listed in the 1920 census report as growing in the state of Washington.

The berry crop of the Puyallup district, Washington, comprising five counties, will be three times that of 1920.

High waters on the Verde river damaged the new intakes of the new city water system of Phoenix, Arizona, which is nearing completion.

Sloper Brothers, Independence, Oregon, planted broccoli between the rows of their hop fields on 12 acres and received $4,700 for the crop.

Two ten weeks courses in agriculture will be given by the University of Idaho at Moscow, the first beginning October 7; the second, January 4.

C. U. Pickrell, formerly manager of the Babbitt-Cowden ranch of the Salt River Valley, has been selected county farm agent for Yavapai County, Arizona.

The report of the Arizona agricultural statistician for July indicates a condition of 89 per cent of normal for the cotton crop as compared with 64.7 for the entire country.

The first load of 1921 cotton in the Salt River Valley, Arizona, was hauled to the gin July 30. While this is the so-called "volunteer" cotton, it has a staple length of 1 9/16 inches.

The cost of hauling freight over the new road system in Maricopa County, Arizona, is estimated by stage companies to be approximately one cent for each 100 pounds for each mile.

Cantaloupe shipments from the Salt River Valley of Arizona totaled 1,459 cars, compared with 1,146 in 1920, 1,621 in 1919, 1,173 in 1918, 1,314 in 1917, 865 in 1916, 490 in 1915, and 562 in 1914.

Rains have fallen over nearly all parts of the Arizona range country during the past week. The result will be the saving of thousands of head of cattle and sheep. Although water shortage may imperil livestock in some districts before fall, the rains have helped out feed conditions and to a very large degree will provide sufficient stock water to prevent further loss.

An example of cooperation is that of the residents of the Chandler district in the Salt River Valley. The direct road to Florence from that town was badly in need of repair but no funds were available, so the citizens turned out and practically built seven miles of road. This is a part of the Bankhead national highway and shortens the distance to Tucson from Phoenix several miles. Citizens of Florence are to rebuild a portion of the road west of that town.

Home Made Fruit Juices

By W. V. Cruess, University of California

FRUIT juices have many uses in the household and serve to maintain health during that season of the year when fruits are not abundant. On hot summer days nothing is quite so refreshing as a generous glass of iced berry or grape or other highly flavored juices. Salads, gelatins, fruit pies and fruit punches are greatly improved by the addition of fruit juices. There are many excellent juices on the market and we should by all means patronize the manufacturers of such juices to the limit of our means; but we can supplement the factory made products by putting up in the kitchen a home made supply from the fruits of our own orchards or from fruit that we may purchase from our neighbors. The process is not difficult and is more interesting than canning.

Equipment Needed

Practically every kitchen contains most of the equipment needed. A large aluminum or agate ware kettle is needed for heating the fruit; a wash boiler sterilizer for sterilizing the bottled juice; a small meat press or small fruit press is desirable, although the juice may be expressed from the fruit by use of a cheesecloth bag; crown caps (soda water bottle caps) and a small hand power bottle capper such as most hardware stores advertise for the use of "home brewers" is very desirable but not necessary, and a dairy thermometer registering to 180 degrees Fahrenheit or above is needed. The thermometer can be purchased from a drug store usually for less than $1. For citrus fruits a glass cone of the type distributed by the California Fruit Growers Exchange to its customers is required. Grocery stores carry these.

Crushing the Fruits

A food chopper will be found very satisfactory for crushing all varieties of fruits. It is slow but effective. Berries, grapes and other soft fruits may be crushed with the hands or with a potato masher. Crushing facilitates heating and pressing out of the juice.

In order to obtain a good yield of juice and to improve the clearness of the product the fruit should be heated, with two exceptions. Do not heat citrus fruits or pomegranates.

An aluminum or heavily tinned or agate ware kettle must be employed in heating the fruit in order that there shall be no action of the juice on metal. Do not use galvanized metal. It forms a violent poison with fruit juice.

Place the fruit over a slow fire and stir constantly with a thermometer inserted in the crushed fruit, until the temperature of the fruit reaches 160 degrees Fahrenheit. Constant stirring avoids overheating of some portions of the fruit. Fruit which is heated to boiling will have a cooked flavor and not the fresh fruit flavor that it is desirable to retain. This point is extremely important. Many recipes call for heating the fruit or juice to boiling. This is a serious mistake.

Some Steps in Processing Fruit Juices
1, Heating the crushed fruit; 2, pressing out the juice; 3, straining the juice.

As soon as the fruit reaches 160 degrees Fahrenheit remove it from the fire and to the press.

Pressing

This is accomplished in one of two ways. A small hand power meat or fruit press is best. If such is available first place in the press a large heavy, clean cloth or two or three thicknesses of cheesecloth. The cloth should entirely enclose the fruit. If press is not available press through a cloth bag with the hands.

Straining the Juice

Strain the hot juice through a heavy jelly bag several times until it is as clear as it is possible to make it by this means. Citrus fruit juices should be given a rough straining only through cheesecloth to remove the coarser particles because most of the flavor of citrus juices is in the pulp.

Bottling the Juice

Fill bottles to within about 1½ inches of the top. If ordinary corks are to be used first boil the corks in water; insert them hot in the bottles and tie them down securely with a string to prevent their being forced from the bottles during pasteurization. Crown caps, that is soda water bottle or "home brew" bottle caps, need not be boiled. Place them on the bottles and close them.

The tying of corks requires considerable skill, but explicit directions will be given by any druggist; the loop used by drug clerks in tying magnesium citrate bottles, etc., is the one to use.

Pasteurizing

The bottled juice will soon ferment, burst the bottles and damage the features of the nearest bystander, unless it is pasteurized within 48 hours after bottling. It should be pasteurized at once. Pasteurization is simply sterilization at a temperature below that of boiling water.

Place the bottles horizontally in a large pot of cold or lukewarm water. A false bottom consisting of a screen or a large cloth should be used to protect the bottles from the direct flame.

Cover the bottles completely with water. Heat slowly with thermometer inserted in the water until the temperature reaches 175 degrees Fahrenheit. Keep the water at this temperature for 30 minutes. Remove the bottles and allow to cool in a room where the draft will not strike them.

Corked bottles should be sealed by dipping the necks of the bottles in hot melted paraffin. Crown caps do not require this treatment.

The bottles in any case during pasteurization must be placed horizontally in order that the hot juice shall be in contact with the caps or corks; otherwise the air space in the top of the bottle protects the cork or cap and molds or yeasts thereon are not killed.

Use of Jars

Ordinary fruit jars are suitable for fruit juices and are used in the same way as bottles. The juice is placed in the jars to within about one-half inch of the top. Scalded rubbers and lids are placed on the jars and the lids screwed or clamped down tightly. The jars are then placed horizontally in the sterilizer and pasteurized as directed for bottles.

Sweetened Berry Juices

All berry juices and citrus juices require the addition of sugar. For each pint of juice add one pound of sugar for sour juices and one-half pound for soft ripe berries. This is added after the juice is strained and before bottling. These juices are diluted with water when served.

Orange Juice

One pint of orange juice, one-half pint of lemon juice and 1½ pounds of sugar make a good combination. Orange juice alone soon loses its flavor after bottling. Bottle and pasteurize.

Grapefruit Juice

One pint of the juice and one-half pound of sugar is about the proper ratio of juice to sugar. Bottle and pasteurize.

Lemon Juice

Lemon juice requires the full pound of sugar per pint of juice. Bottle and pasteurize.

Grape Juice

Use equal parts of Muscat and red wine grapes. Crush. Heat to 160 degrees Fahrenheit; press; strain; bottle and pasteurize at 175 degrees Fahrenheit for 30 minutes.

Or use Concord or Isabella grapes. Crush, heat and bottle as directed for the Muscat blend.

Wine grapes alone are rather flat in taste, hence the need of adding an equal quantity of Muscat.

Pomegranate Juice

This is one of the best juices made. Open the fruit and remove the red "seeds." Discard the outer rind and pulp. Crush the "seeds" and press out the juice. Heat the juice to 160 degrees Fahrenheit and allow to stand over night. Strain. Add one-half pound sugar per pint of juice and bottle and pasteurize. Serve diluted with water.

Apple Juice

Crush; heat to 160 degrees Fahrenheit; press; strain; bottle and pasteurize. Or crush; press; heat to 160 degrees Fahrenheit; strain; bottle and pasteurize. The second method is preferred.

Kern County Boys Show the Way

By R. P. Royce

ELK. DICKSON, local club leader of the Kern County Union High School, has organized one of the most successful boys agricultural clubs to be found in the whole country, and during the past two years the activities of the club have been of such practical worth as to attract wide attention and the club members have come to be important factors in the agricultural development of their county.

The club was organized, or rather reorganized, in the fall of 1919, and the first project inaugurated was a pig litter contest. Thirty boys purchased pure bred sows, and in passing it might be mentioned that the class of sows secured was considerably above the average used in pig club work. A local bank financed the operations of the club to the extent of a loan of $5,550. Later the Kern County Union High School loaned the club $1,000 for the purchase of a suitable boar the services of which were available to all the club members.

During the first year accurate account was kept by each boy of the cost of raising his pigs to weaning age. The figures were published in a 72 page bulletin.

Last fall and again this past spring feeding tests were undertaken to ascertain the cost of producing a pound of pork. As is the usual custom, the results are given in terms of grain. The following figures, which are taken from the club's latest publication, "The Cost of Raising a Pound of Pork in Terms of Grain," should prove of interest to men interested in raising hogs and should demonstrate to many barley farmers a better method of marketing their crops.

The first test was started September 24 with 12 pure bred Poland China barrows, and is described in detail by Earl Ahmann, one of the club boys, as follows:

"They were good, thrifty pigs. Their weights varied from 52 to 121 pounds, making an uneven lot of hogs, but a good one to collect records from, as the results show how hogs gain when started at different sizes and ages.

"When entering the test these barrows were given range on fair alfalfa pasture and a self feeder with ground barley, ground milo and tankage. Each morning and evening they were fed all the soaked feed they would clean up at the time of feeding. This soaked feed was a mixture of equal parts of ground barley and ground milo.

"After the first month of feeding the alfalfa pasture became very short, due to cold weather, and hardly figured any longer in the ration. Beginning the seventh week, we started feeding a lot of comparatively poor barley—not very finely ground and somewhat dirty. It will be noticed that considerably more of this barley was required to make a pound of gain than

(Continued on Page 184.)

Marl-Lime

IS

THE LIME

The Marl-Lime and Fertilizer Co., offers the ranchers of California a high grade Marl-Lime fertilizer immediately available to plant growth, — a natural soil tonic, odorless and soluble. The deposit being situated near San Dimas it is a short haul to thousands of acres of citrus groves, farms and gardens.

Marl-Lime is, we believe, the most valuable fertilizer product on the market for the money.

Dr. R. R. Snowden, chemist, says: "The extreme fineness of texture of this material gives it an extra value for agricultural use. Crops needing lime may be expected to respond promptly to adequate applications of the same, which gives it a value above that of ordinary limestone."

Canning Peach Growers Organizing

By M. D. McLeod

WE have many outstanding examples of the benefits to farmer and consumer alike of the cooperative idea. The American farmer is probably unlike any other farmer in the world. He is progressive, not saving. When markets are good and prices high he thinks of nothing further than improvement, enlarging his acreage, buying out his neighbor in order to have larger holdings. The latest type tractors, harvesters, or other farming implements must be seen at work on his fields or in his orchards. There seems to be very little thought that next year may not be so prosperous.

The American farmer has always been an individualist, but today he is forced to sell his produce to combinations of keen business men who know when they have an advantage. They understand the situation and know that so long as they can work upon unorganized industry they have their hands on both the credit and debit side of that particular line. Therefore, upon the realization of these facts we have witnessed from time to time the organization of one farming industry after another. It is only necessary to look at the personnel of the originators of cooperative movements. They are mostly men of previous commercial business experience, men who have been drawn into ranching or farming through inheritance or voluntary investment. These are the men who have quickly realized the unsatisfactory business position of the farmer. These are the men who are helping today to put the producing end on a par with the selling end, and we should be very thankful.

It is natural then that the last of the great unorganized fruit industries of California, that of the canning peach growers, should heed the signs and rid itself of the old threadbare byword of "independence" for that of "cooperation." This has been done in the northern districts with as much success as could be expected from local organizations, but we must have a state unit rather than county units as the latter may be set at each other's throats, and while they have been the stepping stone to greater cooperation we can readily pick the flaws, and should correct these as quickly as possible.

A state organization has already been started by the growers of Sutter County who are at present about 60 per cent associated and incorporated under the name "Sutter Peach Growers," with articles of incorporation providing for state wide expansion. They are now campaigning the rest of the state. The first meeting was held August 16 at Walnut Grove, Sacramento County, followed by meetings at Modesto, Atwater, Selma and today, August 20, at Visalia. Riverside County will be included August 22.

Enthusiastic support of the plan is prevalent throughout our entire preparation. Growers do not wish to see another $35 year. We cannot return our investment during the life of an orchard at $35 per ton for the fruit. Our object is to stabilize returns, to keep them within reasonable limits and profitable income. In order to prevent $10 years, such as 1915, we must prevent $100 years such as 1920. If we allow the pendulum to swing too far one way we must expect that through the natural laws of nature it will swing just as far the other. Therefore, it is plain that in order to stabilize we must have a governor and that governor must be a central office run absolutely in the interests of the growers. This office will collect information and data regarding costs and market conditions that will place it upon a par with any organized branch of commercial enterprise with which we may be called uopn to compete. We will know as much about our own business as anyone else, which is not the case today. We want to see the buyers and canners prosper because in so doing they are spreading California fruits and vegetables throughout the world's markets and are helping in the distribution of the vastly increasing production which in the past 11 years has multiplied 300 per cent, and we must help in finding new markets through a well laid plan of advertising. If this is not done we will simply have to stop planting. We cannot go on with this one sided game; from no angle today can it be looked upon as a good business investment.

Prune and Apricot Growers

"MOST encouraging" is the good word of comment from the California Prune and Apricot Growers Association.

In discussing the situation, Mr. Coydendall reports a practical clean-up of the old crop apricots and an early market development on the new crop at excellent prices. "With the opening of the harvest season the very light cannery purchase and consequent increase in dried production, the market on apricots slumped temporarily. Although our association policy is somewhat changed this year in that we are not opening with guaranteed prices, our firm stand through the period of slump enabled us to bring about recovery and have now a very sound market that we hope can be maintained for the sale of the season's production. Of course, all markets are very susceptible these days to a break on the least provocation, but with our association handling the bulk of the production and holding firmly through periods of slump and backed up by merchandising campaign plan, we are looking forward to a more successful and profitable season than anticipated after the depression of the past year.

"On prunes where we have held over a considerable portion of the past season's crop, the last couple of weeks our market has recovered and we are rapidly disposing of the balance on hand. Our packing houses will be busy for the next two months packing out this holdover. The trade has also begun to take an interest in futures on the new crop. Prices are firming up and apparently a sound demand is developing. From our surveys we have report of an excellent consumer trade developed throughout the country and no overstock on hand at any point.

"The export business is developing marvelously and consumption and sound business seem to be on the increase. Our New York plant certainly places us in close touch with this market and is developing a wonderful business for us. We are at present preparing a shipment of machinery to double the capacity of the New York plant. During the coming season our packing there will be a large item of our business."

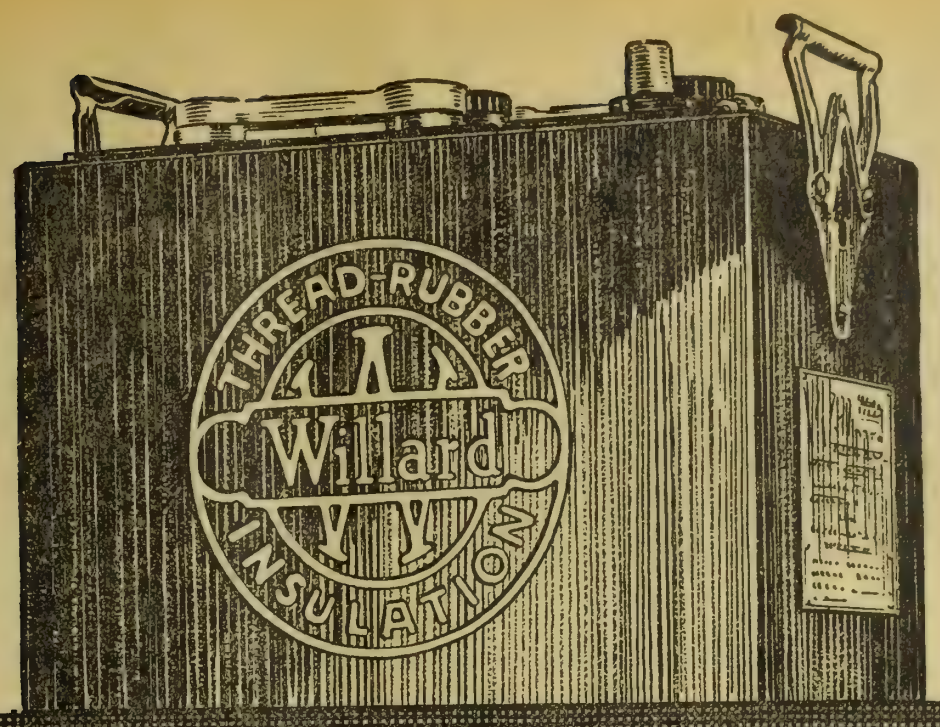
In the Field

H. C. Dunlap, reporting for the field department of the association, considers the market development most timely:

"Our growers, as a result of many months of unsatisfactory market and financial conditions, have become discouraged. Of course, this is very natural for the past season has amounted to a crisis for most of us. The crop of 1920 was produced at the peak of production expense and sold in a large way at the low ebb of the first break. We are now selling to a legitimate trade and the market is founded on a consumer demand which we certainly expect to maintain.

"Our association has recently completed merchandising and advertising plans for the fall and winter season. We are undertaking again this year intensive local campaigns, getting close to the consumer in intimate advertising features and specialty work in the retail trade. This form of campaign was demonstrated to be sound and extremely useful during the past winter and spring.

"Speculative money is not at all Continued on Page 187.)



The Thread-Rubber trade-mark tells you that the plates in your battery are *insulated*—not merely *separated*. Willard Threaded Rubber Batteries are selected by the best brains in the automobile business as standard equipment for 185 makes of cars and trucks.

Manufacturers of 185 cars and trucks have paid the additional price for Threaded Rubber Insulation to assure the users of their product the lowest battery cost per mile of uninterrupted service.

You can buy the Willard Threaded Rubber Battery of any of the dealers in your territory listed below. They all give authorized Willard Service:

THREADED RUBBER BATTERY

Save Loss of Lug Boxes

On August 1 the new California trademark act, which prohibits the misuse of lug boxes used in the fruit growing and canning industry, became effective. Canners assert that the misappropriation of these boxes, which cost from 30 to 40 cents each, has brought about losses of thousands of dollars every year. An investigator for the Canners League of California recently found a crew of Chinamen operating in a large basement in the San Francisco produce district, their method being to pick up canners lug boxes wherever possible, plane off the names stenciled on the ends and sides and sell the boxes as new. All over the produce markets and in all the growing districts of the state for years lug boxes have been used for purposes other than intended, and many peddlers, junk dealers, etc., have made large, illegitimate profits thereby.

Under the new law owners of lug boxes can register with the county clerk the wording or design stenciled on the boxes and publish notice of registration once each week for three weeks in a newspaper. Having given this formal notice to the public covering ownership of the boxes, the burden of proof rests on the possessor of the boxes as to his right to have them or to use them for any purpose other than that permitted in writing by the owner. It is also unlawful for any person to deface such boxes or to remove the marks. A contract which passes between a fruit grower and a canner gives written permission to the grower to use the canner's boxes, but only for the handling of canner's fruit from the orchard to the packing house.

Under the act, according to the interpretation of leading attorneys, peace officers have the right, without special warrant, to arrest any person who has possession of these boxes without written permission of the owner in the same manner that peace officers can arrest a violator of the traffic law or other criminal acts, without special warrant.

Aside from a penalty of 50 cents per box for each box misappropriated, the law provides for prison terms for offenders who traffic in these boxes.

In addition to lug boxes, the law also covers other containers used by manufacturers or producers in any line, provided proper registration is made.

DAYLIGHT ORCHARD FUMIGATION

R. S. Woglum and M. B. Rounds, in the Journal of Economic Entomology, state:

"The writers have carried on experimental daylight fumigation with liquid hydrocyanic acid from the middle of the active fumigation season in October throughout the winter period. As a result of this work they are convinced that, where practicable, daylight winter fumigation is preferable to night work. At this period the insects are especially difficult to kill on cool nights. Furthermore, the trees are in a dormant condition and can withstand a stronger gas even at temperatures approximating 80 degrees Fahrenheit. Particular attention should be given to the exposure.

"While the data accumulated during the past season shows that an experienced and careful operator with a few tents can, by constant manipulation of dosage and exposure, practice daylight work during the growing season, especially on lemons, with partial success, such practice in preference to night work cannot be recommended at the present time. Experience has proved that fixed dosages and exposures are the safest guides to effective fumigation, and the necessary data have not yet been accumulated to establish this condition for daylight summer and autumn work. In fact, there is considerable doubt if a fixed dosage exposure combination can be developed which is practical under the extreme varieties of daylight weather during the usual fumigation season, a situation which is further emphasized by the widely differing conditions between the hot interior valleys and the cooler, more humid coastal belt."

BROWN ROT OF APRICOTS

In California experiment station bulletin 326 by W. L. Howard and W. T. Horne, a description is given of the brown rot fungus (Sclerotinia cinerea), which affects the ripening fruit and the twigs of the apricot. As the attack on the twigs is considered more serious, particular attention is paid to this phase of the investigation. The twigs become infected through the fungus attacking the withering flowers, and not only are the blossoms and young fruits killed, but also the twigs to a distance of several inches. Based on experiments and observations as to the best method of treating the disease, it is recommended that a thorough cleaning out on all blighted twigs and all rotted fruits be made, followed by thorough spraying. Experiments gave such satisfactory results that it was concluded that apricot blossoms may be effectively protected from brown rot by spraying the trees once before they come into bloom with either lime sulphur or Bordeaux mixture. The best results followed spraying when the buds were considerably swollen, although excellent control was secured by spraying at the time the trees were coming into bloom. No evidence was secured to show that spraying apricot trees before the buds begin to swell affords any protection against the disease.

SAN FRANCISCO HARBOR EXHIBIT

The board of state harbor commissioners is to install an exhibit at the state fair that will give a comprehensive idea of the harbor of San Francisco. The booth will be arranged with panoramic view in the background showing the Sacramento and San Joaquin Valleys and the rivers and waters leading into the Bay of San Francisco. The exhibit also will show two models of vessels, one an old time sailing vessel and the other a modern steel freighter, thus demonstrating the change that is taking place in the system of handling the state's products. There will also be shown about 3,000 feet of film depicting the activity of the harbor beginning with the entrance of the passenger steamer through the Golden Gate, the operation of the Belt Railroad, and the shipping and receiving of merchandise through vessels at the piers.

TRACTOR WHEEL SLIPPAGE

The necessity of giving consideration to the slippage of tractor wheels in determining the efficiency of tractor operation is emphasized by E. S. Patch, a prominent tractor engineer. He considers it a factor even greater than that of the economy of the motor proper.

A driving wheel slippage of 35 per cent means that an almost proportional part of the motor power output is spent in doing work that is useless or worse, and that to maintain a given plowing speed, the motor speed must be increased by a like percentage, and this may carry it beyond a safe value.

RECORD APPLE CROP EXPECTED IN NOVA SCOTIA

There is every indication of a record crop of apples in Nova Scotia this year, reports the American consul at Halifax. Trees showed remarkable bloom. Frost affected the setting of the fruit in only a few districts.

KIRKMAN NURSERIES

Reliable Trees and Vines

For Commercial Orchard and Vineyard Planting

Deliveries made direct from nearest propagating plant. To serve the orchard and vineyard planters of California to the fullest satisfaction and efficiency is our aim. We are gratified to have entrusted to us the future of small orchards as well as the large projects. One acre of Kirkman Trees will draw to us greater future plantings. One California orchard has taken two hundred and fifty thousand of our trees. Another four hundred thousand trees. Another six hundred thousand trees and vines together. They have reservations with us for their next season's plantings. The Ex-Governor of Coahuila, Mexico, named his immense project "El Fresno" in honor of our deliveries of nursery stock. We plan to serve every customer so satisfactorily that his future profits will be assured. Correspondence solicited.

Kirkman Nurseries

Fresno, California

Member of Nurserymen's Bud Selection Association of California

LYE PEELING OF FRUIT

Paring peaches, pears and plums with a knife cuts off and wastes a considerable amount of fruit even with the most careful and skilled paring, and careful paring takes a lot of time. Experts say the fruit next to the skin has the finest flavor, and this part is cut off and thrown away with the skin when a paring knife, however sharp, is used. The use of the paring knife adds unnecessary labor and is far less cleanly than when lye is used. So peel these fruits with lye.

The process of peeling peaches, pears and plums by dipping in hot lye solution is approved by the United States government board of food and drug inspection, which reports that lye peeling has no bad effect on the quality or flavor of the fruit and is not contrary to the requirements of the food and drugs act known as the pure food law. Lye peeling saves time, fruit and trouble, is wholesome, rapid, cleanly and economical.

Dipping in Boiling Lye to Facilitate Peeling

All you need is a good iron kettle big enough to hold plenty of water, a wire basket with side handle preferably, to hold the fruit.

To nine gallons of cold water add half a can of lye and a half ounce of alum. Bring to a boil. Have kettle large enough so that it is not over two-thirds filled with the water—this for safety to prevent splashing of the hot solution when the fruit is plunged into the kettle.

When the mixture is boiling, lower the fruit into the boiling solution in a wire basket container or in a thin but firm cloth such as cheese cloth. For smaller quantities of fruit use four tablespoons lye to one gallon of water with a pinch of alum added.

Let the fruit remain two minutes in the hot lye solution, then put it through two cold water baths to thoroughly remove the lye, and in the second bath of cold water rub off with the hands the small pieces of fruit skins that sometimes persist in clinging to the fruit.

MEXICAN TOMATO CROP

Consul W. E. Chapman at Mazatlan thus reports on the only tomato crop which competes with that of California:

"Tomato growers in the state of Sinaloa, Mexico, exported 923 carloads of tomatoes to the United States during the harvest season which began early in January and ended the latter part of May. There was an average of about 825 crates per carload, the crates averaging about 28 pounds each. There was, therefore, an average of about 23,300 pounds of tomatoes per carload, or a total of 21,455,900 pounds of tomatoes exported to the United States during the tomato season just closed.

"The average gross price paid per crate in United States market was $2.62. The costs of production, freight, etc., totaled about $1.83 per crate, giving a net profit per crate of 79 cents to the growers.

"Nearly all of the tomatoes exported from the state of Sinaloa are marketed west of the Mississippi River, and for that reason, as well as the fact that the harvest begins during the first days of January, this crop is not a serious competitor of the Florida product which is sold in the East, but it is quite impossible for Sinaloa producers to export at a profit ten days after the California and Texas crops begin to flow to the markets. When the harvest of these crops begins the Sinaloa producers are forced to cease operations, no matter what quantity and quality of tomatoes they have on hand, as the freight and customs charges are so high and the selling price so low that they could only operate at a loss. The 94 cars of Sinaloa tomatoes marketed in Texas were shipped before the crop in that state matured."

WINTER AVOCADOS

J. T. Whedon, avocado grower of Yorba Linda, speaks of the exceptionally favorable location afforded in the foothills near Yorba Linda for the production of avocados and calls attention particularly to the advantage of growing winter maturing fruits for commercial orchards. He says: "If you are planting a home orchard you should select trees bearing in the four seasons, spring, summer, fall and winter, so as to give you fruit every day in the year. If you are planting a commercial orchard the great majority of your trees should be winter bearing as the winter is when you get your very best prices.

Florida, with her 18 to 20 years experience, has demonstrated that there are practically no markets in the East for avocados in the summer. As a practical illustration a crate holding 48 avocados was shipped to New York in July, netting $1.25; the same size crate shipped in December netted $36.

ARIZONA'S ALFALFA

Hay conditions in Arizona on August 1, according to U. S. bureau of crop estimates, forecast a crop of about 462,000 tons, compared with 381,000 tons in 1920. This year a large acreage of new alfalfa was planted in the Salt River and Yuma Valleys, which has resulted in an increase of about 15 per cent in the state's acreage. Maricopa County reports 75,000 acres; Graham, 11,000; Yuma, 10,000; Pinal, 4,000; Apache, 3,500; Coconino, 3,000; Yavapai, 5,000; Pima, 4,000; Navajo, 2,500; Cochise, 3,000; and Gila, 1,000 acres. For the United States, the forecast is 83 000,000 tons. This compares with 91,000,000 tons last year, and 86,000,000 tons the five year average production.

THE COMING COTTON CROP

The U. S. bureau of crop estimates forecasts for Arizona a crop of about 47,000 bales. Of this amount 35,000 bales will be of the Pima variety of long staple. Last year Arizona produced 83,000 bales of Pima and 20,000 bales of short staple. For the United States the forecast is 8,203,000 bales, a decline of 230,000 bales during the month. Last year's crop totaled 13,400,000 bales.

Gill
One-piece Piston Rings
appeal to thrifty motorists

because: they mean a saving in gasoline and oil; they prevent carbon and all consequent troubles; they prevent loss of power; they lengthen the life of a motor; and they assure a comforting peace of mind and security of pocketbook. Because Gill Piston Rings do all of those things unfailingly month after month through thousands of miles of the most rigorous service they pay for themselves many, many times over and, as a result, are always asked for by thrifty motorists.

THE GILL MANUFACTURING COMPANY,
8300 South Chicago Avenue, Chicago, Illinois

PACIFIC COAST BRANCHES:

GILL PISTON RING COMPANY,
1522 S. Grand Ave., Los Angeles

GILL PISTON RING COMPANY,
803 Van Ness Ave., San Francisco

GILL PISTON RING COMPANY,
409 Burnside St., West, Portland

GILL PISTON RING COMPANY,
723 Pike St., East, Seattle

Identify the Gill One-Piece Piston Ring by the joint, but do not measure its merit by the joint *alone*.

Gill Service is nation wide. There are more than 2,500 stocks of Gill Piston Rings in the country. Some one of these dealers is located near you to supply you with whatever size you may want and the number you want *when* you want them. If your garage or repairman or accessory dealer doesn't happen to carry Gill One-piece Piston Rings tell him to get them from his jobber or from the nearest of our 39 Branch Offices.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Clearing Water in Swimming Pool

On my grove along the hillside in Orange County I have a swimming pool so designed that the irrigation water is used every two weeks to fill same, the wasted water being used to irrigate my orange trees. Moss quickly grows on the surface, and millions of little black appearing bugs, which I understand develop into mosquitos, appear after the water is about seven days old. This practically prevents use of the pool each second week. The pool is exposed to the sunshine at all times. Is there any mechanical or chemical way of preventing these and at the same time not injuring my trees upon which I am compelled to waste the water. If there is no safe chemical method, what do you think of aerating the surface water continuously by means of a miniature fountain operated by very small electric motor and pump, using the same water over and over? I have been advised that copperas will prevent the growths in the water, but it might prove serious to the orange trees. There must be many pools operating under the same conditions here in Southern California whose owners have solved this problem. If so, I would greatly appreciate hearing in regard to them.—Subscriber, Orange.

The best preventive of the forming of algae and purifier of water is copper sulphate. Add at the rate of one ounce of the chemical to 30,000 gallons, or 4,000 cubic feet, of water. If the water is naturally "hard," that is, has high content of carbonate of lime, slightly more of the copper sulphate will be required. The chemical may be introduced to the reservoir by placing in cloth bags and drawing over the surface of the water, which dissolves and secures partial distribution, or it may be dissolved in a small quantity of water and added through perforated pipe at the inlet. If there are already algae formed in the water this will kill them and they will settle to the bottom, but it may require cleaning to secure clean, attractive appearance. Where water contains large quantity of bacteria and is very impure it is sometimes treated with chloride or hypochlorite of lime, powerful germicides, in either case using about one part of the chemical to 7,000 parts of water, or at the rate of about one pound to 33,000 gallons of water. Presumably this treatment will rid the water of all vegetable matter and in doing so put it in condition where you will not be troubled by the bugs.

Canadian Thistle

I have known farmers along the shore of Lake Michigan going bankrupt trying to fight the Canadian thistle with cultivation, knife, hoe, and paying fines into the county treasury. Where you cut one with a knife today tomorrow three to six sprang up in its place. You have to smother them. Alongside our farm there were nine acres of Canada thistles on a side hill. We named it Canada Thistle Hill, fenced it off and turned sheep on it from the middle of May to the first of July. There was no water on the land and they had their drink from the morning dew. During July and August they were taken to pasture where they could get water and the first of September turned back again. The rankest parts of the thistle were salted. The first season we mowed some grass for the sheep and fed them as there was nothing growing but thistles. In the spring when the frost came out of the ground we sowed clover and red top grass over this land. For six years then it was plowed up. No more Canadian thistle there.

Later I was foreman of a large farm more or less infested with Canada thistles. I hooked up eight head of horses with a line and ran them around in a ricle, tramping the life out of them, even 10 to 12 feet on the outside of the infested spots. This I did on all patches of any size on the farm, generally when the ground was moist enough to pack well, twice in the season. The few that came up through the crust we took a club to and thrashed them right and left about the time they started blooming. On land too sandy to pack we made a pair of wooden tongs and pulled them out by the roots after rains when the ground was good and soft—sometimes roots over three feet long. All patches were seeded to clover the following spring when the frost came out of the ground. Large fields were seeded to clover and one crop of hay taken off them, pastured to sheep, salt scattered on the thistles. On those around buildings, fence corners, sidewalks, rock piles, rocky and brush land we used the club and scattered salt on them. Bear in mind that salt will kill soil also, but eventually it will come back. We had one patch near the barnyard on which we poured all the brine from a pork barrel. It cleaned them out also. In the three years' time I worked on that farm we cleaned out nearly all Canada thistles.—N. M. Beecher, Fair Oaks.

Almond Hulls on Soil

Will you kindly tell me whether quantities of almond hulls will injure or benefit when put onto the soil of an orchard?—Subscriber, Durham.

We can see only benefit in making application of these hulls. Of course there might be a situation such as exceptionally light sandy soil into which the hulls might be plowed and then if not sufficiently irrigated an open porous condition might result in loss of moisture. But this condition is hardly probable. The hulls might not become thoroughly decayed as quickly as a green manure but in a heavy or even ordinary loam soil they should prove beneficial. We believe every opportunity should be taken to apply vegetable matter or humus forming material.

Pruning Blackberries

I am pruning blackberries now. Is it too early? How many years do vines last? My vines are very strong and I am cutting canes to a length of four to five feet; also laterals I headed back. How many canes should be left to a plant?—D. G., Anaheim.

Pruning blackberries is a matter of secondary importance. All sorts of prunings are indulged in and success attained. Crops depend on care given. Trellised berries are usually kept at four or five canes to a plant, four feet long, laterals to one foot. In small lots it is best to pinch all growths off when soft, at proper length, the first year; also every year as far as possible. No use growing wood to cut away. Never prune any deciduous tree or plant while green leaves remain, for they are manufacturing food for next year's crop. Wait until leaves are yellow. Always prune off old canes, for crop is grown on new canes.

Budding Avocados

I have two avocado trees, seedlings, that were budded last spring and buds did not grow. Would like to get someone to bud them again. Please advise me. Do you bud same as in orange trees?—Subscriber, Anaheim.

Avocados are budded in same manner as orange trees. It is yet too early for re-budding. Autumn budding is best and allows buds to lie dormant until spring. Apply to Farm Adviser Wahlberg, Santa Ana, for name of someone who will bud your trees.

Propagating Ornamentals

How early this fall can I root rose cuttings? Please give best method. How can I propagate crepe myrtle? Sowing seeds failed. What is the cause of sunflower leaves turning black in spots?—Subscriber, Corning.

Time is largely dependent upon condition and ofttimes the latter upon climate. The more nearly dormant the wood is the better the per cent of rooting. Do not water rose bushes now. Let them rest. Usually early in November or immediately after first heavy rain (before sap starts) take cuttings from leafless canes about size of lead pencil—not much smaller or much larger. With sharp knife cut to four or five eyes. Place cutting with at least two eyes below top of soil. A box of sharp sand is best but well drained sandy loam without decaying vegetable matter will do. Keep well watered, but not soggy, and keep from sun and wind. Best cover sides and top with cheese cloth or burlap. Leave cuttings that grow until next autmun (one year); dry them off by not watering and plant in permanent place when dormant or nearly so. Crepe myrtle may be propagated in same manner and at same time—when tree is dormant. Spots in sunflower leaves are caused by a fungus. After attack no treatment will stop it, but it seldom is sufficiently serious to be injurious.

Dogs Kill Chickens

I have broken three dogs from killing chickens by taking the chicken which the dog has killed and bringing the feet up over the dogs neck and tying them together. The dog will eat it at first, after the first day he will have enough of the chicken and try to get it off, but let the bones hang on his neck for several days. Only once did I have to put a second chicken on a dog.—E. E. R., Watsonville.

Grape Erinose

I am sending under separate cover some leaves from an infested grape vine. What is the cause and what the remedy?

The grape leaves are afflicted with a very minute mite known as erinose. This mite confines its work to the under surface of the leaves and its activities are responsible for the whitish felt like patches so noticeable on the specimens submitted. Control of the mite is usually easy. A simple application of sulphur such as is used to control mildew is effective, in fact where plenty of sulphur has been used for mildew erinose gives little if any trouble.—F. K. H.

Irrigate 'Cots

Should Moorpark apricot trees be irrigated as soon as the fruit is picked? Would it hurt the trees to delay irrigation until the middle of September? We have had two poor crops. What is necessary to insure good crops?—Subscriber, San Jose.

Many growers follow the practice of pruning soon after the crop is removed, then irrigating very heavily following the cultivation. This induces new growth and heavy setting of fruit producing buds. Then, depending upon the soil and sub-soil conditions, irrigating later if necessary. Bear in mind that in order to secure good plump fruit producing buds sufficient moisture in fall as tree approaches dormant period is essential. Many orchardists make the mistake of assuming that once the crop is off there is no further need of giving attention to tree or soil. This belief is the cause of much barrenness. However, with Moorpark it must be borne in mind that it is often a shy bearer.

"WHAT'S IN A NAME?"

Mr. Nickelpinch: Haven't I given you my name? What more do you want?

His Wife—I want the privilege of signing it to checks that will be honored at the bank.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Damages for Son's Death

My son was killed through the negligence of officers of a tank steamer owned by oil company, upon which he was an engineer. Can I maintain an action, even though the death occurred in Mexican waters?—Subscriber, Watsonville.

Probably an action could be maintained in the courts of Mexico, and it may be possible that an action could be maintained against the vessel itself in the home port of the vessel in the United States. If such action is maintained it would probably be a libel in admiralty.

Waste Irrigation Water

Three ranches lie between an irrigation ditch and a natural wash. The upper ranches discharge waste water into a road gutter bordering a third ranch. This water should run off into a wash, but it chokes up the gutter with silt. Who should be required to keep this gutter open along the ranch of the lower proprietor?—Subscriber, Orange.

Assuming that the lower road gutter of the lower proprietor is an easement over the lands of the lower proprietor, he would have the right to require the upper proprietors to refrain from accumulating silt upon his lands. This would, of course, require the upper proprietors to convey away the silt. If the gutter lies on an open road the lower proprietor could make application to the road supervisor and it would be the duty of such supervisor to require the obstruction to be removed by those who have caused it. In either event it would appear that the upper proprietors are required to keep open the gutter.

Change in Water System

By reason of a change in the water system of a mutual water company I was cut off from my former supply. The water company proposed that I buy a new meter and accept a one inch connection in place of the former two inch connection, which I agreed to do. They billed me for the meter and also the connection. Am I required to pay it?—Subscriber, Escondido.

It would seem that as the company cut off the water themselves and as you formerly had a meter there, which they rendered useless, it would be the duty of the company to supply you with not only the cost of the new connection but also the new meter required. However, if you agreed to pay for this new meter and connection it might be that you would be required so to do.

Federal Farm Loan

Can I borrow money from a farm loan bank on a citrus grove?—Subscriber, Oakland.

Under the operation of the federal loan act money is borrowed from and through the local farm loan association and not directly from the central bank. Money may be borrowed on the security of the citrus grove as well as on any other lands.

Damage from Overflow

Does a neighbor have a right to flood my place with overflow irrigation water? If he does so, is he liable for damages done to my crops and land? My land does not lie in a wash or natural drainage but is merely lower than the neighbor's land.—Subscriber, Ontario.

A case very similar to this has been directly passed upon by the supreme court, in which it was held that each land owner must so use his own land as to not cause injury to the land of his neighbor. One cannot bring water upon his land, accumulate such water thereon, and permit it to overflow upon the land of his neighbor, even though such land does constitute a natural water course. The easement of such natural water course is for the conveyance of water naturally coming upon the upper land and not water artificially produced there. Where one brings a foreign substance on his land he must take care of it and not permit it to cause injury to his neighbor's land. If he does so he may be enjoined from permitting it to overflow and also be held liable for damages that may be caused either to crops or land.

Line Fence

When a line fence is without agreement placed on the line can the party erecting the fence claim all right thereto? Can the other party place wire on his side of the posts?—Subscriber, Compton.

If a fence is erected upon the line or at least recognized as being on the line, it belongs to each of the parties as tenants in common. Either party may repair it and may lawfully enter on the land of the other for that purpose. Under the ruling concerning repairs undoubtedly either party would be entitled to place wire upon his side of the posts, as that would probably aid in making the fence more efficient.

FOREST SERVICE EMPLOYES ASKED TO GIVE UP SMOKING

Realizing the danger of forest fires from burning tobacco, even when used in the woods by the most careful persons, District Forester Redington has called upon the field men of the national forests of the California district to refrain voluntarily from smoking during the next few months of extreme fire danger.

At present the fire situation is very critical. Precipitation has been very low. This, with the prevalence of hot, dry winds and the opening of the deer hunting season within the next few days in several of the coast counties, increases the fire hazard considerably. However, the forest officers are hoping that the great number of users of the national forests will be more careful this year than ever before and that the percentage of man-caused fires may be greatly reduced from the high figure that it has held for the past several years.

A HUBAM ASSOCIATION

Down in Alabama they have an association devoted to the encouragement of Hubam clover culture. They use as their slogan, "The plant originated here." With the aid of the farm bureau Alabama folks recently met in a great picnic and convention in order to discuss Hubam and the disposal of seed. It was stated at the meeting that some farmers had grown Hubam and sold the seed "until their land returns them from $600 to $1,000 per acre."

While Alabama usually has very good rains throughout the growing season, an unusual drouth has prevailed this year. But in spite of this fact in many fields the clover stood from six to seven feet in height at the time of the demonstration. Some of the earliest planted had already been cut and threshed, though the bulk of the acreage was just ready for cutting and in fact was in the best condition for observation and study. The fields which have been cut and threshed have made yields of from five to seven bushels per acre, while many of the best fields are expected to yield at least ten bushels of clean hulled seed per acre.

Since the seed of this clover, when ripe, shatters very easily, the grain binders and corn binders used to harvest the crop have been equipped with pans and canvas aprons to catch the shattered seed.

While 1½ pounds of seed per acre was used in making most of the seedings this year, the growers are convinced that from three to four pounds per acre planted in rows from 30 to 36 inches apart will prove most profitable.

PRETTY MUCH THE SAME

"I'm sorry to see you here," said the friend of a convicted bank embezzler.

"Oh, there isn't much change, after all," said the prisoner, cheerfully.

"No?"

"You see, I had been shut up in a cage and looking through the bars for years before I came here. These bars are just a little thicker, and instead of being brass they are steel."

Agri Intensifies Production

LAND is the Grower's Treasury. By intelligent cultivation and the proper restoration of plant food, a steady stream of dollar dividends can be produced.

The FREE booklet, "Profitable Agriculture" sent on request — tells you how **Agri-Gypsum** accomplishes more for the growers than any other simple fertilizer — and at less cost.

If you are interested in making your land yield more dollars per acre, you'll be interested in this booklet.

The Cultivator Patterns

3630. Boy's Suit.—Cut in 4 sizes: 2, 3, 4 and 5 years. A 4 year size requires 3½ yards of material 27 inches wide. Price 10 cents.

3649. Misses' Dress.—Cut in 3 sizes: 16, 18 and 20 years. An 18 year size requires 4¼ yards of 44 inch material. The width of the skirt at the foot is about 2½ yards. Price 10 cents.

3159. Girl's Dress.—Cut in 4 sizes: 2, 4, 6 and 8 years. For a 6 year size 3½ yards of 27 inch material will be required. Price 10 cents.

3633. Ladies' Apron Dress.—Cut in 4 sizes: Small, 34-36; Medium, 38-40; Large, 42-44, and Extra Large, 46-48 inches bust measure. A Medium size will require 5¼ yards of 36 inch material. To make the small apron illustrated will require 1½ yards. The width of the skirt at the foot is about 2 yards. Price 10 cents.

3645. Child's Dress.—Cut in 4 sizes: 2, 4, 6 and 8 years. A 4 year size requires 2 yards of 36 inch material. Price 10 cents.

3638-3417. A Stylish Gown for Stout Figures.—Waist 3638 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3417 cut in 7 sizes: 24, 26, 28, 30, 32, 34 and 36 inches waist measure. The width of the skirt at the foot is about 54 inches. To make the dress for a 40 inch size will require 5¾ yards of figured and 2¼ yards of plain material 27 inches wide. TWO separate patterns, 10 cents FOR EACH pattern.

3644. Girl's Dress.—Cut in 4 sizes: 8, 10, 12 and 14 years. A 12 year size requires 5¼ yards of 27 inch material. Price 10 cents.

3636. Ladies' Work Dress.—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 6½ yards of 36 inch material. The width of the skirt at the foot is about 2¼ yards. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS: we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Fall and Winter 1921 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker.

A WASHDAY LYRIC

I sing the song of a day in spring,
When the rainbow suds foam high,
When round the shed the swallows sing
And the vine's new tendrils creep and cling,
And a gay breeze gambols by;
My thought is swift as the swallow's wing,
And work is pleasure, for love is king,
And I rub and sozzle and rinse and wring,
And the wind is right to dry.

There's a crown of gold on the mountain's crest
And a dream of blue in the sky,
The knoll is green in its summer vest,
And the wind blows free from the boundless west,
While the great sun shines on high.
The wood bird sings to his fairy nest,
And I join his song as I work with zest,
For my clothes are white as his snowy breast,
And the wind is right to dry.

The day is perfect for wind and sun;
And who is so blythe as I?
For the tree is white where the clothes lines run,
Its blossoms are falling, one by one,
Like stars in the grass they lie.
The housewife's week is well begun,
The world is brighter for duty done,
And rest is sweeter when hardly won,
And the wind is right to dry.
—Claribel W. Avery in Farmer's Wife.

HINTS FROM HOUSEKEEPERS

Date Salad

One-half pound (or more) dates. Pour boiling water over them and stir while coming to boiling point. Dry in oven or on towel, stone and cut each date into five or six pieces. Boil ½ cup sugar and ½ cup boiling water. Add juice of 1 lemon and 1 tablespoon gelatine that has been soaked in ¼ cup of cold water. Cool and add dates and three sliced bananas or other fruit. Put in molds and when set serve on lettuce leaves with a spoonful of salad dressing. The best of all dates is the dry, or usually so-called Bread, date grown in the Coachella Valley. The boiling in water results in a delicious moist date.—Mrs. S. V. C.

Canning Quinces

To can quinces, pare and cut into desired pieces. Put into a fireless cooker utensil, add enough water so you can just see it, also the desired amount of sugar and place in the cooker for an hour or longer. Reheat and can. The fruit is well colored and penetrated with the syrup. This is a shorter operation than the usual one and far superior.—E. S. C.

Canning String Beans

In the Cultivator of July 23 I see subscriber from McFarland asks for recipe for canning string beans. I am sending my recipe which I think is far superior to any way I have read of and less work. Beans canned this way will keep well and are just as green and fresh as the ones just out of the garden. No need of any acid or brine nor do you have to blanch them. You may also can peas this way but they should be boiled three hours for three days in succession.

We have been a subscriber to the Cultivator for three years and find many useful things. Pick the beans when ready and string and wash well, cut in pieces and pack in jars as tightly as you can and then place in cooker or boiler and fill the jars with just clear cold water (do not put any salt or brine in), let come to boil and exhaust about 40 minutes; then tighten lids on jars and boil until they have cooked two hours. Leave until next day and cook two hours longer and they are ready to put away when cool. I always have boiling water to fill jars before sealing and always tighten lids when I take them out. — Mrs. Geo. S. Hewett, Corning.

* * *

Seeing an inquiry as to how to can string beans, I submit the following:

Prepare as for immediate use fresh string beans. Put on to cook in enough hot water to cover and cook one-half hour. Can hot. I use Mason jars and do not screw caps on tight. I use no salt nor acid.

Have a boiler with false bottom in it and enough water the temperature of the jars on the stove and as jars are filled put them in it. When boiler is full put on tight lid and boil one hour. Remove from boiler while hot, screw caps on tight and set aside to cool.—Subscriber, Gardena.

Dried Figs

Answering inquiry for drying figs a short time ago:

Make a syrup of 1 pound sugar and 1 pint water. Wash fresh ripe figs and put them in the hot syrup. As figs are added they will make juice enough to fill kettle. Let cook one-half hour. Take off stove and let stand in syrup until next day, when boil one-half hour again. Let cool again and boil one-half hour the third day. When cool press out as much juice as possible and put in dryer. Will dry in two or three days in hot weather. I use the same syrup several times. If it gets thin I add another cup of sugar. Most figs do not need much sugar.—Subscriber, Gardena.

HOUSEHOLD QUERIES

Bronzing Powder

Would someone please tell me how to paint the cattails and eucalyptus leaves in different colors.—Subscriber, Dodgeland.

Bronzing powder in many different shades of gold, silver, bronze, pink, blue, etc., may be purchased from any art store with directions for applying. If subscriber cannot find this in her own neighborhood and wishes addresses of firms from whom it may be purchased we will be glad to send them to her on request.

Canned Pears Ferment

Before I start canning pears I wish you would let me know through your columns what is the trouble with my canned pears. About a week after they are put up their juice turns like milk color and the pears turns dark and afterwards ferment. But some do not ferment at all but are unfit to eat. I have the same trouble every year with some jars. I pour the cooked fruit boiling hot in the jars and seal immediately after filling. I have success with the other fruits put up in the same manner.—Subscriber, Santa Maria.

The milky appearance of the pear juice is probably due to the commencement of fermentation. Pears contain less acid than do peaches and most other fruits, so that it is necessary to use more sugar to assure preservation when canning. Still, pears are very easy fruits to keep and we are inclined to lay the blame for the difficulty to the jars, caps, or rubbers used. Sometimes the jar caps are a trifle bent and one does not notice it and these slight indentations let in the air and spoil good fruit and sugar. If the "zinc" tops are used it sometimes happens that there has been a slight corrosion or a slight deposit of metal on the screw part and this roughness also permits entry of air. The safest thing to do is to throw away old tops and purchase new, making sure that the new ones are perfect. Of course new rubbers should be used each year and they must be good ones. Some rubbers offered are so thin and uneven that they are absolutely worthless. Another precaution: No matter how clean the jars may have been when they were put away, it is necessary to give them a thorough scrubbing with hot water, strong soap powder and a good stiff scrubbing brush, paying especial attention to the neck of the jars outside and in.

Lemon Cucumber Pickles

I would like a recipe for lemon cucumbers pickled green, both sour and sweet, if space permits.—Subscriber, Santa Maria.

We hope the subscriber has saved her Cultivators of July 2 and 9. On page 11 of the issue of July 2 she will find the best recipe we have ever found for making crisp cucumber pickles. This is even better for the lemon variety than the ordinary cucumbers (merely because the lemon cucumbers suit our taste better). On page 37 of the issue of July 9 is a good recipe for sweet pickles. The lemon cucumbers are much better if they are picked while still green before they show yellow color. If they can be picked in the morning and pickled immediately while they are fresh and crisp they will be many times better than if allowed to stand a day or two. If it is not possible to put them immediately into the pickle jars from the vines they may be freshened by standing for a short time in cold water. In washing take care not to rub off the tiny spines or bruise the skin in the slightest. It is best to let the water merely run over the cucumbers with considerable force. A bruising of the skin is apt to leave soft spots in the pickles.

Canning Corn—Corn Salad

Have you a recipe for corn salad, the kind you can for winter, also a recipe for canning corn?—A Cultivator Reader.

General directions for canning fruits and vegetables will be found on page 77 of the Cultivator of July 23, and time tables giving exact time for boiling on page 125 of the issue of August 6. In preparing the corn use sweet corn gathered fresh from the field, husk and silk, blanch in boiling water for 10 minutes, chill by plunging in cold water, cut corn from cob, taking care not to cut so close that you get some of the cob; scrape out remainder of corn from cob; proceed with canning according to directions in Cultivator referred to. If subscriber has not preserved these issues we will be glad to send them on request.

We do not quite understand the question about corn salad. Does subscriber mean the lettuce like plant which is sometimes called corn salad? If so this may be canned in the same way as spinach, directions for which will be found in issues above referred to. If by corn salad she means a sort of corn relish, here is a good one: 12 ears corn, 1 cabbage, 3 sweet red peppers, 3 sweet green peppers, 1 quart vinegar, 1 cup sugar, 2 tablespoons mustard, 1 tablespoon salt, 1 tablespoon celery salt. Prepare corn as for canning above, add other ingredients and cook 20 minutes. Pack into sterilized jars and proceed with canning as directed above.

Cucumber Pickles

Please publish in your household column recipe for pickling cucumbers. —Subscriber, Llanada.

See answer to Subscriber, Santa Maria, given on this page.

Dill Pickles

I see you publish different recipes in your paper from time to time and see some call for certain recipes. Do you do this free of charge for the benefit of your readers? If so, I would like to have the recipe for dill pickles. I used to have one but don't just remember the proportion.—Subscriber, Pomona.

Yes, we are glad to print recipes called for by our readers, as it is the purpose of this department to give practical help wherever possible. If this subscriber has saved her Cultivator of July 9 she will find on page 42 very careful directions for making dill pickles.

Cucumber Pickles in Brine

I would like to know through your household queries whether cucumber pickles will keep put down in brine here in California.—Subscriber, Arlington.

Yes, it is the usual custom to keep pickles in brine, then freshen and add vinegar a short time before they are to be used Place fresh cucumbers in brine made in proportion of 1¾ pounds salt to 1 gallon water. Leave in this brine for 2 weeks, pour off and replace with stronger brine made in proportion of 2½ pounds salt per gallon of water. Cucumbers may be held in this until needed for final pickling. Fermentation takes place during storage, the green color fades to an olive green, the acrid flavor disappears, lactic acid is formed from the sugar, and the texture and flavor improve. The cucumbers must be kept submerged in the brine. This can be done with a wooden float. Should softening set in more salt must be added. After fermentation the barrel is closed and stored until needed for use. After fermentation has ended the head of the barrel or crock may be sealed with paraffin. The salt must

be removed by soaking in cold water or by heating in several changes of water to about 120 to 150 degrees Fahrenheit. A teaspoon of alum per gallon of hot water used will make cucumbers more crisp. Several hours' heating are usually necessary to remove the salt. Good cider vinegar should be used. If the salt has been removed by soaking in cold water the vinegar is added to the pickles boiling hot; if it has been removed by heating in water to 120 to 150 degrees Fahrenheit the vinegar is added cold.

Cucumber Pickles

We enjoy your recipes very much and I would like a cucumber pickle recipe not requiring any oil or horseradish roots, so that I can gather cucumbers from my few vines and put in brine (how heavy?) daily until I have enough to pickle, then how to proceed.—Subscriber, Ramona.

See answer to similar query in this department. Cucumber pickles made by this simple recipe can be packed in jars as you pick them, the whole process finished, the jars sealed and put away until you use them. If you prefer the old time brine method you will find directions for treating in this way under "Cucumber Pickles in Brine," in this department.

Crabapple Recipes Wanted

Will someone send in crabapple recipes (other than jelly) worthy of a place in Bergtholdt's book?—Watsonville Subscriber.

Cactus Fruit

Can anyone tell me use for spineless cactus fruit? Have bushels going to waste every year.—Subscriber, Bonsall.

"Romance of the Counties"—"Nearer Home"

Will you please let me know if there is any book known as "The Romance of the Counties of California"? Also, I would like to have a poem written by the Cary sisters, known as "I Am Nearer My Home Today."—Subscriber, Gustine.

We do not find any book under the title of "Romance of the Counties of California," but we do find one by John Habberton, published in 1880 under the title of "Romance of California Life." This is made up of stories of the old days in California, Nevada and other Western states. It was published by Baker, Pratt & Co., New York.

NEARER HOME

By Phoebe Cary

One sweetly solemn thought
Comes to me o'er and o'er.
I am nearer my home today
Than I've ever been before,

Nearer my Father's house
Where the many mansions be,
Nearer the Great White Throne,
Nearer the jasper sea,

Nearer the bound of life
Where we lay our burdens down,
Nearer leaving the cross,
Nearer gaining the crown.

But lying darkly between,
Winding down through the night,
Is the dim and unknown stream
That leads at last to the light.

Closer and closer my steps
Come to the dark abysm,
Closer death to my lips
Presses the awful chrysm.

Father, perfect my trust,
Strengthen the might of my faith,
Let me feel as I would when I stand
On the rock of the shore of death,

Feel as I would when my feet
Are slipping o'er the brink
For it may be I am nearer home,
Nearer now than I think.

Southern Recipes

Will some of the cooks who know the old Southern ways of cooking chicken tell us how to prepare them. Also ways of serving green corn.—Mrs. G. H. B.

THE WOMEN KNOW HOW

That the San Fernando Valley Fair, September 13 to 18, will be a great success can no longer be questioned, for the women of the valley are back of it in the most thoroughly organized department of the fair. I walked into their meeting at Burbank last week and found 150 members of the ten valley clubs in executive session. And for thorough organization and businesslike handling of their share of the work of building a successful fair the meeting was far ahead of any man's meeting I have attended. Chairmen of each department for each of the valley towns had some definite accomplishment to report in the culinary, needlework, art, and plant and flower classes.

Mrs. Harry Huston, the manager of the women's department of the fair, called for entries for the baby show. Fifty entries have already been made from the town of San Fernando alone and the women from the other towns say: "50 isn't many; wait till you see our list and wait till you see our babies."

Hamilton Horse Bassett with his horse show, R. M. O'Neil with his tractor demonstration, and all the rest of the men's departments will have to hustle to keep pace with those women. —Wm. M. Geddes.

MORE GOOD COOKY RECIPES

(Continued from last week.)

Mrs. M. Tuelling, San Joaquin

Two cups sugar, 1 cup shortening, 1 cup milk, 3 or 4 eggs, 2 teaspoons baking powder. Beat yolks and whites separately, stir up as for a cake. Beat sugar and shortening to a cream, then add beaten yolks, then a little milk and a little flour and so on till the milk is all used, then add beaten whites and finish adding the flour. Do not make the dough too stiff as that makes the cookies solid and hard. Cut out as soft as you can handle the dough. Roll out, sprinkle with granulated sugar. Roll sugar in dough. This improves them very much.

Mrs. A. Semler, Sebastopol

One cup butter, 1 cup sugar, 3 eggs, 3 cups flour. Cream butter, sugar and yolks of eggs, add flour and whites of eggs beaten stiff. Roll out thin and cut with cooky cutter. Moisten top with beaten egg (can dilute with little milk or water) and sprinkle with sugar and finely chopped almonds. Bake in moderate oven.

Marie V. Peres, Yountville

Plain Cookies.—Two cups sugar, 4 cups flour, 1 cup butter, 1 teaspoon vanilla, ¾ cup milk, 2 teaspoons baking powder, 2 eggs. Cream butter and sugar, add eggs and flavoring, mix baking powder with one-half flour, alternate with milk, then add remainder of flour. Turn out on floured board. Roll thin, cut, brush with milk and bake quickly.

Mrs. G. H. Brown, Loomis

I am sending a few old time tried and true cooky recipes. I find many good ideas and helps in household department.

Ingredients for cookies need not be creamed as for cake nor need eggs be separately beaten: Two eggs, 3 cups sugar, ½ cup butter, 1 cup sour cream, ½ teaspoon soda, 1 teaspoon baking powder. Flour to roll. Roll thin, use cutter, moderate oven.

Another.—One cup shortening, ½ cup water, 2 cups sugar, 2 eggs. Flour to roll thin. Add to flour 2 teaspoons baking powder. Place in pan so cookies do not touch.

Mrs. A. R. Arnold, Tracy

White Sugar Cookies.—One cup butter, 1½ cups sugar, 1 cup sour milk, 1 teaspoon soda, pinch salt, flavor to taste. Mix into stiff dough, roll thin, cut and bake in quick oven.

H. J. Kitchner, Los Angeles

Grandma's Cookies: 1¼ cups light brown sugar, ½ cup lard (or substitute), 3 eggs, 2 tablespoons cold water, 1 scant teaspoon soda dissolved in water, ½ teaspoon baking powder, nutmeg to flavor, flour to make soft dough to roll. This recipe has been in our family for many years. We think they are fine.

Cost of Inspection to the Dairyman

By G. A. Pfaffman

OF late many individuals and investigating bodies have been dealing with problems pertaining to the milk and dairy interests, in which the question of the cost of operating under the present state dairy law has been a weighty and beclouding factor. Certain dairymen complain of the costly hardship imposed on them by this law. In order to arrive at a clearer solution of this vexatious question the writer has been attempting to conduct an impartial investigation and has arrived at the following results:

The essential requirements of the present law are: The dairyman is compelled to have a milk house in which to store and properly handle his milk. Milk must be cooled to a satisfactory temperature. Milking should be done in a suitable, clean, well drained stable. All utensils are to be thoroughly washed and sterilized. Other requirements that are mostly minor, such as regular cleaning of the barnyard, and the proper arrangement of toilets, chicken coops, hog pens, etc., generally with special regard to distance. These arrangements can be made with little or no expense. Very often no changes are necessary so that in the main these latter requirements need hardly be taken into consideration in relation to cost. The problem would, therefore, seemingly resolve itself into a consideration of the costs of a milk house, washing, sterilization, cooling and stabling. A close study shows that every one of the items, excepting the few minor ones mentioned, are absolutely essential to producing market milk upon a profitable basis, irrespective of the state law.

A milk house is a wonderful, economic feature, far better than handling the milk in one's home or out of the way places, a great convenience in every respect. No dairyman, law or no law, would be without one, once he becomes acquainted with its advantages. In cooling and sterilization the owner saves himself hundreds of dollars a year, far more than the cost, in having no loss from sour and returned milk and being very rarely troubled with complaints from the public as in years past when even the best dairyman in hot weather had considerable trouble before he knew of the science of sanitation and bacterial counts. With reference to the other items of expense, the clean milking shed, rather than a dirty corral, is in itself a profitable appliance. The cows will give more milk, the loss from milk being spilled in the corrals from unruly cows is overcome, and, added to these, is also a cleaner, low bacterial count milk. In other words, a milking shed, which is often cheap to construct, can be classed as an asset. In fact, the milk house, cooling devices and sheds are all assets, and by installing these the owner increases the value of his dairy. So, considering that all the provisions of the dairy law tend to produce better milk, how can there be a legitimate charge made against the dairy laws' operation?

In the case of raw milk, which includes all the above phases, plus the tuberculin testing of cows, we can find a charge which is traceable to the operation of the state dairy law. The charge in this respect can be safely computed upon the following basis: State wide reactors in 1920 were eight per cent. On a basis of 23 cows to a string, an ordinary dairy, we would say there were ten per cent, or two cows, thrown out of the herd. The average cow costing in the neighborhood of $150 would make this $300, and as the animals can usually be disposed of for about half their value, the loss would be then about $150. If the cost of milk production per quart, we will say, between eight and ten cents, or, say, ten cents, and each cow will, on a low average produce eight quarts daily, or 63,560 yearly, for the entire dairy, we find that the yearly cost of the milk would be $6,356, of which $150 would represent a cost of $.0024 per quart, chargeable to the tuberculin testing, as calculated on a state wide basis.

In this connection it may be stated that this can often be considerably reduced if the dairyman is careful and carries out the instructions of the department. For instance, in the city of Long Beach after several years' work the percentage of reactors in 26 herds has been reduced to three per cent and, according to investigation of the state inspector, could have been reduced to one per cent if the owners had complied with the instructions that all animals introduced into the herds between tests must be tested by qualified veterinarians. The above figures do not apply, however, to dealers and speculators in tubercular cattle nor the so-called chance taker, but to the real, honest, well meaning dairyman.

Against this cost of .0024 of a cent a quart for tuberculin testing the owner finds in it a great advantage, as he can use this as a selling point, often netting him two to three cents more a quart. In other words, it is a great monetary advantage, plus also the advantage of having a healthy herd which will aid in giving an increased yield, as well as increasing public confidence and consumption of dairy products.

Considering all the above phases of the dairy law, we find that a strange coincidence has arisen in that a law framed originally to protect the public health has developed into the greatest boon the dairy industry has ever experienced. It may in a sense have been the salvation of the dairy interests. The law not only helped the dairyman solve his own private problem but increased the public confidence, which in the future, when the work becomes more standardized, will work even more to the dairyman's interest. Is it strange that certain associations in dairy countries like New Zealand and Denmark employ their own inspectors and frame rigid rules of their own? Verily it looks as though the California dairyman is getting something for nothing, and it is not surprising that large, high class dairies are employing men acquainted with dairy inspection as superintendents and as business counselors.

As a final summary we must admit that the account of the dairyman to the state dairy law must be placed in the red; in other words, the dairyman, strange as it may have seemed at first glance, is debtor to the law. The wise dairyman realizes this and his attitude is changing. Many of them who professed that they would never change their methods, law or no law, not only welcome the inspectors now, but seek them.

NORTH BAY COUNTIES FAIR

The district across the bay north of San Francisco has joined hands with the Sonoma County Fair Association in promoting this year's fair at Santa Rosa. J. Francis O'Connor, the well known Berkshire breeder, is president of the association, and this assures the livestock men every possible convenience as Mr. O'Connor sees the fair from the exhibitors' point of view.

The new fair grounds at Cotati are adjoining an unloading platform on the main line of railway so there is no cartage nor driving. Straw for bedding is furnished free. The exhibitors' and grooms' tickets admit to all the free shows, horse, motor cycle and auto races.

The fair will be held inside the new speedway on which Eddie Hearne has just broken the world's record for 150 miles, and a large attendance is assured.

The north bay region is a natural stock country. In many portions pasture is green the year around and, though one of the smallest counties of the state, Sonoma County ranks fifth in yield of dairy products.

Pure breds are not numerous in this district and it is a virgin territory for breeders. All exhibitors at last year's fair made sales both at the show and since.

Breeders should not hesitate to take in this fair. It will help them in building up their project and will help you to condition your show animals for the state fair under show conditions. The Santa Rosa show is from August 24 to 28. L. L. Putnam is the secretary and you will receive excellent treatment from all concerned.

1921 GUERNSEY SALES

The average price paid for 1,192 Guernseys sold in 24 sales since late in March is $335.70. The average prices for previous years are: 1915, $262.76; 1918, $330; 1919, $546; 1920, $508. There has been a slight drop in the average price as compared with the previous two years, but an analysis of the facts reveals that there has been no drop in the appreciation of the breed. According to the bureau of labor statistics, in May, 1920 all commodities were 172 per cent higher than the average for 1913. In May, 1921, all commodities were 151 per cent higher than during the year 1913. In other words, in 1920 the dollar had a lower purchasing value than during the pre-war period or during the present time. It is but reasonable to conclude that the drop in the price of Guernseys is largely the result of the returning value of the dollar.

Another factor of great importance is the age of the Guernseys which have been consigned. Breeders have found it more suitable to consign young stock than ever before. An analysis of the consignments in 15 sales held in various parts of the country reveals that 24.8 per cent of the consignments were under one year of age; 17.4 per cent were one year and under 18 months; and 9.3 per cent were over 18 months and under two years. Only 37.6 per cent of the consignments were three years or over. Assuming that no Guernsey females under 18 months of age had been bred, 42.2 per cent of the animals consigned would be unbred females. Over 50 per cent of the consignments were under two years of age.

Taking all these facts into consideration the average price received for Guernseys in 1921 sales is but little, if any, lower than the average prices received in the years 1919 and 1920.

BEMMERLY HEREFORD SALE

On Wednesday, October 19, W. J. Bemmerly's herd of registered Herefords will be auctioned on the Bemmerly ranch near Woodland, Yolo County. There is probably no other herd of Herefords in the entire West so widely known to the cattlemen as this same Bemmerly herd. Its influence in the development of the Pacific Coast and Hawaiian Island beef industry has been considerable. Mr. Bemmerly has been a figure in the Western cattle world for a generation. His ability as a breeder and his integrity as a man have endeared him to his host of friends, who will regret as much as he the dispersal of a herd of Herefords it has taken a lifetime to develop.

Get rid of the unprofitable cows in the dairy. The milk scales and Babcock test will point them out.

The most profitable gains are made by the young pigs. It pays to give them a chance to get to market early.

SENSATIONAL DISPERSAL

Bemmerly Registered Hereford Herd

On the Ranch, 10 Miles Northwest of WOODLAND

October 6, Alex Whaley, Tulare.
October 21, Robt. N. Clapp, Nuevo.
November 3, A. W. Morris & Sons, Inc., Woodland.
November 9, Palo Alto Stock Farm, Palo Alto.

Herefords

October 27, Pacific Coast Hereford Breeders' Association, California National Livestock Show, San Francisco.
November 1, J. H. Cazier and Sons, Sacramento.

Shorthorns

October 28, California Shorthorn Breeders' Association, California National Livestock Show, San Francisco.
November 2, W. M. Carruthers, Live Oak.

Overton H. Harris, Missouri, one of the most distinguished Hereford breeders of America, has been visiting a number of the leading herds of this state. It is Harris opinion that the outlook for Hereford cattle in California is very promising, and he expressed enthusiastic surprise in the improvement made in California herds in recent years. Harris expects to visit the California National Livestock Show to be held in San Francisco next October and it is probable that his herd will be represented.

E. Z. Russell, swine expert of the United States department of agriculture was in California last week.

Carnation Stock Farms has purchased the Holstein bull, Pietertje Prospect Colantha, son of the world's champion cow, Segis Pietertje Prospect, from Brentwood Farm and Huntingdon Valley Farm of Pennsylvania, for $50,000. Pietertje Prospect Colantha was sold by the Carnation firm last spring for $27,100 and was repurchased to take the place of the celebrated Carnation King Sylvia that died recently.

The American Farm Bureau Federation's Livestock Marketing Committee of 15 met in Chicago on August 10 to complete plans for launching a market selling agency, the purpose being to establish selling agencies at such markets as are deemed advisable. The members will be bona fide livestock producers, either individuals, partnerships or corporations, also cooperative livestock shipping associations. It is proposed to organize a stocker and feeder concern as a subsidiary corporation to buy and sell stockers for members of the U. S. Livestock Producers, and others. To provide the necessary funds for its operation preferred shares of $25 each will be sold, drawing 8 per cent dividends. Profits above interest on preferred stock will be prorated between buyers and sellers of the stock handled.

According to Secretary Paine of the state fair this year's livestock show will be distinguished by the large number of new exhibitors.

W. S. Guilford, one of the owners of the Butte City Ranch and one of the most popular livestock men of the state, is recovering from a long siege of illness.

Members of the Western Berkshire Congress are planning to hold a "donation sale" at Sacramento during the week of the state fair. For several years this organization has resorted to such sales as a means of financing their operations.

William Briggs, who is establishing one of the high class Hereford herds of California on his ranch near Dixon, is now in the East and it is probable that he will make additional selections for his herd.

Senator B. F. Rush, Suisun, president of the California Shorthorn Breeders' Association, has purchased from the Blackhawk Ranch, Diablo, the red three year old Shorthorn bull, Blackhawk Sultan, a son of Roan Radium and out of Red Lady 39th.

Female livestock imported into Mexico, must now pay a duty of $4.99 (U. S.) per head. Two males to each female are allowed in free of this duty when for breeding purposes. There is also a duty of 50 cents per head for mature cattle and 10 cents per head on young stock sent in for six months' grazing by breeders on our side of the border.

William V. Mong, owner of Your Duroc Farm at Whittier, is taking out a nice bunch to the shows. The herd is headed by My Partner, the Walt's Top Colonel boar, and includes a fine Pathfinder's Likeness sow, a High Pathfinder junior yearling sow and futurity litters by Mammoth Sensation and My Partner.

Arizona sheep men can't understand why the freight rate on wool from Phoenix to Boston is $3.33 a hundred while from Los Angeles to Boston it is $1.66. For the time being they find it necessary to ship their wool to Los Angeles, thence by Panama Canal to the Atlantic.

Santa Anita Rancho reports records: "Blanche Nudine Clothilde Walker, senior three, milk 464.3 pounds, butter 24.11, average test 4.15 seven days. Lady Lilith Walker De Kol, senior two, two months after freshening, milk 492.8 pounds, butter 21.11, seven days, milking 70 pounds a day. Ellen Walker Hartog, senior two, milk 383.3 pounds, butter 21."

E. H. Crabb, chairman of the livestock sanitary board, and president of the Arizona Cattle Growers Association, died July 30 at his home in Flagstaff. Mr. Crabb was one of the best known and most loved of all the cattle men of the state, and his loss will be keenly felt not only among cattle growers but by his business associates and acquaintances throughout the state.

STATE FAIR DAIRY PRODUCTS EXHIBITS

By Prof. C. L. Roadhouse

Creameries, cheese factories and dairymen are encouraged to enter their products in the state fair dairy products exhibit. Liberal prizes amounting to $1,080 and gold medals are offered by the state agricultural societies to exhibitors of dairy products, including cheddar, California (granular), jack, Swiss and goat cheese and condensed and powdered milk.

Creameries and cheese factory operators are especially urged to send exhibits, since there has been a decreasing number of exhibits in recent years. The Dairy Building at the state fair grounds is equipped with glass enclosed refrigerator rooms, and products will be exhibited with the name of the exhibitor, throughout the ten day period of the fair. Milk and cream samples are to be shipped on August 29, to Director in Charge of Dairy Products, Consumers Ice & Cold Storage Company, Sacramento, and butter and cheese exhibits shipped to arrive in Sacramento on September 2, express prepaid, addressed to Director in Charge of Dairy Products, Dairy Building, State Fair Grounds, Sacramento.

The milk and cream exhibits will be judged by R. J. Posson, U. S. Dairy Division, Salt Lake City, Utah; George H. Hart and C. A. Phillips of the University of California. Butter and cheese exhibits will be judged by C. L. Mitchell, of Los Angeles; S. L. Denning of San Francisco, and G. D. Turnbow of the University of California.

It is hoped that the dairy interests of the state will support the state fair in their effort to give prominence to California dairy products.

BARNESON HOLSTEIN SALE

Col George W. Bell made a nice sale of the milking herd of registered Holsteins on the Barneson ranch near Corcoran on August 10. While almost none of the animals was advance register tested and many of them had pedigrees practically free from red ink there were some nice individuals among them and these were in demand.

The average on 29 head of tuberculin tested cows was $212 and the top of the sale was only $400. The top was the nice young cow, White Lily Pontiac Vale, a granddaughter of King of the Pontiacs. She, with eight more of the best ones, went to the Maxwell Farms at Hollywood. The Hanford branch of the L. A. Creamery purchased a number of good cows as did Sergeant Brothers of Tulare. Col. Bell was on the block and Col. Perkins of Tulare assisted in the ring.

SEVEN DAY RECORDS

The following seven day official records have recently been completed at the Santa Anita Rancho:

Blanche Nudine Clothilde Walker: Age 3 years, 6 months, 14 days. Milk 464.3, fat 19.389, butter 24.11.

Thelma Riverside Walker: Age 3 years, 1 month, 21 days. Milk 443.4, fat 17.484, butter 21.855.

Anoakia Pontiac Beets 2nd: Age 3 years, 19 days. Milk 584.4, fat 16.968, butter 21.21.

Ellen Walker Hartog: Age 2 years, 6 months, 26 days. Milk 383.3, fat 16.780, butter 20.975.

Lady Lilith Walker De Kol: Age 2 years, 8 months, 27 days. Milk 492.8, fat 16.988, butter 21.11.

Anoakia Pontiac Beets 2nd is a half-sister to King Korndyke Pontiac Acme the $41,000 Baldwin herd bull. She has a record of 17.03 pounds of butter in seven days at 20 months of age

---

LET'S COOPERATE MORE IN USE OF FORESTS

Did it ever occur to you cheerful forest lovers that one of your social duties, when you go for a vacation, is to work with the forest service? The service has men stationed at various points to guard the nation's property from fire, to improve the trails and telephone lines, to give information to you and to all who camp in the tall timber. They have other duties, but these are some of them, and there is not a man on the forest but is glad to help you. What do you plan to do in return? Did you ever think of hunting up a ranger or guard, telling him the names of your party (most of the ranger stations have registers on purpose for you to sign if you want to), the number of your machine, the place you want to camp and about how long you propose to stay? None of this is compulsory in a national forest, but if you get into the habit of doing it, several good results are possible. For you, there is information as to good camping places, good water, good fishing or hunting ground; there are maps for the asking, and suggestions for side trips. Better than these, in case something serious happens at home, you can be found.

The National Livestock Exchange, as the initial step in a widespread campaign to eradicate tuberculosis in livestock, announces the appointment of Howard R. Smith of Chicago as livestock commissioner to coordinate and supervise the efforts of member exchanges at the different markets.

Many livestock exchanges throughout the country, realizing the importance of stamping out tuberculosis, have organized sanitary committees and engaged qualified men to cooperate with federal and state authorities in combating this disease.

King Korndyke Pontiac Acme

The Most Promising Young Herd Sire of the Country

He combines in a rare degree conformation, quality type and great long distance production.

His sire, King Korndyke Pontiac 20th, a grandson of King of the Pontiacs out of Miss Valley Mead De Kol Walker, who has twice made 1000 lbs. of butter in 10 months and who holds the world's record for three-year-olds in the 8 months after calving division with 25.15 lbs. of butter in 7 days.

His dam, Miss Aaggie Acme Burke, who holds the world's record for milk in 1920 with 24,338.9 lbs. of milk and 1,034.66 lbs. of butter in 365 days at 2 years of age. At 4 years she made 35.38 lbs. of butter from 726.4 lbs. of milk in 7 days and in 7 months has made 825.68 lbs. of butter from 18,393.1 lbs. of milk. He is backed by three generations of 1000-lb. cows, one of which includes a junior two-year-old. Six of his seven nearest dams average 1105.11 lbs. and his seven nearest dams average 1058.16 lbs. butter in a year.

King Korndyke Pontiac Acme is siring excellent straight typey calves which give promise of proving to be ideal Holsteins

KERN COUNTY BOYS SHOW THE WAY

(Continued from Page 173.)

under the conditions of the first six weeks."

January 15 opened the spring feeding test with 12 pure bred Poland China barrows in a dry feed lot. They were September and October pigs and weighed from 70 to 120 pounds each. Eight of the 12 averaged between 70 and 90 pounds and four averaged about 115 pounds. The details of this test are set forth by Willie Delfine, who writes:

"The feed lot was near a slough of fresh water and so fenced that the hogs could go down into it to drink. The hogs had access to a large self feeder containing ground barley and milo mixed equal parts. Tankage was fed in a separate and smaller feeder. Each morning the hogs were fed all the soaked barley and corn mixture that they would clean up. This supplemented the dry grain mixture in the feeder. The grain was soaked from two to three days. During the last three weeks of the test ground Indian corn was substituted for the milo. The gain was only a little faster with the Indian corn and seemed to make a saving of about .2 of grain per pound gain. The accompanying chart shows the average rate of gain during the 60 day test. It will be noted that hogs weighing 70 pounds at the start gained1.2 pounds per day during the 60 days; those starting at 88 pounds gained an average of 1.7, and those starting at 110 gained 2 pounds per day. The one that started at 123 is not a fair example, since he had an accident which cut down his average gain. We believe the conclusion from the above figures may simply be stated as follows: A small pig has not the frame or capacity to eat as much food and so grow as fast as the large pig, especially in a 60 day test. The larger pig eats more feed and makes a faster gain. However, this would only be true up to a weight of, say, 225 pounds. At the same time it costs a little more to make gains on the pig weighing above 175, as one has to maintain the body as well as get increased gain.

"A trifle less than five pounds of grain was used to make each pound of gain.

"From January 15 to February 18 the 12 head gained 542 pounds. It was 33 days time for eight head and 24 days for four. During this period 2,827 pounds of grain was used, hence taking five pounds of grain to produce a pound of gain during the first stage of the test.

"The second period, from February 18 to March 2, covered a period of 12 days, in which the average gain per hog was 19 pounds, or a total of 224 pounds for the 12 head. A total of 1,163 pounds of grain used during these 12 days produced pork at the rate of 5.2 pounds of grain per pound gain.

"The two week period from March 2 until March 16 made an increase weight of 308 pounds of pork on the 12 hogs at a cost of 1,504 pounds of grain, or an average of a trifle less than five pounds of grain per pound gain.

"The hogs were sold to the Bakersfield Market, March 21, and dressed out 76 per cent. They were taken directly from the feed lot to the slaughter house and killed before shrinking any in live weight. Otherwise they would have dressed an even higher per cent.

"The members of the Boys Agricultural Club draw the following conclusions from the above reported feeding test: The test was carried on very carefully and we believe the conditions made as near ideal as is practical in dry lot feeding. The figures show us that we must, as a general thing, expect our hogs in the dry lot to use an average of five pounds of grain to make a pound of gain, especially so when they are growing shoats and depend wholly on the dry lot feed of dry and soaked grain."

"During the first two weeks, i. e., from September 24 to October 8, it required 535 pounds of ground barley and 300 pounds of ground wheat or 835 pounds of grain and alfalfa pasture to make 253 pounds of gain on the hogs. In other words, it took 3.3 pounds of grain and alfalfa pasture to make a pound of pork.

"The second two weeks of the test, from October 8 to October 22, the hogs ate 1,120 pounds of ground barley, 375 pounds of ground wheat and 11 pounds of tankage, making a total of 1,506 pounds of grain and short alfalfa pasture to grow 363 pounds of increase. During this period they required 4.1 pounds of grain and the short alfalfa pasture to make a pound of gain.

"The third period, October 22 to November 5, the pigs used 1,175 pounds of barley, 150 pounds of wheat, 150 pounds of coconut meal, 10 pounds tankage, making a total of 1,385 pounds of grain. The alfalfa pasture has become very short by this time. The hogs gained 282 pounds during this period, using4.9 pounds of grain per pound of gain. It will be noted that a great deal more grain was used during this period to make a pound of increase than during either the first or second. The explanation is that during the first few weeks the alfalfa was good and the shoats made very economic gains, using it with the grain. Later the alfalfa became shorter and the hogs got very little good from it, and depended on the grain for their total feed. At this stage the hogs were practically in dry lot feeding on account of the shortness of the alfalfa.

"At the close of the first six weeks of the feeding test, 898 pounds of pork had been produced by 3,726 pounds of grain and fair alfalfa pasture for most of the time. These totals figure 4.2 pounds of grain to make a pound of gain under the above conditions.

"The last two weeks of the test, between November 5 and November 19, took 1,225 pounds of grain to make 215 pounds of gain, or 5.7 pounds of grain for each pound gain. During this period the alfalfa was a minus quantity, so the hogs depended entirely on the grain. It was of poor quality and the hogs ate less of it and made poorer gains than the period two weeks earlier with good grain. This two weeks period brings out the fact that poor grain, although cheap, may be the most expensive in the end, since the hogs make markedly poorer gains on it and use more to make a pound of gain.

"It must also be remembered that the older and larger a hog or any animal becomes, the more feed is required for maintenance, and so it becomes more expensive to make a pound of gain.

"We believe that the following general conclusions can be drawn from this feeding test: Good thrifty hogs on alfalfa pasture, gaining and growing at the same time, use from three to four pounds of grain with the alfalfa to make a pound of gain when the rate of gain is 1½ pounds or more per day per pig. When the same hogs are changed from alfalfa and grain to grain alone it requires from four to five pounds of grain to make a pound of gain, depending on the quality of grain and the rapidity of gain. The faster the gain the less the cost of making it, as there is less food used for maintenance during a short period than during a longer one. and so more of the food eaten actually is used in making gain."

POTATOES FOR STOCK FEED

By G. E. Gordon

Cull potatoes make a very satisfactory stock feed. They are sometimes fed to cows with good results, usually fed raw. Potatoes make a very satisfactory hog feed when mixed with grains that are high in protein content. They are often fed with cull beans and make a pretty well balanced ration when so fed.

In feeding to hogs it is desirable to cook them. Sufficient can be cooked to last two or three days. This is usually done by taking a large kettle or boiler or vat of some kind that is convenient and building a fire under it and cooking the potatoes quite thoroughly. Beans are sometimes cooked with the potatoes, and sometimes corn or barley, although there is no advantage in cooking the grain. In fact, it can better be mixed with the potatoes after they have been cooked and cooled. The potatoes should be well salted while they are cooking. The cooked potatoes can then be mixed with whatever grain is being fed and a little water added if desired, and it can be fed as a swill. Potatoes should not make up more than 50 per cent of the ration when fed with grain as they are highly carbonaceous and should be mixed with feeds containing more protein.

Cooked potatoes are sometimes mixed with bran for dairy cows and make quite a satisfactory feed. Potatoes are sometimes used in feeding horses and in this case are usually fed raw in relatively small quantities at a time, although cooked potatoes can be mixed with bran and fed quite satisfactorily as a mash.

LIVESTOCK IN FULL FORCE AT SOUTHERN CALIFORNIA FAIR

The premium list of the Southern California Fair, which is now being circulated, shows a strong increase in livestock premiums in all classes. Especially is there a very attractive increase in the cattle and swine departments and there promises to be a big show in all livestock classes.

The dairy breeds will especially be in evidence with the largest display in the state. The fair is very fortunate in having secured W. H. Standish of Lyons, Ohio, one of the outstanding judges of dairy breeds in the United States, to judge these classes.

The swine department will also show a very lively interest in every class. The Duroc-Jersey futurity show has filled, the Poland-China promotion show has filled, and the very attractive litter specials in both the Berkshire and the Hampshire classes have filled. The junior club boys are on their toes for this fair and about 50 pig club exhibits are expected.

The poultry, goat and rabbit shows will be the largest in the south. Riverside has twice held the world's record for goat exhibits and will repeat with a greater one than ever this fall.

LIVESTOCK INSPECTORS ASSOCIATION

At the recent meeting of the California State Veterinary Medical Associaiton at Fresno an auxilliary association was organized among county livestock inspectors. Dr. J. F. McKenna of Fresno is president; R. S. Christman, secretary-treasurer.

SELECTING POLLED HEREFORD FOR SHOWS

Six official inspectors representing the American Polled Hereford Breeders Association are now on the road selecting cattle for the various sales to be held under the management of the association during the coming fall and winter. These men will visit nearly 100 herds located in various parts of the United States and will meet at the home office at Des Moines, Iowa, late in August to agree upon the cattle to be taken from each herd. The territory has been divided among the six men in a way that will permit of seeing all the herds in a minimum length of time and at the minimum of expense. From the cattle chosen by these inspectors as being typical of the best the breed affords, there will be taken enough to make up the big "Polled Hereford Week" sale at Des Moines in February, 1922, and the "International" sale at the Chicago show on November 30, 1921. It is expected that the quality of stock chosen will be better than ever, this season. Thirteen states are represented in the nominations.

Arizona ranges have been greatly improved by recent rains. The bulk of the small grain crops was harvested under favorable conditions. Yields of barley and wheat were below the average, but the total production was larger than last year, due to the increased acreage.

California Orchardists Helped Design This Plow

PRACTICAL fruit-growers wanted a plow especially adapted to meet their requirements. They made suggestions. Practical plow-makers put those suggestions into effect. And that is why the **John Deere No. 8** has special advantages for orchard plowing.

Reversible Hitch permits setting the plow to either side for close work in throwing either to or from the row. Note the illustration at the right.

Levers can be angled in when the plow is set to either side—they are always within easy reach from the tractor, out of the way of branches and free of the tractor wheels, when turning short.

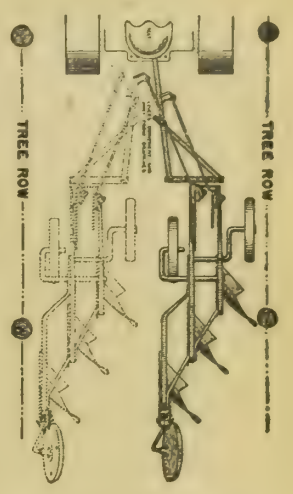
Levers set low when the plow is at work.

Doesn't scar trees—note the wheel base design that permits close work without scarring trees—land wheel set inside line of third beam; furrow wheel set inside line of inner moldboard wing.

Simple, positive power lift—great range of adjustment for deep or shallow plowing; unusual clearance; bottoms that insure good scouring and pulverizing, and strength throughout to stand the strains.

Just the size for small tractors — three ten-inch bottoms—pulls light. Can be reduced to two bottoms by removing one beam, bottom and brace, and using a short connecting rod furnished as an extra.

Write today for a free booklet describing the No. 8 fully. Address John Deere, Moline, Illinois, and ask for Booklet OP-96.



A Feature Every User Appreciates

With the plow set over to throw either to or from the row, the levers can be quickly angled so that they are within easy reach from the tractor seat, out of the way of limbs and free of the wheels when the tractor is turning short.

TURKEYS

Large Number of Choice Bronze Toms and hens, also geese and herding Collie Dogs. Shipped from St. Helena and San Miguel. John G. Mee, San Miguel.

Bourbon Red Turkeys, Buff Orpingtons. The Ferris Ranch, Reservoir Street, Pomona, California.

CONCERNING THE YUCCAS

(Continued from Page 171.)

was due to the higher altitude, but this spring I learned that the Cajon yuccas are mostly of a different variety. Some who read this article may happen to know that I am the dreamer who built Camp Cajon, with its Druidic tables of concrete and its structures of granite boulders. Those who have visited the camp may have noticed two yuccas, apparently growing out of two stone columns. These two plants are set, however, in large vitrified pipes which extend down through the columns to the earth beneath and are filled with soil. They have not been watered, except by rain, since they were set two years ago. A few months ago, when the pergola chalet contributed by the California Auto Trades Association was completed and its grounds were ready for adornment, I decided to plant a solid lawn of yuccas on the sunny south side thereof. When we went to get a truck load of the plants I found that the Cajon variety sends out offshoots or suckers and is apparently capable of reproducing itself indefinitely whether it ever blooms or not. I had noticed the plants growing in clumps and had supposed that a whole podful of seeds had sprouted in a bunch, but found instead that some plants had as many as a dozen offshoots. The variety which I had found growing on my Highland place—and this variety is probably the one which occurs in most localities—never forms offshoots; and consequently, when the single plant blooms and dies it leaves no progeny except through the medium of its seed.

Anyone who fears that the yuccas may become extinct and who wishes to do a public spirited thing may gather enough seed from a single stalk to grow a thousand seedlings; for the pods are packed fuller with the thin, flat black disk like seeds than any can ever was with sardines. When the young plants are a year or two old they may be set, during the rainy season, wherever nature seems to be short of them. Two boys, one of them with a spade, could set out the thousand seedlings in a day and with the confident assurance that, without further attention, they would bloom for their children's delight a quarter of a century later.

For the information of those who have not seen the miracle I should state that when the springtime of the yucca's year of destiny at last arrives, the plant sends up, all within the space of a few weeks, a blossom stalk which sometimes reaches a height of 15 feet and with a diameter at the base as great as six inches. While this stalk is mounting upward it resembles nothing else so much as a giant shoot of asparagus. Soon after I settled on the East Highlands mesa a neighbor's wife told me that the Mexicans (or was it the Indians?) made a practice of cutting these shoots when a foot or so in height and of roasting them in hot ashes as a springtime delicacy. Some time afterward I related to her how I had found one of the shoots in just the right stage and started for the house to get a butcher knife with which to cut it and how, upon returning with the knife, I had found it in bloom. "Well, well! How remarkable!" she courteously replied. But her husband, neither so courteous nor so credulous, snapped out, "How long were you gone?" And I was compelled to confess that when I reached the house I forgot all about the yucca shoot and did not return with the knife for three weeks.

Eastern people—and perhaps some Californians — will be interested to know that these blossom stalks after they are fully matured are cut into short cross sections and used as pin cushions, their soft and sponge like centers being ideal material for that purpose, while the hard exterior of the stalk makes a natural holder for the natural cushion. Sometimes the stalks are distorted in their growth and take strange and fantastic shapes. I once saw one over the mantle in a mountain cottage which had grown in serpentine form; and the mountaineer, obviously a sculptor, had carved the big bulbous base of the stalk in imitation of the head of a giant snake. It goes without saying that it made a striking and startling decoration. I have not yet been able to verify the report that a certain saxophone maker has given an order for a thousand

of these stalks to be grown in the form of the instrument he manufactures, but I have no doubt that it could be done.

For the questionable taste displayed in cutting and carrying the yucca plumes from their natural habitat I have no word of defense; but, really and truly, there is no more danger of extinction of the species than there is of extermination of the hardy, vigorous and beautiful California valley quail which the city sportsmen pursue so relentlessly whenever the game card says the season is open.

PRUNE AND APRICOT GROWERS

(Continued from Page 174.)

plentiful and as a consequence we hardly expect to market all of the crop in the early sale, but with the improvement of export we are looking forward to more continuous business than during the past season. Aside from every consideration of past accomplishment, the association has certainly justified the faith of many good grower members in the firm attitude of our sales department over past year's time. This stand alone is certainly in the largest measure accountable for our present encouragement."

FARM NAMES MAY BE TRADE-MARKED

The United States patent office recently approved a trademark covering the name of an Iowa farm. Ledru C. Willits, the farmer in whose name the trademark was issued, is a breeder of pure bred hogs, cattle and sheep. The name of the farm as trademarked is "Hawkeye." To the knowledge of livestock men in the United States department of agriculture, Mr. Willits is the first stockman, and probably the first farmer, to obtain a United States trademark for his farm. There is nothing in the law to prevent it, but apparently no one thought of it before. If a farmer uses his farm name and trademark as part of his selling operation in disposing of what he produces, the trademark protects him in its use in interstate commerce.

Several states have laws which authorize the registration of farm names with the state authorities, but a trademark registered by the government protects the use of the farm name outside of the state in which the farm is located.

Home Made Vinegar

By W. V. Cruess

GOOD vinegar for home use can be made from grapes, apples, oranges and other sweet fruits. Culls, cores, parings and windfalls can be used as well as dried fruit, raisins and honey.

Preparing the Juice

A sweet liquid is first prepared containing from 10 to 20 per cent of sugar. This is made from the fresh fruit by crushing, heating and pressing out the juice. If the juice is not very sweet one-quarter to one-half pound of sugar should be added to each gallon. The juice of very ripe grapes should be diluted with one or two pints of water per gallon. Honey should be diluted with an equal volume of fruit juice plus five times its volume of water. Dried fruit should be soaked in water (one gallon to two and one-half to three pounds of fruit) 24 hours, then heated and pressed.

Peels and Cores

To peels and cores, add three quarts of water to each quart. Boil a short time. Press and to each gallon of juice add one pound of sugar.

Yeast

The liquid prepared by any of the above methods is placed in a barrel, crock, wooden bucket or large bottle and caused to ferment by adding a cake of well broken up compressed yeast to about each five gallons of liquid. The vessels in which this fermentation takes place should be cleaned and sterilized with hot water and soda and must be free from vinegar. Never use galvanized metal.

The temperature of the fermenting liquid should not fall below 65 degrees Fahrenheit, nor rise above 90 degrees Fahrenheit. The usual house temperature in California is satisfactory. It should be stirred frequently during the first week and in two or three weeks all the sugar should have disappeared.

Adding Starter

It is then drawn or poured carefully off the sediment into a clean barrel, crock or demijohn, inoculated with vinegar bacteria and acidified to prevent injurious bacteria from growing. Both these objects are accomplished by the addition of about one pint of home made or barrel vinegar from the grocery to each gallon of fermented liquid.

Vinegar Fermentation

A wide surface and exposure to the air are necessary for the work of vinegar bacteria. The barrel, therefore, should not be filled more than three-quarters and should be provided with air holes in the heads. Other vessels should not be too deep. All openings should be screened with fine netting or cheesecloth to exclude flies. A film of vinegar bacteria will form on the surface and should not be disturbed by stirring or by moving the vessel.

The higher the temperature up to about 80 degrees Fahrenheit and the more abundant the air supply, the more rapidly the vinegar is formed. Below 60 degrees Fahrenheit the process is very slow. In an ordinary kitchen the temperature is usually favorable. In from two to six months, according to the temperature, the vinegar can be used. It should be drawn off the sediment and put in full, closed barrels or bottles. If cloudy, it can be filtered through several thicknesses of cloth. If placed in full well corked bottles and heated to 150 degrees Fahrenheit for a few minutes it will keep perfectly for years and improves with age.

When the clear vinegar has been drawn from the vessel in which it was made the cloudy vinegar and sediment remaining may be used to start another lot. This is done simply by adding a pint of this liquid to each gallon of fermented juice. Never add vinegar or vinegar sediment to fresh unfermented juice; it kills yeast fermentation. Use yeast only on the fresh, sweet juice.

Black Scale Control

WONDERFUL work has been done in the control of black scale in Ventura County under the direction of Horticultural Commissioner Call and the California state department of agriculture. Even under the complex conditions of city gardens this biological control of our worst scale pest is satisfactorily progressing. Mr. Call has liberated on town lots some 15,000 Aphycus Lounsburyi, and so confident is he of their victorious march that no fumigation of city garden trees will be ordered this year.

The Invading Forces

While the most destructive parasitic or predacious enemy of the black scale is Aphycus Lounsburyi, Rhizobius ventralis, Rhyzobius lopanthae, Orcus chalybeus and others are on the warpath, and their destruction is as fearsome as their names. And they are relentless, for their lives depend upon the destruction of their hosts. The Rhizobius cousins and the Orcus have been with us for many years and have been steadily at work. Doubtless they would have accomplished much more had we earlier learned to keep the ants away, for these pests are a great deterrent to the beneficial activities of all our insect friends. The Aphycus is a later introduction from South Arrica but is now by far the most potent parasite of the black scale.

In company with Horticultural Commissioner Ryan of Los Angeles County, H. M. Armitage, in charge of the state branch insectary at Whittier, and Geo. P. Clements, agricultural agent for the Los Angeles chamber of commerce, the writer made a tour of investigation in the Santa Paula district of Ventura County. Commissioner Call has divided his county into four districts, of which this one is by far the most important in the citrus industry. Last year he caused to be fumigated 246,000 trees throughout the county. This year, by reason of the good work of the beneficial insects, but 50,000 trees, in two districts only, will be so treated. The Aphycus have accomplished more on the Limoneira ranch than elsewhere for here they were first liberated in large quantities, but from this and other points they are spreading rapidly. Commissioner Call reports:

"Aphycus from Limoneira spread south and east about one half mile. Has not had sufficient time for clean-up, but parasites have become established. Three thousand Aphycus liberated on Howell's orchard (West Saticoy) on lower end. Some scale left in this orchard yet. Aphycus spread with wind about three-fourths of a mile to Tucker's orange orchard. This orchard commercially clean now. About one year lapse in time. Rhizobius liberated in orchard of J. M. Sharp. Scale just hatching. Cleaned up about ten acres. Spread through walnut orchard about one-eighth mile. Cleaned up orchard of Harry Pardee, about 15 acres. Approximately 90 days lapse in time."

On the Limoneira ranch there are 85,000 citrus trees. In the past about 65,000 of these have been fumigated annually. This year but 7,000 will be fumigated. This reduction proves the effectiveness of the beneficial insects. Last year the saving on fumigation was $14,000. This shows the value of the work of the state department of agriculture, for in the eight years that Harry S. Smith has had this line of experiments in hand (the biological control of insects infesting citrus trees), the total cost has been less than $50,000. Representatives of this department are now collecting Aphycus in the Limoneira orchards and Commissioner Ryan has one man there. It is estimated that each of the collectors will gather 30,000 insects per day.

1000 Eggs in Every Hen

New System Of Poultry Keeping — Get Dollar A Dozen Eggs—Famous Poultryman

TELLS HOW

"The great trouble with the poultry business has always been that the laying life of a hen was too short" says Henry Trafford, International Poultry Expert and Breeder, for nearly eighteen years Editor of Poultry Success.

The average pullet lays 150 eggs. If kept the second year, she may lay 100 more. Then she goes to market. Yet it has been scientifically established that every pullet is born or hatched with over one thousand minute egg germs in her system—and will lay them on a highly profitable basis over a period of four to six years' time if given proper care.

How to work to get 1,000 eggs from every hen; how to get pullets laying early; how to make the old hens lay like pullets; how to keep up heavy egg production all through cold winter months when eggs are highest; triple egg production; make slacker hens hustle; $5.00 profit from every hen in six winter months. These and many other money making poultry secrets are contained in Mr. Trafford's "1,000 EGG HEN" system of poultry raising, one copy of which will be sent absolutely free to any reader of this paper who keeps six hens or more. Eggs should go to a dollar or more a dozen this winter. This means big profit to the poultry keeper who gets the eggs. Mr. Trafford tells how, if you keep chickens and want them to make money for you, cut out this ad and send it with your name and address to Henry Trafford, Suite 243-A Tyne Bldg., Binghamton, N. Y., and a free copy of "THE 1,000 EGG HEN" will be sent by return mail.

Southern California Egg Laying Contest

By Cornele G. Ross

A SURVEY of the coast and national egg laying contests shows that poultry culturists on the Pacific Coast are taking the lead in the production of high record White Leghorns. At the close of the first egg laying contest held in Western Washington our attention is called to several new records which we will no doubt find hard to equal, viz:

1st. The remarkable flock average of 210½ eggs per bird for the entire 225 birds entered in the contest. 2nd. The winning pen, owned by D. Tancred, Kent, Washington, which laid 1,306 eggs, an average of 261 1/5 eggs in 365 consecutive days. These five birds were the original ones entered, no mortality losses causing the use of any of the alternates. However, the record at Leavenworth, Kansas, for the season of 1918-1919 of 311 eggs by a pen of five White Leghorns appears to still be the real "high water mark." The two high hens at the First Western Washington Contest tied with 312, good shaped, standard sized eggs, thus breaking the American Egg Laying Contest record of 311 eggs. It might be well to bring to the attention of those who believe it necessary for a good utility Leghorn to be possessed of a beefy comb, squirrel tail and coarse type in general the fact that the winning pair at the Western contest, with records of 312 eggs, were of Standard type, good head points, beautiful backs and with tails true to Standard. The winning pen of Leghorns would score 90 points or better without being put in show condition.

Plans for Contest Well Under Way

The contest committee has decided upon the type of house to be used and the contracts have already been let. The shed roof house as recommended by the university will be constructed. The birds will be kept in pens of about 100 each in order to make the contest compare as nearly as possible with the conditions on a good commercial poultry farm. All fowls will be trapnested and with their records will be returned to their owners at the end of the year, October 1, 1922.

There has been more or less misunderstanding, or rather lack of information, in regard to the actual value of some high records made by hens in contests heretofore. As is the case in other contests, eggs exceedingly malformed, soft shelled, or those that weigh less than 18 ounces to the dozen will not be counted or credited to the bird. Another important regulation to be in effect at Pomona is that any bird laying 50 per cent or more eggs weighing less than 22 ounces per dozen during any month after January 1 shall be disqualified for the monthly prize for that particular month, and those laying 50 per cent or more such eggs for six months beginning January 1 shall be disqualified permanently. However, special records of disqualified eggs will be furnished the owner.

In addition to the contest it is planned to conduct some experimental work to make the contest more than simply an official record of the performances of a given number of hens. Features will be included along the line of extension work in order to shed light on the individual problems that confront the poultryman in the particular section where it is to be staged. It is desired to secure 400 White Leghorn pullets for this phase of the work. The committee is asking that the poultrymen donate two pullets to the contest committee to be used for this work. This will aid the committee materially in financing the work and will not make a burden on anyone. Those desiring to donate pullets should make known their wish to one of the committee.

A resident manager has been secured in the person of C. G. Burgess, who is a poultryman of wide experience and has been associated with the poultry division of the University of California farm at Davis. The rules and regulations covering the contest have been adopted and are available in printed form for all interested. Application blanks have also been prepared and both the rules and regulations and the application form may be secured from any of the farm advisors in Southern California counties and from the Poultry Producers of Southern California, 1560 Industrial Street, Los Angeles. Applications should be sent to G. E. Gordon, 361 Court House, Los Angeles.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, August 1, 1921. Report for week ending July 31:

Up to the first of August the 1,000 hens in the tenth egg laying contest at Storrs have produced a grand total of 127,270 eggs. This is 5,678 more eggs than for the six year average. The hens laid 3,486 eggs during the thirty-ninth week or a yield of nearly 50 per cent. This production is 170 eggs less than the six year average.

The first hen in the present contest to lay 200 eggs is a Rhode Island Red, No. 265, owned by F. S. Chapin of Longmeadow, Massachusetts. A pen of Barred Rocks owned by E. C. Foreman, East Lansing, Michigan, won first honors for the week with a yield of 54 eggs. The following shows the average egg production per bird for the several different breeds at the end of the thirty-ninth week: 140 Plymouth Rocks, 115.4 eggs; 50 Wyandottes, 127.8; 270 R. I. Reds, 123.4; 500 Leghorns, 135.6; 40 miscellaneous, 102.1.

The four leading pens in each of the principal varieties are as follows:

Plymouth Rocks

W. H. B. Kent (Barred), 1,603; Rock Rose Farm (Barred), 1,397; Jules F. Francais (Barred Rocks), 1,300; James F. Macdonald (White Rocks), 1,228.

Rhode Island Reds

Charles H. Lane, 1,592; F. S. Chapin, 1,455; H. S. Bickford, 1,453; The Orchards, 1,438.

White Leghorns

L. E. Ingoldsby, 1,655; Hollywood Farm, 1,645; Jack Trevethan, 1,584; Burchell & Janson, 1,568.

Other Varieties

Obed G. Knight (White Wyandottes), 1,758; H. P. Cloyes (Buff Wyandottes), 1,400; A. E. Hampton (Black Leghorns), 1,256; Harry D. Emmons (White Wyandottes), 1,131.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

By Prof. J. E. Dougherty

Santa Cruz, August 8: The end of July found Hansen's pen still in the lead, but George Gray's pen has consistently gained until it is now only 40 eggs behind and has dislodged Hollywood Farm from its position at second place which it held for the two preceding months. Marshall's pen has spurted up to third place, but the greatest gain was made by Alex Stewart's pen of late May hatched pullets which climbed into eighth. The ten leading pens to date are: Hanson's Poultry Farm, Corvallis, Oregon, 1,896 1/3 eggs; Geo. Gray, Santa Cruz, 1,856 2/3; W. H. Marshall, Santa Cruz, 1,856; Hollywood Farm, Hollywood, Washington, 1,844; W. A. Ford, Umatilla, Oregon, 1,836 2/3; S. L. Gibson, Santa Cruz, 1,832 2/3; Gibson, 1,758 1/3; Alex Stewart, Santa Cruz, 1,680 2/3; Santa Barbara Ranch, Santa Barbara, 1,677; Gibson, 1,676.

Twenty-four hens have now passed the 200 mark. Among the high individuals Hollywood hen, "The Leading Lady," retains top place, improving her lead over the second high hen by four eggs. Hanson's hen No. 19 and Conrado's hen No. 104 are running neck and neck in second place, while La Rita Farm's hen No. 54 stepped back to third, closely followed by hen No. 30 of the Oregon Agricultural College. Following are the high individuals to date: Hollywood Farm, 228 eggs; Conrado, 216; Hanson, 216; La Rita, 215; O. A. C., 214; O. A. C. (Barred Rocks), 212; Hollywood Farm, 212; Crewdson, 210; Hollywood Farm, 208; Brenneke, 207; Kenter, 207; Gray, 207.

Among the high pens for July, Geo. Gray, Alex Stewart and S. L. Gibson still hold the three highest places as they did last month but in different order. The leading pens for July are: Geo. Gray, Santa Cruz, 237 2/3 eggs; Alex Stewart, Santa Cruz, 233; S. L. Gibson, Santa Cruz, 230; W. J. Neef, Santa Cruz, 228; Gibson, 225 1/3; W.

H. Ford, Umatilla, Oregon, 222 2/3; C. E. Hyde, Seabright, 219; D. B. Walls, Petaluma, 218 2/3; J. S. Conrado, Santa Cruz, 218; D. B. Walls, Petaluma, 217 1/3; Geo. Wood, Santa Cruz, 215; Warren Wood, Santa Cruz, 213 1/3.

Individual records for July closed with four hens that laid 28 eggs each, two which laid 27 each and ten that laid 26 each. The leading hens for July are: D. B. Walls, 28 eggs; O. A. C. (Barred Rocks), 28; S. L. Gibson, 28; N. C. Westerfield, 28; Walls, 27; Hollywood Farm, 27; C. K. Hale, 26; H. C. Kliensmith (Barred Rocks), 26; O. A. C. (Barred Rocks), 26; C. E. Hyde, 26; O. A. C., 26; Henry Struve, 26; Hanson, 26; W. J. Neef, 26; Alex Stewart, 26; Geo. Gray, 26.

The flock as a whole made an average production of a little over 60 per cent, which represents an average per hen of 18.6 eggs. All birds unless otherwise indicated are S. C. White Leghorns. Fractional figures result from dividing floor eggs by the three entries in each pen.

Barley was substituted for oats in July as the sprouted grain due to the poor quality of the available supply of oats. The approximate feed consumed daily per 100 hens was: Dry grain, 8.08 pounds; barley (sprouted), 4.34 pounds (dry weight); mash, 11.30 pounds, making a total of 23.72 pounds per 100 hens per day or 7.35 pounds per hen per month. The proportion of grain to mash fed both dry and sprouted was increased, resulting in a proportionate decrease in mash consumed.

NATIONAL EGG LAYING CONTEST

By T. W. Noland

Mountain Grove, Missouri: The 300 hens in the Tenth National Egg Laying Contest laid 4,989 eggs during July, or an average of 16.63 eggs per hen. Pen of S. C. White Leghorns owned by D. Tancred, Kent, Washington, won the cup for July by laying 122 eggs during the month. The ten leading pens for July are: S. C. White Leghorns, Washington, 122 eggs; White Wyandottes, Missouri, 119; S. C. White Leghorns, Missouri, 115; R. C. Barred Rhinelanders, Michigan, 111; S. C. White Leghorns, England, 109; S. C. Brown Leghorns, Missouri, 107; S. C. White Leghorns, Missouri, 105; S. C. Anconas, Missouri, 102; S. C. Anconas, Missouri, 101; Barred Rocks, Missouri, 101; Barred Rocks, Missouri, 101.

The ten leading pens to date are: S. C. White Leghorns, Missouri, 1,021 eggs; S. C. White Leghorns, Washington, 1,012; White Wyandottes, Missouri, 1,008; S. C. White Leghorns, England, 992; R. C. Barred Rhinelanders, Michigan, 934; S. C. White Leghorns, New York, 915; R. I. Whites, Illinois, 887; Anconas, Missouri, 882; S. C. Reds, Colorado, 871; Barred Rocks, Missouri, 870.

Sales value eggs average bird for July, 33 cents. Sales value eggs average bird to date, $4.33. Sales value eggs best pen for July, $2.44. Sales value eggs best pen to date, $33.90. Average price eggs during July, 24 cents per dozen.

ANNUAL POULTRYMEN'S MEETING

The meeting of stockholders of the Poultry Producers of Southern California was recently held in Los Angeles, President G. M. Davidson presiding. State Market Director Harry S. Maddox was present and extended heartiest congratulations to members because of the enterprise and aggressiveness of the management of the association. On the question of increasing the capital stock to $250,000 the vote showed there were 7,515 shares of stock voting, and all, excepting 46 shares in the hands of three members, voted favorably to the increase. As to building to be owned by the association it was stated that the board of directors had purchased site on the southwest corner of Industrial and Mill Streets. This property, 150 by 200, cost $42,500. Preliminary plans indicate a building is contemplated which will cost about as much more.

Several addresses were made in support of the policies of the association and steps taken which will doubtless result in material increase in membership.

Poultry Queries

(Conducted by Jean A. Koethen.)

Precocious Pullets

Three little pullets from prize winning Black Minorca stock were hatched April 7 and laid their first egg July 14 when they were just three months and a week old. These pullets were left motherless when they were ten days old and raised themselves for the most part with access to the wheat stack and all the milk they could drink in addition to greens and whatever else they could forage. Is not this a new record for early laying, and is it due to their breeding or to their feed? —Mrs. A. J. M., Bard.

I do not remember just what the record is for precocious laying, but it could hardly be much less than this. Exercise, green range and milk are ideal factors in the raising of chicks. Mrs. A. J. M. should remember, however, that if they are allowed to continue laying before they have their growth they will be spoiled for producers, at least for this fall. They have had too much protein and too little starch and fat, and they should now be put on a ration that will build frame and put enough fat on it to keep them laying through the fall and winter. Oats and corn are particularly good in such a ration. The oats might be sprouted and fed once a day and cracked corn made two-thirds of their grain ration in the evening. Then a conditioning mash, containing considerable corn meal, should be kept before them. The following formula has been used successfully: Wheat bran, 640 pounds; low grade flour, 200 pounds; ground wheat, 200 pounds; corn meal, 300 pounds; ground milo, 200 pounds; meat scrap, 50 pounds; ground green bone, 75 pounds; charcoal, 35 pounds; salt, 10 pounds. If this seems too complicated for so small a number of pullets, a simpler mixture, consisting of equal parts bran and corn meal, with about five per cent ground bone added, will do very well. Do not put them on a regular laying ration till they have attained their normal growth and are at least five months old. Pullets that lay when they are half grown will never reach their proper size.

Turkey Mother?

Can anyone beat this? I gave my neighbor a turkey hen from my flock to mate to her tom. In due time the hen began to go to the nest regularly every day but she never laid an egg. When she became broody she was given 15 eggs. She hatched 13 poults and has cared for them faithfully ever since.—Mrs. E. L. B., San Diego.

The mother instinct, it seems, is something entirely separate and distinct from reproduction. The question is why did that turkey go broody when she had never laid an egg? Somebody answer.

Sick Turkeys

Last week I lost a turkey hen and now another is sick. There is yellowish or greenish yellow diarrhea with fever toward the end. I have been giving a drop of ipecac night and morning, but with no results. I thought it was blackhead but neither hen has been lame.—Subscriber, Garden Grove.

That yellowish diarrhea indicates cholera rather than blackhead, according to Dr. Salmon's description: "The earliest indication of the disease is a yellow coloration of the urates or that part of the excrement which is excreted by the kidneys. This in health is a pure white, though it is frequently tinted with yellow as a result of other disorders than cholera, and in the later stages of the disease may change to greenish or even a deep green. Very soon after these symptoms appear the bird separates itself from the flock, it no longer stands erect, the feathers are roughened or stand on end, the wings droop, the head is drawn down toward the body

(Continued on Page 191.)

Lowest Prices Ever Quoted

On Titan and International Tractors

EFFECTIVE immediately, we make another big reduction in the prices of Titan and International tractors. These reductions wipe out all former advances and place **Titan and International tractors at the lowest prices at which they have ever been sold.**

International 8-16

$915 [With Special California Equipment]

This price is about one-fourth less than the price at which the 8-16 sold prior to March of this year. The new figure is the lowest at which it was ever sold. The new price includes all the necessary equipment — platform, fenders, governor, belt pulley — features which must be paid for extra on some tractors.

Titan 10-20

$900

This is the lowest price ever quoted on the Titan, considering the equipment now included (formerly sold extra). Up to March of this year the price was $1,200—today it is $900. At this figure the Titan 3-plow tractor is the best value in the farm power field.

The International 15-30 has been reduced to $1,750—lower than it has ever been before. The man who needs a 4-plow tractor cannot find a better investment than the 15-30 at this price. (All prices f. o. b. Chicago.)

Considering quality, power, equipment, and the service which follows every machine, Titan and International tractors at these new low prices are unquestionably the best buy in the tractor market.

As the prices have been made regardless of manufacturing costs, we do not guarantee to maintain them. These prices certainly justify the immediate purchase of a tractor. Put it at the horse-killing work of hot weather plowing, and your fall and winter belt work.

See our tractor dealer for full information on deliveries and terms.

Alfalfa bloom poor and unfavorable. Climatic conditions have cut down the Alfalfa honey crop. Beeswax: Supplies heavy, demand light. Crude wax offered by dealers at 22@27, mostly 25 per lb.

GRAIN AND FEEDS

Grain Exch. price bid August 16:
Corn: Bulk No. 2 Yellow, 1.57½.
Milo: Eastern 1.65.
Bran: Kansas, 25.25.
Barley: Carloads, 1.26¼.

HAY

Alfalfa Growers of California report:

Better demand for alfalfa hay, mentioned in our last letter continued throughout the week. Most of the district offices report a fair volume of local sales at materially better prices than central markets.

Receipts in Los Angeles showed further reduction during the week and grain hay fell off even more. Sales could be increased considerably by giving long credits or agreeing to long drawn out deliveries, but since the only object of growers in selling at present ruinously low prices is to raise money for their immediate wants, they do not show much interest in these offers. The use of alfalfa hay as fertilizer, which up to this year had been confined to a few of the orange districts, is extending rapidly to other sections which have recently absorbed all the damaged and low grade hay available without filling the demand. In addition we were informed that growers in one of the important deciduous fruit districts were considering the use of alfalfa as fertilizer on a large scale and wanted us to take the matter up with them. The Redlands orange district which was one of the first to take up alfalfa hay as fertilizer and therefore has several years experience in the use of it, is now offering $16 a ton grove delivery. Last year as high as $23 was paid there. The government crop report issued last week gives the production of hay in the United States this year as 92 million tons, as against 107 million tons last year.

There were 840 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending August 13, with 60 tons held over.

Prevailing prices last week f. o. b. Los Angeles:

No. 1 Dairy	19.00
Standard Alfalfa	15.00

Quotations by Nichols - Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots: handling and commission must be added to obtain retail prices on new hay:

Mexican Reds	7.40
Red Kidney	9.50
Henderson Bush	4.00
Cranberries	5.50
Bayos	7.50
Blackeyes	6.00

HAY AND FEED

Alfalfa Growers of California state that prevailing prices f. o. b. S. F. are:

No. 1 Dairy	15.00
Standard	14.00

Under date of August 6, A. W. Scott Co. says:

Receipts during the week were 2,353 tons as compared with 2,329 last week. The continued heavy arrivals with the light demand has kept the market in a very sluggish condition and prices have been easier on all grades. It is encouraging to note a little increase in volume in almost all branches of the business. General trading through the country has been a little more active, shipments both for export and coastwise have been a little heavier, and even in the city itself the general movement of business seems to have picked up. The period of severe depression seems to have passed and even those who are unable to move their crops or to handle their stocks of hay or grain seem to be looking forward to an early revival of heavier movement. Building activity is improving daily in San Francisco, and with it the draying and transportation business. Alfalfa continues dull and weak with offerings in excess of the demand. There is not much change in the price, however, as holders seem to prefer keeping their stocks awhile rather than sacrifice below the current figures. Less alfalfa is being ground this year than for several seasons, the extremely dull eastern market interfering severely with the usual movement of alfalfa meal.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of switching, cartage, commission and handling expenses must be added according to conditions)

Wheat Hay, No. 1	15.00@18.00
Wheat Hay, fair grade	13.00@15.00
Tame Oat Hay	12.00@15.00
Wild Oat Hay, new crop	10.00@12.00

Oats: Red Feed, 1.25@1.35.

Corn: California yellow, 1.55@1.60; Eastern yellow, 1.55@1.60; white Egyptian, 2.20@2.30 per cental; California red milo, 2.00@2.10; Eastern red milo, 1.85@1.95; Eastern kafir, 1.75@1.80.

Citrus Markets

Los Angeles, Aug. 17, 1921.

Heavy receipts of Valencias in eastern market centers have caused drop in the price of 25 to 50 cents per box. Nearly 1,000 cars have been leaving California each week. Latest estimates show about 7,000 cars remaining for shipment.

Lemons are still meeting good demand. Eastern stocks are fairly well cleaned up so that the market is clear for new arrivals. Cooler weather generally over the East has somewhat depressed prices. There are 60,000 boxes of foreign lemons on hand for sale within the next 30 days.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 34,841 cars; lemons, 9,775; total, 44,616. To same date last season: Oranges, 27,001; lemons, 6,986; total, 33,987. From Central California to date this season: Oranges, 6,644; lemons, 212; total, 6,856. To same date last season: Oranges, 5,377; lemons, 289; total, 5,666. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 23; total, 284.

CALIFORNIA CATTLEMEN'S MARKET REPORT

During the past week Eastern markets have again advanced an average of one-quarter of a cent. The Chicago market is now paying 9½ cents for the bulk of the steers being received. Information received from the seven largest corn feeding states in the Middle West indicates that comparatively few cattle are being fed this year. The estimate seems to be that about 10 per cent of the normal number of cattle are being fed. During the past three or four days, however, a very strong feeder market has developed at Kansas City, which is a very encouraging indication. Recent sales are reported as bringing 5½ cents for cows f. o. b. ranch and 6½ cents for steers f. o. b. ranch. San Francisco market remains steady. Quite a few contracts are being completed for the delivery of steers at 7½ cents and cows at 6½ cents. First shipments of cattle have begun from Modoc and Lassen Counties, and shipments are increasing from Shasta County. The demand continues strongest for lighter steers, although they must be in prime condition. The average carcass this year is 54 pounds lighter than it was last year. Do not sell half fat cattle, and do not ship on commission.—R. M. Hagen, Secretary.

CALIFORNIA CATTLEMEN'S ASSOCIATION REPORT

San Francisco, Aug. 15, 1921.

Sales of cattle reported during the past week in central California show cows bringing 5 to 5½ cents and steers 6 to 6½ cents f. o. b. ranch. Sales in the northern part of the state are for 4½ to 5 cents for cows and 5½ to 6 cents for steers f. o. b. ranch.

Most of the sales made thus far in the northern part of the state have been heavy cattle, lighter weights having not yet been very largely offered for sale.

Additional information received from southern Oregon confirms previous reports that approximately one-half the normal number of cattle will be marketed from there this fall, the bulk being ready for some time between September 15 and October 1. Reports from Nevada are to the effect that less cattle will be marketed this year than last, beginning about September 15.

In spite of existing shortages of cattle in other states, practically a normal number are being sent to market, which in a large number of cases is seriously depleting, if not completely exhausting, individual herds of cattle. This condition is a result of the banks forcing the liquidation of debts. The result of this, of course, will be an increased shortage of cattle and a considerably higher future market.

Eastern prices continue steady, and the feeder market at Mississippi River points continues to improve. — R. M. Hagen, Secretary.

POULTRY QUERIES

(Continued from Page 189.)

and the general outline of the bird becomes spherical. There is great weakness, the affected bird becomes drowsy and may sink into a deep sleep from which it is impossible to rouse it. The crop is nearly always distended with food and apparently paralyzed and there is in most cases intense thirst. The course of the disease may be rapid or slow in its progress through the flock. It may take all within a few days or the fowls may drop off by twos and threes through a period of several weeks." All authorities agree that the yellow or green diarrhea is a characteristic symptom of cholera, while in blackhead it is whitish. Another reason for believing this is cholera rather than blackhead is that adult turkeys seldom if ever die so quickly with blackhead. With them the progress of the disease is very slow, and they are likely to grow thinner and weaker for several weeks before the end.

The only treatment the poultry division recommends for cholera is a thorough cleaning of the premises and the use of 1/5000 bichloride tablet in the drinking water daily. If possible the birds should be removed to clean ground.

Aspergillosis?

Recently I have lost 36 turkeys ranging in age from three weeks to six months. They have free range on alfalfa and are fed a very little corn. At first they hold their heads back as far as they can, then just starve to death. Inside their crops I find many wart-like growths ranging in size from a pea to a small shot and white in color.—Subscriber, El Centro.

Those white wart like growths may come from mold spores in the corn. Have you examined it carefully to make sure that it is perfectly clean and sweet? Corn is not a good diet for turkeys until they are ready for fattening, and if it has been heated or has in any way become moldy it is certain to cause trouble. Better use rolled or whole barley and bran for the birds over two months old and keep the younger ones on hard boiled egg and rolled oats mixed with an equal amount of cut green alfalfa.

Pendulous Crop

The crops of my young turkeys hang down till they almost touch the ground. The birds are confined in a large lot with growing alfalfa for greens, have whole barley and gyp corn at night, soaked barley in the morning and sour milk at noon, also oyster shells. Could this condition be caused by lack of grit, and is there any cure?—Subscriber, Strathmore.

As you say your soil contains almost no sand or gravel, it may be lack of grit has something to do with the condition of the crops. On a granite soil shell alone is sufficient, because the birds pick up gravel, but where they have no gravel they need grit, and on all soils should have it the first two months. It is safest to mix chick grit with the feed from the first day till the poults are old enough to pick up gravel. Another cause of pendulous crop is occasional overfeeding. If the crop of the little turkey is stuffed as full as it can be just once it is stretched a little. If this happens again, the stretching is increased and before you know it a pendulous crop has resulted. The birds should not be allowed to fill their crops once the first two months. After this age, if they have had grit with every meal, the crop has acquired sufficient strength and elasticity to be filled without stretching. Now all you can do is to bandage it quite firmly, leaving room, of course, for a meal, but not permitting the crop to be filled. I have heard of cases where this treatment worked a cure. It is possible, also if you have the skill, to cut a piece out of the crop and sew up the opening, but not everyone can perform this operation successfully.

Pendulous Crop Again

I have a young turkey whose crop is much enlarged and very soft. This is one of a brood that have made their own way without a mother since they were three weeks old, and I do not think they can have been overfed. This bird seems perfectly healthy otherwise.—Subscriber, San Jose.

You are right in thinking pendulous crop is not a disease. As I explained above, stuffing the crop to the limit even once when the bird is small may stretch it so much that it never quite recovers its normal size. Please note suggestions above as to treatment.

More Turkey Queries

A Whittier subscriber sends the following questions, which I will answer by number:

1. Would a turkey that had been cured of blackhead be suitable for a breeder? 2. My little turkeys take great mouthfuls of clean dust or small clods. What food element are they lacking that makes them do this? 3. My baby turkeys are kept on cement floor with the mother hen in a small coop placed on heavy tar paper which is frequently washed and dried. Clean straw is scattered on floor and in coop at night. Are these conditions favorable? The poults are out on the ground in all pleasant weather. 4. Do turkeys ever contract tuberculosis? 5. Is bone meal in small quantities a suitable ingredient in baby turkeys mash?—Subscriber, Whittier.

1. As the blackhead germ is believed to be always present in the intestines of all turkeys, I do not see why a turkey that has been cured of blackhead would not be as fit a breeder as one that had never been sick, provided, of course, that the cure is complete and the bird shows all signs of vigor. 2. I do not know. Are they supplied with grit in every meal? As baby turkeys do not know how to forage it is best to sprinkle a little chick grit over their food until they are six weeks old, and to keep grit before them in a box or pan as well. If you are satisfied that they do not lack grit, how about greens, which contain sulphur and other mineral elements which are found in the soil. Half of every meal given a baby turkey should be cut greens, preferably alfalfa or onions or onion tops. I should not think of trying to raise turkeys without onions, and they ought to have alfalfa as well. 3. I see no objection to tar paper if it is clean, but should prefer a coop with a wood bottom which can be washed with the hose every day. Cover the bottom with clean dirt or straw after it is dry. Some breeders believe poults should be on the ground in a coop which is moved every day, but in damp weather it is not possible always to have it dry under foot if they are on the ground. A board floor covered with clean dirt or sand or straw would seem to meet all requirements. 4. I never heard of a turkey having tuberculosis, but do not see why they should not contract it if they were with tubercular chickens. As a rule they are less susceptible to most diseases than chickens. 5. Bone meal is excellent in a mash for little turkeys after they are six weeks old, but my experience is that they do just as well on plain bran and rolled barley.

Vent Gleet

What is the cause of vent gleet, and how can it be cured?—Subscriber, Watsonville.

The cause of vent gleet is not fully understood. Undoubtedly it is a real venereal disease of poultry, and it seems to originate with a hen and to be passed on by her to the male and from him to the rest of the flock. This is the treatment suggested: Give 30 grains Epsom salts, and twice a day inject first a 4 per cent solution of cocaine and immediately afterward a solution of nitrate of silver, 4 grains to the ounce. The fifth day commence a small copaiba capsule daily, and inject acetate of lead, 1 drachm to the pint. Feed low and dust any sore places outside with iodoform. Personally, I would rather kill the bird than undertake such a troublesome treatment, for no bird that has ever had this disease is fit for a breeder afterward, and the disease is quite contagious.

Sunflower Seed

Are sunflower seeds beneficial during the molt?—Subscriber, Watsonville.

Sunflower seeds are excellent for molting hens, since they contain a good deal of protein, and may be fed as freely as as is consistent with their cost.

Lice on Turkeys

Will you kindly tell me how to rid young turkeys of lice?—Subscriber, Madera.

Dust over heads, under wings and around vent every week with Buhach insect powder, and you will never have a louse.

Line Breeding

Will you tell me how long chickens can be line bred successfully? I have a heavy laying strain of White Wyandottes, and fertility is very low this year. Is this due to line breeding or to conditions this season?—Subscriber, Santa Paula.

All breeders except perhaps the most expert find it necessary to introduce new blood from time to time, but this must be done very carefully in order not to spoil the qualities for which the stock has been bred. Your best plan would be to go to an experienced breeder of White Wyandottes and ask him to sell you either a male or a couple of hens in which type and color "nick" with the bird or birds you wish to mate. Some prefer to introduce new blood through a male and some through the female line. If line breeding is continued too long, or the birds are too closely inbred, infertility does result, and this is no doubt the reason why eggs from show stock are so often disappointing.

It's the Spray That Does the Work

Southern California no longer needs to experiment with unproved sprays. Fumigation that doesn't get results is denied further credit. Success in combating citricola, black scale and red spiders is best assured by spraying with Balfour, Guthrie & Company materials. Field tests have proved this—let us prove it to YOU.

We will work shoulder to shoulder with Southern California orchardists. We will tackle YOUR problems. Our experts will demonstrate that the right way for you to secure a full harvest of fancy fruit is by spraying now with

B. T. S. 15 pounds TRIUMPH 1½ to 2½ gallons GLUE 1 pound (For citricola and black scale)

Per 200 Gallon Tank

(Patented Formulas)

B. T. S. 10 to 12 pounds TRIUMPH 1 gallon GLUE 1 pound (For red spiders)

Years of constant research and actual field work in California have proved the unchallenged merit of these sprays. They assure you best results at half the cost of fumigation. You can depend upon more fancy fruit to sell at highest prices.

Write or call at our headquarters in the H. W. Hellman Building, Los Angeles. Frank B. Herbert, assistant entomologist and his aides will examine your grove free of charge. They will tell you the right spray to use and how to use it. To get best results, spray today.

WINDMILL PRICES REDUCED

For the second time this year the prices of the Auto-oiled Aermotor have been reduced. We are glad to give our customers the benefit of the lower costs of raw material, and of every other saving which our enormous output enables us to make. At the present low prices of Aermotor goods there is no reason why anyone should postpone buying. You can now buy an 8-foot Auto-oiled Aermotor and heavy 33-foot tower for $92.00 f. o. b. Chicago. Prices of all other sizes are proportionately low. Why climb a tower to oil an old windmill when the self-oiling Aermotor, which runs for a year with one oiling, can be bought at such low prices?

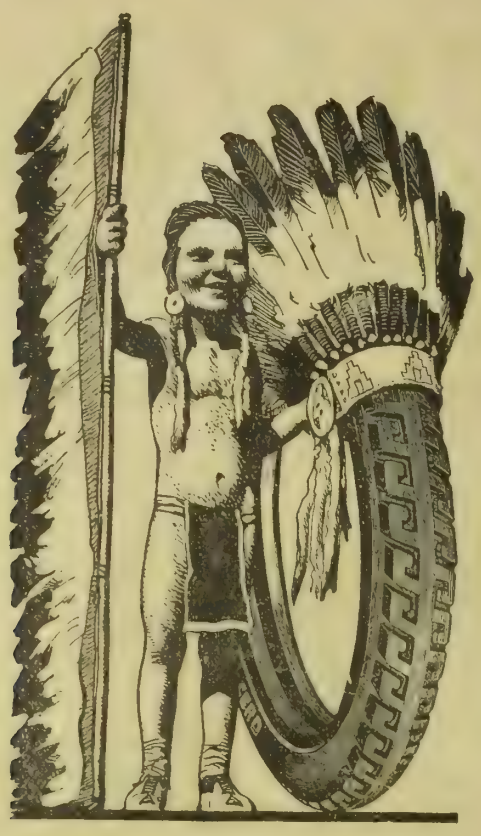
CALIFORNIA STATE FAIR, SACRAMENTO, SEPT. 3-11

Scenes at former state fairs. The larger center picture shows a small section of Thursday morning livestock parade. The Shorthorns and Herefords are in view as the photo is taken. Small upper left photo is of the fireproof Women's Building. The upper center is one of the drafters in full dress. Upper right, entrance to the tractor, machinery and farm implement section. The lower left shows a general view of Horticultural Building from balcony. Lower center, inside of tractor and implement tent. Lower right, amongst the porkers. The state fair begins Saturday, September 3 and continues until September 11.

THE NEW SAVAGE CORD



PRIDE OF THE SAVAGE TRIBE

The mighty Built-to-Excel Savage Cord is the pride of the Savage Tire tribe. Everything that money, skill and determination can do has been done to make this tire the foremost cord tire on the market.

Savage Cord Tires are built to give the greatest possible service to the user, whether he be the owner of a high-powered touring car, a low-priced runabout, or a commercial car; whether their duty be on city streets or to render service to the farmer on country roads. Big, handsome and massive, they provide aristocratic appearance in combination with greater mileage.

Savage Cord Tires are scientifically designed to meet the needs of country road service. They possess greater side-wall strength as a precaution against rut wear. The tread is an ideal non-skid that secures positive traction without "drag" on the road. The bead is unusually strong. And there are from one to two plies of cords more in each size than is the common practice in corresponding sizes of most other makes, which means greater strength and endurance.

The things you want, and should demand, in a tire—economy, reliability, appearance—you get in Savage Cords.

SAVAGE CORDS

give unusual service because unusual materials and methods are used in their construction. Hand built to the smallest detail, they carry two extra plies of special fabric, absolutely pure gum friction cushion and side stock, and a tough, elastic tread.

We guarantee that not an ounce of shoddy or adulterants is used in either casing or tube.

Come to California's Best State Fair

By Chas. W. Paine, Secretary State Agricultural Society

NEARLY every state in the Union boasts a state fair, and while some of the older Eastern state fairs surpass California in point of attendance, number of entries, investment in plant and premium money offered, it can be truthfully said that none are more representative of their state or serve their public more efficiently than does the California state fair.

The directors of the state agricultural society have long proceeded on the assumption that until the California state fair is participated in by every county it will be falling short of the 100 per cent state fair. Accordingly every effort has been made to have each county in the state represented, and it is with the greatest pleasure that we announce that more counties will take an active part this year than in the past. Thirty counties will be represented this year, more than 50 per cent of the 58, so the board feels that this year's show will mark progress toward the aim for a 100 per cent fair.

Chas. W. Paine

The board of directors likewise appreciates the fact that a properly organized and conducted fair presents a splendid opportunity to become an institution of educational value. Consequently advantage is taken of this responsibility and each year has seen a conscientious effort made to attract and effectively stage only such exhibits as are felt will prove of worth to the public of California.

The various county exhibits, reflecting as they do the agricultural and industrial resources of the county exhibiting, afford a striking opportunity to become familiar with the demonstrated and potential wealth of this state. Eastern visitors are unanimous in declaring that these county displays surpass anything seen at the great shows of the country.

The University of California, especially the college of agriculture, the state department of agriculture and the other state departments have, through their splendid exhibits, become distinguished and permanent factors in the success of the fair, and this year the United States department of agriculture has arranged for an extensive exhibit.

Within the past few years the participation of the agricultural implement firms, including the great tractor, truck and automobile concerns, has developed to such notable proportions that the California show is ranked among the best in the United States. The demand for space in that department has touched the highwater mark this year.

Perhaps the department that has shown the most marked growth and has caused the board as high satisfaction as any is the livestock department. The development of the livestock industry in California has been far in advance of our expectations a few years back and nowhere is the growth reflected more accurately than at the state fair. Indeed one of the most pressing problems of the fair management has been to provide room for the expanding entry lists in all divisions. Not only has this growth been confined solely to numbers, the most marked progress being in the quality of the livestock shown.

I do not hesitate to assure the public of a most unusual showing of livestock this year. The showing of the dairy breeds will be up to the usual standard, and that means the best dairy cattle show of the West and, for the first time in the history of the fair, distinguished Oregon herds of Guernseys and Ayrshires will compete with the best of this state.

The division registering the greatest development is the division of beef cattle. Indeed, it is common knowledge that this year's showing will be the strongest yet made in California and will include a number of herds not yet seen in this state.

The swine show will be entirely creditable despite the fact that earlier in the season it was feared this division would be light. More than 50 exhiibtors have applied for space.

The sheep show will be equal in every way to last year's showing, and I am told that the exhibit of milk goats will easily outdistance any yet made in central or northern California.

The draft horse department is expected to reflect the increasing interest now being given this tried and proven source of farm power. Among this year's entries appear several new exhibitors.

One of the popular features of the entire fair has always been the night horse shows, and so enthusiastic has been the support given this feature that the board of directors has left nothing undone to make this year's event even better than former years.

The amusement features of the fair have not been overlooked or overdone; just enough of high class entertainment has been provided to maintain interest without detracting from the dignity and educational value a state fair should have.

The entire board of directors and the management staff have labored since the close of last year's show in an effort to make the 1921 event hold a bigger and more vital part in the agricultural industry of California. How well we have succeeded will be judged by the thousands who will attend, and on behalf of the state agricultural society I extend a hearty and sincere invitation to all readers of the California Cultivator to be our guests.

DAILY EVENTS AT STATE FAIR

SEPTEMBER 3, SATURDAY.—9 a. m.; Gates open; all buildings and stock barns open. Student judging all day. Concert; Stanislaus County Cadet Band, Preston School of Industry Band, Sherman Institute Band.
1 p. m.: Races; Occidental Stake, 2:09 pace, three running races. 3: Free attractions in front of grand stand. Acrobatic acts, trick riding and Bucking Ford "Air Devil" Panghorn in upside-down flying stunts. Concerts.
8 p. m.: Free attractions in front of grand stand. 8:30: Dancing—Noack's Orchestra on lawn pavilion. 9: Fireworks.

SUNDAY.—9 a. m.: All buildings and stock barns open. 10: Band concerts.
1 to 5 p. m.: Band Concerts; Grass Valley Cornish Miners Glee Club. Free attractions in front of grand stand. Airplane stunts.
7:30 p. m.: Free attractions in front of grand stand. 9: Fireworks.

SACRAMENTO DAY—BUSINESS WOMEN'S CLUB DAY.—9 a. m.—Stock Judging; Shorthorn Cattle, Holstein Cattle, Jersey Cattle. Poland China Swine, Berkshire Swine. Band Concerts. 12: Business Women's Club luncheon.
1 p. m.: Races: 2:09 Trot, State Fair Futurity Pace, three running races. Free attractions in front of grand stand (same as Saturday p. m.). Band Concerts.
8: p. m.: California Jersey Breeders Association meeting—Assembly Room. Horse Show. 8:30: Dancing. Boxing contest (free attraction).

TUESDAY.—9 a. m.: Stock Judging; Hereford Cattle, Ayrshire Cattle, Dairy Shorthorn Cattle. Duroc-Jersey Swine, Hampshire Swine. Sheep. Band Concerts.
1 p. m.: Races. Free attractions in front of grand stand (same as on Saturday afternoon). Band Concerts.
8 p. m.: Pacific Coast Hereford Cattle Breeders' Association meeting in Assembly Room. Horse Show. 8:30: Dancing. 9: Fireworks.

WEDNESDAY, BUSINESS MEN'S CLUB DAY.—9 a. m.: Judging of Stock; Draft Horses. Guernsey Cattle, Aberdeen-Angus Cattle. Hampshire Swine. Band Concert. 11: Pure Bred Cattle Breeders' Association under direction of G. H. Hecke, State Director of Agriculture, Assembly Room.
1 p. m.: Races. Free attractions in front of grand stand. Band Concerts. 1:30: Central California Milk Goat Breeders' Association, Assembly Room. 3: California Guernsey Breeders' Association, Assembly Room.
7: California Guernsey Breeders' Association dinner, Assembly Room. 8: Horse Show. Dancing. Band Concerts. 9: Fireworks.

THURSDAY.—GOVERNOR'S DAY.—ROTARY DAY.—10:30 a. m.: Stock Parade. 12: Governor's Reception. Concerts by bands.
1 p. m.: Races. Free attractions in front of grand stand (same as on Saturday afternoon). Band Concerts. 5:30: Rotary Club dinner in Assembly Room.
8: Horse Show. Dancing. Boxing Contests (free attractions).

FRIDAY.—ADMISSION DAY.—FARM BUREAU DAY. — 10 a. m.: Band Concerts. Drill by Boy Scouts. Kennel Club Dog Show. Fruit Growers' Association meeting in Assembly Room, G. H. Hecke, presiding.
1: Races. 3: Athletic Contest—Pacific Coast Invitational Track and Field meet). Band Concerts.
8: Horse Show. Dancing. Fireworks.

SATURDAY. — 10:30 a. m.: Stock Parade. 10: Meeting of California Cattlemen's Association, Assembly Room. Meeting of California Sheriffs' Association. Band Concerts. Dog Show.
1 p. m.: Races. Dog Show. Free attractions in front of grand stand. Band Cencerts.
8: Horse Show. Dancing. Boxing (free atraction).

SUNDAY.—Morning: Band Concerts. Afternoon: Band Concerts. Free attractions in front of grand stand. Evening: Fireworks.

The State Fair

By M. C. Holman

THE big California state fair will soon be in full swing. For weeks chambers of commerce have been packing their choicest fruit; livestock has been fattened and curried; manufacturers whose products are of interest to agriculturists have been preparing suitable exhibits. Every floor has been scrubbed and every corner dusted; the livestock pens have been cleaned and whitewashed; the race track has been scraped and rolled; the big tractor tents have been put up and everything is on the qui vive for the opening.

As an institution of educational value the California state fair ranks high. It brings into one immense area the best of the state's products and is of tremedous inspirational value. Covering an area of 108 acres, it divides itself into a number of special departments each of which would make an exposition in itself.

There are great buildings to house the works of science and of industry, great tents to shelter the implements, vast stretches of pens holding the best animals the state produces and, finally, there is the great race track where thousands gather to watch the ponies scamper over the smooth course or to shudder at the daring feats performed on the turf and in the air.

Those who have found it impossible to visit the state fair in the past should serve themselves to this year's splendid show.

Let us walk within the grounds and get a mental picture of what this exposition will have for those who pass through the gates. Upon entering the fair grounds the flutter of banners, the

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

The cover page and other pages of this issue have reminders of the state fair at Sacramento and of sectional fairs from Shasta to San Diego. The cover page may be considered exclusively a state fair reminder for it shows scenes taken at Sacramento in other years. Along about the middle of September we hope to have some more scenes of this year's fair, "the best ever." We are saying that in advance as we have said after many of the former fairs, for it is perfectly true that each fair affords foundation for the building of a greater and better the next year. Fortunately our fair management is of the type that makes it possible for "the best ever" to continue to enter into the initial sentence of each year's fair account.

* * *

One of the best features of this issue is on the page, or rather pages, devoted to telling why "our county or district fair will be bigger and better than ever." That article is made up of a series of paragraphs written by secretaries or managers of the various fairs, and we trust there is a showing which will attract everybody within reasonable auto distance.

* * *

We think probably every community which will feature a fair this year has already made provision for auto camping parties. Why not load up Lizzie with a lot of tin things, a camp kettle or two, and take the whole family? The trip may be made the occasion of a lot of fun and material addition to the fund of agricultural knowledge, and prove profitable generally.

* * *

The War Finance Corporation announces it has approved an application from an important Southern banking institution for an advance of $5,000,000—to finance cotton, cotton seed cake, peanut cake, and naval stores, for export sale.

* * *

Agricultural Statistician E. E. Kaufman is now serving two masters, and most efficiently. This is made possible through the cooperative agreement between the bureau of crop estimates of the United States department of agriculture and the California department of agriculture, and to the end that this cooperation may be more complete, the office of the agricultural statistician has been transferred from the Custom House, San Francisco, to 1030 K Street, Sacramento. This is headquarters of the state department of agriculture.

* * *

The packer control bill is getting along amazingly by being reported in and reported out and reported sideways. Meantime packer control remains in the hands of the packers.

* * *

Of the nine companies on this continent which sell more than a billion kilowatt hours of electrical energy California has two. Neither of these two is the city of Los Angeles which has been charged with being a great monopoly, and this charge seems to have "stuck" with some farm bureau organizations until they have united in an effort which we believe will discourage cooperative handling of this great and everlasting power. California farmers should rub their eyes open to perceive the fact that their children's heritage is being bartered away while they are being used as a club to discourage the people's ownership of their own. The growth of the great concerns now largely controlling our "white coal" has been almost meteoric, and they must be encouraged, for the people are all too slow to take advantage of their opportunities. But let us not surrender all. We must act and act quickly.

* * *

Since the death of A. T. Currier, charter member, organizer and president from the beginning of the Los Angeles County Mutual Fire Insurance Company, former Senator Prescott F. Cogswell has been elected president of the board of directors.

* * *

These are days of "budgets." Why should not the housewife have her "canning budget"? Many a time has the housewife stood with arms akimbo in front of the canned fruit shelves and said: "Well, I wonder if there is enough jelly, enough preserves, enough jam and canned things?" Now is a good time to start the outline of the budget for next year's canning campaign. Observe month by month the sufficiency of the canned fruit and vegetable closet.

* * *

The Ohio experiment station has discovered that "It took the Roman farmer four and a half days of hard labor to raise a bushel of wheat; the American farmer does it in nine minutes." We would like to remind the experiment station folks that the farmer was not compelled to turn in and spend the rest of his time building battleships. However, we must admit that he had some few scraps of his own to settle in those good old days, so perhaps we must admit that we do things better than did the Romans of Caesar's time. But we do wish our peace makers would acquire some of the efficiency of the American farmer and get more peace at less cost.

AN AGRICULTURAL FAIR IS A GREAT EDUCATIONAL INSTITUTION

A county fair is a show window where the products of a certain section are shown to the public. A fair is as necessary to a county as a show window is to a merchant. In a spirit of friendly rivalry, the progressive ranchers, stockmen, merchants and manufacturers show their best in livestock, horticultural, agricultural and manufactured products. Such an exposition educates the public to the most advanced types, shows the progress that is being made and instills into the mind of the onlooker the desire to go back home and improve on past methods. As an educational institution—along broad lines—the county fair is without a rival.—J. Francis O'Connor.

COMING EVENTS

California Flower and Horticultural Exhibition, Exposition Park, Los Angeles, October 20-26.
Date Festival, Coachella Valley, Oct. 21-23.
California National Livestock Show, San Francisco, Oct. 22-30.
Pacific International Livestock Exposition, Portland, Oregon, Nov. 5-12.
Orange and Olive Exposition, Oroville, middle of November.
Stanislaus County Poultrymen's Association Show, Modesto, Dec. 4-7.

SOME RAISINS

Raisins sure are moving. Here is an Associated Press dispatch from Fresno under date of August 22: "After being photographed from engine to caboose, in which pretty Sun Maids in their famous costumes and Mayor Hart took part, the first shipment of five solid trainloads of raisins which are being rushed east, left over the Santa Fe railroad promptly at 9:30 this morning with a mighty cheer from California Associated Raisin Company officials and hundreds of employes and interested persons who were present to witness the ceremonies attending the first shipment of 15,000 tons of Fresno raisins to Eastern markets."

COOPERATIVE INSURANCE

Cooperative insurance is extending in California. At the recent annual of Farmers Mutuals held in San Jose greater attendance was given and there was more enthusiastic discussion of methods and policies of work than in any preceding year. This is partly due to an act of the last legislature giving greater power to these mutual companies. Heretofore $4,500 has been the extreme limit which one of these companies could take in one risk. The recent enactment, or rather amendment to the former enactment, permits almost unlimited extent in insurance carried by one company, provided it re-insures in other similar institutions all in excess of $6,000. This feature of the new law called for a conference of Southern California Mutuals which was held in Los Angeles last week, and committees were appointed to formulate plans of work, and, so far as possible by the delegates in attendance, the various companies decided to unite and take advantage of this law.

Cooperative insurance is making a great saving to the farmers of California, for the rates usually prevailing are about one-half those of the old line companies. In addition, all cooperation is being strengthened by these companies. There are now about a score of them in the state, the largest being those in Fresno and Los Angeles Counties, each of these carrying around $15,000 of insurance. Practically all of them now have a reserve fund sufficient to meet ordinary losses, and while an assessment is possible on all who become members of the organizations, this is so light when it does come and so seldom comes that it is hardly considered by the members.

For Agricultural Uplift

THIS is the season of agricultural fairs. We have sent request to various fair associations for information as to their exhibits at the state fair and some have replied that all their energies will this year be centered on their own local fairs. We have asked these associations to tell of the special effort to be made this year and give an outline of the real agricultural events and features which are to be particularly noted.

Glenn County Fair, Orland, September 19-24

Glenn County during recent years has been passing through a period of transition. Large areas, previously devoted to grain farming, have given way to the magic touch of irrigation and are bearing crops of all kinds of deciduous and citrus fruits and berries and intensive agricultural crops. The development of pure bred hogs, sheep and cattle has kept pace with the agricultural progress, and the county is now the home of some of the best livestock in the West.

In all this transition the Glenn County fair has played an important part. Conceived in the interest of the community life of the county, presented by men whose unselfish ambition is to promote better agricultural practice, and through it all a higher plain of living, the fair has been one of the most potent factors in the community development, a great public institution dedicated to the service of the citizens.

While providing recreation and pleasure, the basic endeavor is educational; the outstanding mission of the institution has always been for a more intelligent application of the principles of agricultural practice, demonstrated by comparison and promoted by healthy, friendly rivalry.

By sheer force of the results attained the fair has received recognition to an ever widening extent. The ever increasing patronage and the consequent growth of the fair indicate the confidence of the people in the belief that its scope and character makes it a vital help in the development of the agriculture of the country.

State Capitol at Sacramento

Southern California Fair, Riverside, October 11-16

The object and aim of the Southern California Fair is in keeping with traditions and the experiences from which the modern fair has evolved, but while we preserve the traditions of the county fair we attempt to keep abreast of the times in taking advantage of the opportunity which the fair offers for educational work. We believe that the perpetuity and growth of the modern fair lies in the development of its educational possibilities, and to that end we offer the United States department of agriculture, the state department of agriculture, the farm bureau, and every other agency for rural, home or economic education, every advantage within our reach to spread their theories and methods.

We believe that the person who exhibits his productions, placing them side by side with those of his neighbors, benefits by the comparison. The farmer who looks at blooded stock year after year gets something in his blood which will sooner or later result in his discarding the scrub and introducing the pure bred animal into

(Continued on Page 200.)

County Exhibits at the State Fair

AT the state fair the main entrance admits one on the broad passageway leading directly to the main Agricultural and Horticultural Building. On either side are the exhibits of trucks and tractors, education, arts and crafts, then immediately in front of the Agricultural Building is the broad lawn on one side of which are the exhibits of the University of California and dairy appliances; on the other side, the Woman's Building (one of the handsomest structures on the grounds), Poultry Building, and still farther to the left beef cattle, hogs, sheep and goats.

The Agricultural and Horticultural Building is the center of interest for fruit growers of California. Fruits there exhibited have as a rule been in charge of the chambers of commerce of the various counties, and there has been intense rivalry in the making of these exhibits, this in part because each advertises the resources of its county and in part because of the long prizes. These exhibits are more or less spectacular and fine art is often called upon to aid in producing a striking and attractive effect. This has tended in the eyes of some, at least, to make more of the feature and its artistic arrangement than of the real commercial quality of the fruit. However, there are many quality exhibits of commercial packs of various fruits. Those ripening early in the season have been kept under cold storage, and it is not uncommon to see May and June fruits at the state fair.

We have asked, as far as we could learn, the counties which are to exhibit at the coming fair for a statement of the principal feature of their exhibit and the outstanding product of the county which will be given the place of honor. From letters in reply to these requests we have:

Kings County

Kings County is preparing one of the largest exhibits it has ever shown at the state fair, and the principal feature of the exhibit will be the center display stand, which will represent a dining table showing the various agricultural products of the county. On this stand will be exhibited some 30 varieties of peaches, which will be one of the largest peach exhibits shown at the fair, as well as a large variety of grapes, plums, nectarines and apricots.

We are also arranging a large and comprehensive grain exhibit which will occupy one entire side of the exhibit space. Kings County will have approximately some 400 entries of horticultural and agricultural products.

B. B. Price, secretary of the Kings County chamber of commerce, will be in charge.

Sacramento County

The principal feature this year will be a large reproduction of "Sacramento, the Heart of California," worked out in various deciduous fruits surrounded with a pergola containing clusters of grapes.

We also expect to have a very large exhibit of field crops, melons, etc.

San Joaquin County

San Joaquin County will exhibit at the state fair this year and hopes to have a creditable exhibit.

It is intended to feature those products which have helped to put San Joaquin County in fourth place in the list of agricultural counties in the United States, namely, barley, potatoes, beans and grapes.

It is also the intention of the manager to show approximately 100 varieties of fruits and nuts which can be commercially grown in San Joaquin County, as the county offers untold opportunities as a fruit growing district with an abundance of water and ideal transportation facilities.

The Stockton chamber of commerce has arranged with Charles C. Jensen to collect and arrange the exhibit.

Northern California Counties Association

The five northern counties, Shasta, Trinity, Lassen, Modoc and Siskiyou, under the name of the Northern California Counties Association, will exhibit as a unit at the state fair.

The principal feature will be a six window display done in black and white with electric light effects featuring in advertising the wonderful displays to be seen within the exhibit room. The leading features will be a canning display, including an Indian canned dinner by the girls canning clubs of the farm bureau; an individual ranch display depicting the advantages of ranch life in the north; a strawberry plant showing the strawberry plant industry; a special grain and grass display of the Fall River farm center; the mineral wealth of the north.

The outstanding products of special interest to visitors will be the grains and grasses of the five counties, the dairy products, honey. These three are what we are centering on. Approximately 200 varieties of agricultural and horticultural products will be exhibited.

Managers in charge will be Lewis Carrigan, secretary-manager Northern California Counties Association, and R. C. Evans, secretary of the Redding chamber of commerce.

Colusa County

Colusa County will exhibit at the state fair grains and fruit, the former predominating. About 50 varieties of agricultural products will be shown. Our county exhibit this year will be as diversified as it is possible to make it. Barley, rice, wheat and alfalfa will be the main products, although there will be a good showing of fruit and vegetables. W. O. Hyrup in charge.

Tulare County

The Tulare County board of trade will place a county exhibit at the state fair. The county has a space with a frontage of 32 feet and a depth of 19 feet in which will be installed a general collection of fruits, vegetables and agricultural products. Tulare County has such a great diversity of products and they balance so evenly that no one feature will be given prominence above others. We will endeavor, however, to make special features of the deciduous fruits and grapes, citrus fruits and dairy products.

We are unable to give any idea as to the number of products we will have on display for the reason that we are not through collecting and will not know just how many varieties we have until the exhibit is installed.

A. E. Miot, secretary of Tulare County Board of Trade, will have charge of the exhibit.

Fresno County

We have just started the remodeling of our booth and propose to make this one of the most attractive of the county exhibits.

We are not featuring any particular product, but, of course, are specializing on raisins, figs and peaches owing to the large acreage in this territory. We hope to make our exhibit one representative of this section, containing more than 100 distinct varieties of agricultural and farm products.

P. M. Rasmussen, director of exhibits of the Fresno County chamber of commerce, will have entire charge of our exhibit.

Stanislaus County

Stanislaus County will exhibit at the state fair. The features will be livestock, dairy products, agriculture, horticulture, manual training and music (Stanislaus boys band). There will be over 100 agricultural products shown.

The county horticultural commission is in charge.

Alameda County

Alameda County will feature variety of agricultural products, not specializing on any particular one. At least 50 varieties of fruits and vegetables will be shown. Edwin Stearns, secretary of the Alameda County Development Commission, will be in charge.

Mendocino County

Mendocino County will exhibit at the state fair in Sacramento, the principal features of the exhibit being redwood in its natural state, Bartlett pears and apples. Approximately 100 different varieties of agricultural products will be shown. The manager in charge will be Robert Austin.

Agricultural News Notes of the Pacific Coast

Northern California

University of California opened its regular session August 16.

Sutter County cling peaches are now bringing $40 to $45 per ton.

The university farm at Davis reports 500 students in attendance.

Hop picking started in Butte County August 20 with big crop in prospect.

Pork Day will be celebrated October 8 at Redding during the Shasta County fair.

El Dorado County pears and peaches are showing scars from the spring hail storm.

Report comes from Diamond Springs, El Dorado County, that deer are doing considerable damage to trees.

Supervisors of Butte County have adopted by unanimous vote a dry enforcement ordinance for Butte County.

Sebastopol Apple Growers Union is sending out 1,200 boxes of Gravensteins daily from its Santa Rosa packing house.

Growers of cling peaches in Sutter County who have pooled their fruit will pack 7,000 tons of peaches at the Emeryville cannery.

Directors of the National Livestock Show to be held at San Francisco October 22-30 report great interest shown by breeders.

Owners of 1,400 acres of land meeting August 4 at Williams, Colusa County, signed up as a preliminary move toward affiliation with the Glenn-Colusa irrigation district.

The Pacific Portland Cement Company has complained to the railroad commission that railroad freight rates discriminate against its plant at Cement, Contra Costa County.

The California Farm Bureau Elevator Corporation has been receiving since early June an average of ten carloads of grain a day. One day's receipts totaled 31 cars.

Horticultural Commissioner Flournoy of Tehama County reports cleaning up puncture vine throughout his territory and that the railroads have agreed to eradicate the pests on their rights of way.

The California Prune and Apricot Growers Association is operating in Shasta, Tehama, Butte, Yuba, Sutter, Sacramento, Amador, Yolo, Solano, Alameda and Contra Costa Counties of Northern California.

A petition has been presented by Solano County farmers' wives asking for the appointment of a home demonstration agent. The women of Tehama County are also asking for the appointment of an agent.

Hop growers have begun picking. The yards about Sacramento show fine quality of the hops as well as big yields. Twelve to 15 cents is reported contract price for good quality hops. Sacramento growers are paying pickers 90 cents to $1 per hundred pounds.

The Redwood Manufacturers Company of Pittsburg, Contra Costa County, has brought complaint before the railroad commission against the Southern Pacific and Santa Fe railroads, charging excessive rate to Los Angeles and refusal to establish joint rates with the Remco Company, while it is claimed they do joint rates with other water carriers for greater distances.

Central California

Patterson peach growers report cling peach trees overloaded with fruit.

Miller and Lux holdings in the San Joaquin Valley have been placed on the market.

Sweet potatoes are going forward in carload lots from Stanislaus County.

Tulare County has been making arrests for overloading trucks on highways.

A good outlet has been found for Turlock cantaloupes in the San Francisco free market.

The Boys' Corn Club, organized at Bishop, Inyo County, will exhibit at the county fair in October.

The Tulare County Alfalfa Growers Association has been formed as a unit of the Alfalfa Growers of California.

The farmers market is San Francisco is proving a success. It was established one month ago by Santa Clara fruit growers.

One hundred fire fighters have been contending with flames in the Sequoia national forest. 1,800 acres have already been burned over.

Receiving stations of the California Prune and Apricot Growers at Sunnyvale and Los Gatos will soon be equipped with grading facilities.

The recent alien poll tax registration shows that there are more Portuguese in Tulare County than foreigners of any other nationality.

Chester H. Rowell, former editor of the Fresno Republican, will be the speaker of the day at Tulare's celebration of Armistice Day, November 11.

An entire pavilion opening on the lobby of the Tulare County livestock show has been devoted to community exhibits. The show opens September 13.

The California Prune and Apricot Growers is receiving deliveries from Santa Clara County growers at Campbell, Morganhill, Gilroy, San Jose, Mt. View, Los Gatos and Sunnyvale.

San Benito prune and apricot growers are delivering fruit to association houses at Hollister. Tulare, Kings, Fresno, Kern and Madera County deliveries at Hanford, Visalia and Reedley.

Highway Commissioner Whitmore says "California has $1,000,000 ready to spend on approach roads to national parks within the state as soon as the U. S. government does its part on the roads within the parks."

Fresno County has been denied permission to construct a highway grade crossing over the Southern Pacific tracks at Jameson Avenue to connect with White's Bridge road on the grounds that the hazard was too great.

H. B. Keller and F. T. Murphy of the farm adviser's staff of Fresno County have been inspecting grain elevators at Mt. Pellier and Patterson, Stanislaus County. Fresno farmers are looking up the subject to prepare for elevator building themselves another season.

As a part of the campaign of the California Peach and Fig Growers to bring the standard of figs grown in the state to the highest possible plane, the association announced that a dried fig contest would be held in connection with the annual Fig Institute, which will take place early in January at Fresno.

Southern California

Many portable beet dumps are being used in Ventura County.

The Orange County farm bureau is to have a secretary-manager.

The first carload of Bartlett pears left the Yucaipa Valley August 5.

Ventura County's first 1921 beans were red kidneys, threshed August 2.

Rhodes grass has reclaimed many acres once the floor of the Salton Sea.

Ojai, Ventura County, became a city last week by an almost unanimous vote.

Santa Susana, Ventura Conuty, expects to have the best walnut crop in years.

The first cotton of the Palo Verde, Imperial County, crop was ginned August 15.

The last of Imperial Valley's 1921 grape crop of 160 cars was shipped on August 7.

The La Habra chamber of commerce recently held meeting to discuss control of storm waters.

The Yucaipa Valley apple crop will run over a half million boxes and all will be shipped out of the state.

Owing to reduction in freight rates the Imperial Valley lettuce acreage will be fully as great as that of 1920.

Imperial Valley and Palo Verde cotton growers expect to get their cotton picked this year for one cent a pound or less.

Escondido, San Diego County, is buying a ten acre vineyard to raise fruit to distribute free on the annual grape day.

Contract fumigators and sprayers in Los Angeles County operating outside of incorporated cities must secure county licenses.

Banning, Riverside County, reports light olive crop. While the bloom was exceptionally heavy, rain and fog at blossoming time prevented pollenization.

Chris Westgard of Brawley, Imperial County, will soon begin shipping a large crop of pomegranates. This year he planted 1,800 more pomegranate trees.

San Bernardino County has about 50,000 colonies of bees, according to County Inspector Stanley, but this year's honey crop will be the smallest since 1914.

September meetings of Los Angeles County farm bureau centers are announced for Lankershim, September 1; Whittier and San Fernando, 2; Downey and Glendora, 5; Alhambra, 6; Zelzah, 7.

The Imperial Valley's Mariout barley record for 1921 goes to Ralph Butters, whose field yielded 37 sacks to the acre. The next field, in common barley, used as a check, yielded 27 sacks to the acre.

Agents of one of the large steamship companies have been making inspection of the precooling plant at San Dimas with a view to installing in Isthmian steamers the best possible equipment for carrying fruit in perfect condition to Atlantic ports.

San Bernardino County has a new truck ordinance providing "No vehicle of four wheels can operate on county roads which, with its load, weighs more than 22,000 pounds." It is expected that both Riverside and Orange Counties will pass the same ordinance.

The Coast and General

Early sweet potatoes have begun moving from Texas.

Klamath County, Oregon, will hold its fair October 5 to 7.

Sixty per cent of Cuba's 1920-21 sugar crop has been disposed of.

Sugar beet factories of Colorado will begin operations about the middle of September.

The Yuma section of the Arizona state highway will soon be thrown open to traffic.

The state of Washington last year shipped out 21,076 carloads of apples; Oregon, 3,091; Idaho, 2,768.

Salem, Oregon, shipped its first carload of fresh cherries this year. It went to the Atlantic Coast.

Exports of farm products during June were 51 per cent of all commodities exported from the U. S.

A cooperative organization of Western New York apple growers will this year control 5,000 carloads of fruit.

French and Japanese buyers are active in the Australian wool market centers and are reported to have taken all the wool available.

A premium of $57.50 was raised by subscription among Yuma merchants for the first bale of cotton brought to the Yuma gin July 29.

Texas cotton growers get a reduction of 15 cents per hundred on freight rate on compressed cotton to Pacific Coast for export trade.

Georgia watermelon growers have met serious competition from the early Missouri crop and too much rain has also brought them serious losses.

A special mission from the Cuban government has been in Washington appealing for admission of Cuban products to the U. S. on a reciprocal basis.

The Philippine Islands exported during the first five months of 1921 102,270 tons of sugar as compared with 78,168 tons during the corresponding period of 1920.

The Great Northern announces freight reductions of approximately 10 per cent on fresh fruit from Spokane, Walla Walla and Yakima, Washington, to Eastern points.

The Michigan state farm bureau wool pool expects to control 4,000,000 pounds of this year's clip. The Michigan farmers are manufacturing blankets and overcoat fabric from virgin wool.

Japan is encouraging the building up of an iron industry. A law was recently passed providing that any person engaged in the iron industry producing at one place 5,250 metric tons yearly of pigiron or steel is exempt from all taxes for 11 years.

Reports from Georgia show that peach and melon growers are experiencing immediate prosperity from the sale of melon and peach crops. These are moving in fine condition at unusually good prices. Merchantable cantaloupes of choice varieties have taken the place of the indifferent kind.

California shipped out 484 boxes of apples to date of August 6 compared with a total of 365 carloads last year at the same date. It is interesting to note that the early apple box shipments during this same period from all other sections of the U. S. totaled 570 carloads. Barreled apple shipments from eastern states, same period, 1,021 carloads.

Getting Ahead by Going Back---to Livestock

By R. P. Royce

DURING the past year, and continuing to the present time, most lines of industry have been forced to undergo drastic readjustments, and no single industry has been hit harder or at more points than agriculture .

Generally speaking, these readjustments have all tended in the same direction, and in nearly every instance it has been made plain that only those who organize their operations on a sound basis wherein efficiency of production governs can hope to meet the new conditions.

Only the misinformed and shallow optimists expect to see a speedy recovery to the hectic boom days of the war. Only the confirmed and cowardly pessimist believes, for a moment, that the country has gone to the demnition bow-wows. Only the cheerful idiot expects to see all the things he has to sell fetch the high dollar and the commodities he buys purchasable at extreme bottom prices.

The men who are coming through these distressful times are the men who keep their feet on the ground, their courage up and fall in step with the main crowd made up of men who are willing to put greater effort into their work and who are alert to every opportunity.

The situation as regards California agriculture is not different from that found in other states save the fact that on the average we are better off —and don't know it. But the time is close at hand when California ranchers must give serious thought to the type of farming they propose to follow in the future. To imagine that we can continue to conduct our farming operations without regard to a wider use of livestock—efficient livestock—will lead to disaster as surely as daylight follows dark.

The foremost need of California agriculture is the development of a livestock consciousness in the mind of our farming public.

There may be those who will take issue with the above statement, but they have failed to present any argument in refutation.

California has not yet developed an appreciation of livestock in keeping with the progress made in other lines —and until we do, the things we have accomplished, groves and vineyards of which we are justly proud, are as houses built on sand and their periods of productivity are limited to whatever extent a kindly Providence has endowed the soil with native fertility—and be sure of this: No soil is permanently fertile.

For too long have we been inclined to put all our eggs in one basket. Such practice may be profitable for awhile—indeed, it has been profitable in years gone by, but such practice is for the speculator. Speculation has small place in safe farming and from now forward California needs to develop a practice of safe farming, if we don't want to see the entire structure go to pot.

No more convincing demonstration of the weakness of our system need be called to mind than the predicament a host of barley and alfalfa growers are experiencing just now.

Up through our big and little valleys there are thousands of tons of barley and hay for which there is slight demand and when any changes hands the growers declare they sell at a loss. At the same time fat hogs are selling around $10.50 to above $12 per hundred which will net feeders around two cents per pound for barley, and there are so few hogs in California that killers have been shipping in hogs from the Middle West since the first of the year. Is such a situation sound?

In most sections alfalfa is moving slowly and at prices that represent slight if any profit to the grower, while butterfat has stiffened to a point that makes dairying mighty attractive with cheap feeds.

There are, in fact, thousands of ranches in California without a hoof of livestock save the work stock and family cow. Such ranches offer splendid opportunuities for their owners to install a small herd of beef cattle. For the most part the cattle could be carried through on feed that now goes to waste.

But far more important than the actual profits from livestock operations is the maintenance of the soil fertility. The fertility of our soil is California's greatest asset. Indeed, the whole future development of the state is limited to the degree of conservation practiced in soil management and as yet no state or nation has successfully solved the problem of soil fertility without the extensive use of livestock.

Livestock production is not a precarious business. Study the agricultural development of the older states and it will be found that in every case the most prosperous states are states wherein livestock occupies a commanding position. Visit such states and it will be found in turn that the most prosperous communities are livestock centers. Livestock is the great balance wheel of agriculture—the one sure steadying influence alike in time of bumper crops and crop failures. The sane raising and feeding of cattle, sheep and hogs has paid off 90 per cent of the farm mortgages of America and no man ever "went broke" raising and feeding his own crops to good livestock of his own raising. True, men have made failures speculating in livestock—buying to resell at a profit—but the writer has searched his memory and is unable to recall a single case of failure on the part of any man who was content to feed his own crops to cattle or hogs of his own raising. And today—all through the Middle West, and in California, too, men who thought livestock too slow and who took their flyers along other lines are installing a few cows and a few brood sows with the firm conviction that in time they can recoup their losses, and their livestock will not fail them.

In this appeal for a wider use of livestock the writer does not want it understood that he has in mind that every California rancher should estab-

(Continued on Page 214.)

Economic Importance of Dairying in California

By R. A. Condee

IN the past the agricultural importance of the southern counties of California has been measured more by the number of cars of fruit shipped and acreage planted to fruit trees than by the quality or quantity of products from our diversified farms when as a matter of fact the economic importance of the irrigated area of the counties south of the Tehachapi adapted to the production of livestock and general farm crops is very considerable and has been making rapid strides during the past decade.

Southern California is proud of its great citrus and deciduous fruit industry, and the question of maintaining the soil fertility in these groves and orchards will in the next few years be one of the big problems confronting the orchardist. Chemical fertilizers have their place, but every experienced horticulturist knows that humus must be supplied and that nothing has yet been found that will replace barnyard manure in placing the soil in the proper physical condition.

Owners of orchards realize that the supply of this very necessary fertilizer must be in some way increased and that the raising of more livestock in Southern California means more and cheaper fertilizer.

A good many orchardists are casting about for some method by which they can produce their own "barnyard" and at the same time cut down their fertilizer costs by adding to the gross income of their farms. Undoubtedly the dairy cow will eventually supply this want. A well known citrus grower made the statement that "within a few years 20 per cent of the citrus growers of Southern California will be carrying a small herd of from six to 12 dairy cows."

Small herds as a rule produce more per cow than larger ones, therefore the grower will not only supply valuable fertilizer to his grove but will realize an added profit from the cows and add to the supply of a very necessary food.

The dairy herd will help solve the yearly labor problem for the owners of orchards by supplying work for helpers hired on a yearly basis and retaining efficient labor in and out of the fruit season.

The matter of finance is also to be considered as money needed during the fruit harvesting period will not be required, at the time, for the dairy industry. Then again, during the lean years in the orchard the milk checks and sales from the dairy breeding stock will be very acceptable.

The diversification of products is a big item, as specialized farming is proving somewhat unsafe. We have a good example of this in the Imperial Valley sections where cotton replaced alfalfa and the dairy cow a few years ago and as a result brought failure to the farmers.

The man with the enterprise and ability to finance an orchard project on thousand dollar land will not be expected to breed inferior cattle, and more high producing pure breds is sure to result from the addition of dairy cattle to the orchards. Dairy cattle offer possibilities in the citrus and deciduous fruit growing centers.

It would seem superfluous to recommend dairy cows to the farmers in the alfalfa districts of the southern part of this state, but the facts bear out the statement that, outside of the Imperial Valley, 80 per cent of the alfalfa growers sell their hay, and the milk supply for the city of Los Angeles and other centers in the south is produced to a large extent by dry lot dairymen on restricted areas. Many people contend that this is as it should be, that in this age of specialization it is better that one group of men confine their energies to producing dairy feeds while others produce the finished products. The dairyman argues that it is impossible to raise his own feed on the "high priced" alfalfa land and show a profit on his dairy cows at the same time. These men overlook the fact that they are paying a profit on these lands, only they are paying it to the other fellow.

The alfalfa rancher will tell you that "dairy cows don't pay" and that his money is in selling his hay to the dairyman at the best price he can get. Those who are combining the raising of alfalfa with the production of good dairy cattle and good dairy products advance two outstanding reasons in support of their system.

First: Records show that for the past ten years alfalfa hay fed through cows producing more than 10,000 pounds of milk and 300 pounds of butterfat in one year has returned a greater profit per ton than when sold in the open market.

Second: When a farmer sells his alfalfa hay or other farm crop he is parting with not only the crop sold but with the fertilizer value of that crop and is constantly reducing the productive value of his land. Every ton of alfalfa hay a farmer sells takes from his farm approximately 15 pounds of nitrogen, 5 pounds of phosphoric acid and 10 pounds of potash, with a total value of from $5 to $15.

The farmer who feeds his crops to dairy cows is a manufacturer as well as a producer, with two chances for profits instead of one.

We hear the cry of overproduction of milk these days, but those who have given this matter close study know that the trouble lies in the poor methods of distribution, lack of cooperation among the producers and lack of education of the consumer to use more dairy products.

We of Southern California believe that the future is very bright for the production of pure bred dairy cattle in this section of the state. With the great advantages of a long growing season, excellent feed, combined with wonderful seed stock already on our ranches we believe that before many years Southern California will attract buyers from not only all parts of the United States but from all over the world.

FOR AGRICULTURAL UPLIFT

(Continued from Page 197.)

his own herd. For this purpose we strive to bring together in a general exhibit the best productions obtainable and let them tell their story.

Shasta County Farm Bureau Fair, Anderson, October 6-8

This is the third annual Shasta County Farm Bureau Fair. It is under the management and supervision of and is maintained by the farmers themselves. Our fair started through the club work of the boys and girls of the county, and we hope to keep the idea of friendly competition and not allow it to become commercialized.

The object of the fair is to encourage greater perfection and higher development of agricultural and horticultural products; to raise the standard of livestock breeding, to encourage and educate the people of our county in everything that will raise the standards of their products and increase the comforts and add to the beauties of the home.

The 15 farm centers exhibits will be the outstanding feature of the fair. Each center builds its own booth and exhibits collectively all the farm products of the center. The competition is very great with the other centers. The prizes are given on "most attractive," "most variety," and "quality."

The boys and girls calf and pig clubs will have special exhibits, and the girls canning club will put on an exhibit where 58 girls will take part. There will be demonstrations held on all three days by girls from nine to sixteen years of age.

The last day of the fair, October 8, will be "Pork Day," when each farm center will have ready for auction a carload of hogs. By the cooperation of the farmers Shasta County will offer to the buyers in quantity and quality a fine grade of hogs.

The most remarkable sight is to see the farmers all over the county donating their labor, lending their cooperation to build up a fair that has its educational advantages not available in any other way.

California National Livestock Show, San Francisco, October 22-30.

It is axiomatic that a great agriculture cannot exist without equally great livestock. Livestock cannot attain its maximum growth in agriculture without fitting mediums of expression. The livestock show is the greatest medium of expression for the breeder for at the livestock show the best product of his skill is shown to a discriminating public in its most attractive form.

The California National Livestock Show to be held on Market Street, San Francisco, October 22 to 30, is destined ultimately to be the great breeder show of the Pacific Coast. No other location offers the same advantages that San Francisco does. This show is not intended to be a local circumscribed affair for the greater glorification of a particular locality. Those fostering this enterprise have the broadest possible vision for the future. This show is being built upon constructive lines to ultimately be truly international in scope and character.

The mind does not have to wander far for reasons for holding a great livestock show in San Francisco. It is the logical center for coast livestock, as it is for coast finance. It is the logical center for those that come to our shores from overseas to buy livestock for export. It is also the logical center for domestic buyers.

The directors of the California National Livestock Show are themselves livestock men. They propose having permanent buildings that will eventually house a great show sponsored by breeders for breeders. They propose having an ultimate plant and scope equaled only by the Chicago International.

The mission of this San Francisco show may be epitomized in the single word "service." A great show in the logical center of the coast livestock field, a permanent plant and organization at the command of livestock men.

California Flower and Horticultural Exhibition, Los Angeles, October 20-26

Los Angeles will be the California state nursery and horticultural capital October 20 to 26, this period being set aside for the California Flower and Horticultural Exhibition, which will be held in conjunction with a number of conventions in which nurserymen and horticulturists from all over the state will take part.

The business of these conventions will be naturally of keen interest to those persons engaged in the industry. The exposition itself will be a public display of their work. The scope of the show is so extensive that the visitor to Exposition Park will be amazed at the offering.

For many weeks nurserymen of the state, under the direction of the California Association of Nurserymen, have been engaged in constructing what is to be known as the Sunken Gardens, a seven acre tract that will bloom in profusion during October. It is claimed that it will be the peer of any sunken garden effect in America. Bulbs costing as much as $50 each have been planted, in fact, a fortune lies in the soil of the garden in the shape of bulbs. After the show the sunken gardens will be presented to the city and county of Los Angeles as a gift from the Nurserymen's Association.

Two other departments will go to make up the show, one a cut flower exhibit in the Armory building, the other a big exhibit of plants, nurserymen's supplies, fruits and exhibits of a commercial character. Fred M. Renfro, identified with the National Orange Show at San Bernardino as its general manager for the past seven years, has been selected to design the forthcoming exhibition.

Ventura County Fair, Ventura, October 5-9

Every county fair has a distinct purpose—the exploitation of its resources, an exemplification of its energies to the end that its development may be noted not only by the county itself but by the outside world.

The Ventura County Fair to be held October 5-9, inclusive, has for its distinct purpose the education of its growers, its stock raisers, its producers in every line, the acquainting of the various sections of the county with what each is doing. It may be stated that the Ventura County Fair Association will not hide its light under a bushel, but this year, more than ever, will seek to acquaint the outside world with the advantages that Ventura County has to offer.

The amusement features are not lost sight of, for no fair, it is agreed, can be a financial success unless opportunity is given for recreation and amusement. To this end the best race card in the history of the Ventura fair is to be presented. Chariot races and other spectacular features will be shown each day.

A greater variety of exhibits has

TEAGUE
Quality Trees
Stand Supreme for Growth and Productiveness

If you intend planting citrus or tropical fruit trees specify "TEAGUE TREES" and you will have an orchard that will not only please you in appearance, but will yield profitable crops.

We use the hardiest known root stocks and selected buds from record bearing trees, a combination that insures long-lived and productive orchards.

Our new book on
"Citrus and Tropical Fruit Culture"
is ready for distribution. It describes and gives cultural directions covering all the varieties we handle. Price 50 cents.

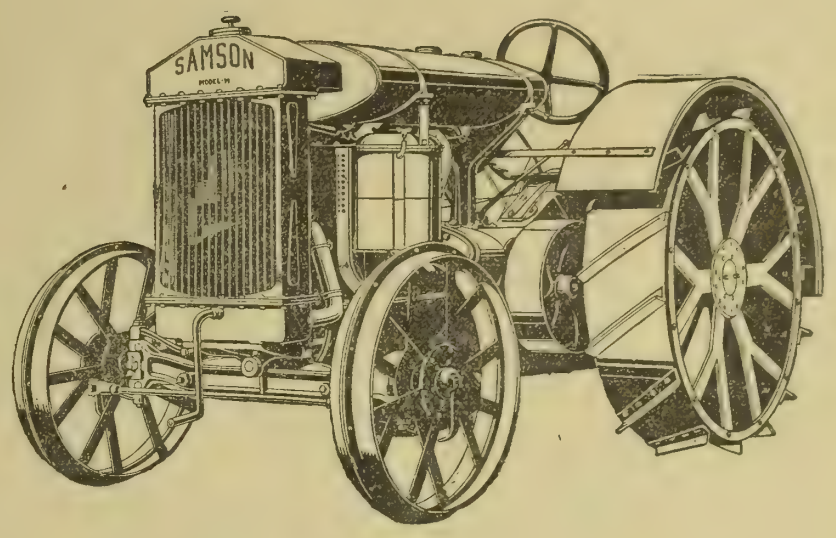
Special Samson Price

Model M Tractor

With special new refinements Platform, Fenders, Power Take Off, Pulley, Magneto, Governor, Roller Bearing, Dust Proof Front Wheels. The Tractor complete.

List Price $1295

Special Samson Price $895

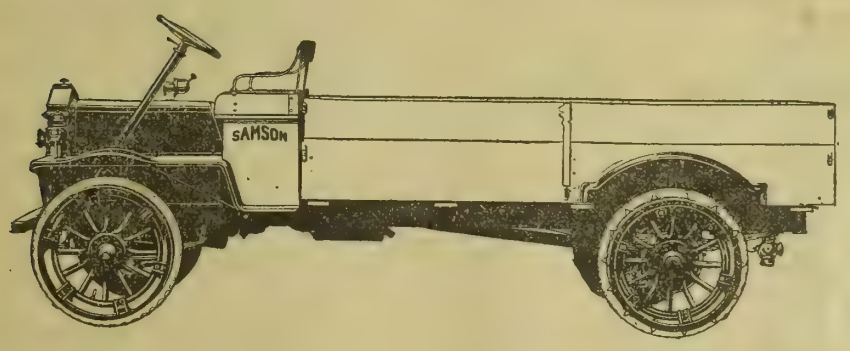


Right now you are confronted with the same kind of problem that your father decided when he discarded the scythe for the mower and reaper. It is the problem of more and better work in less time and at a lower cost—it is the problem of making and saving the crop irrespective of seasonal variations—the problem of realizing a profit even under the most adverse market conditions.

The profits of the future must come through greater efficiency. Lower costs mean greater profits.

Thousands of far-sighted farmers have successfully solved their problems by installing SAMSON equipment.

At the new price, thousands of others will reduce their costs and increase their profits through the use of the efficient SAMSON.



Model 15 Truck

List Price $1021.00

Samson Special Price

$695.80

Model 25 Truck, Complete $1384.50

Avocado Propagation

By Ernest Braunton

THE following notes on propagation and transplanting of avocado trees are condensations of full directions for the work found in the 1921 annual report of the California Avocado Association. Several articles therein on these subjects are written by those generally acknowledged to be the most expert and most experienced in avocado culture, and all who undertake such work would do well to first secure and study a copy of this report.

While any seed may do, the Mexican stock stands both heat and cold best and has the strongest wood of any types grown in California. As the fruits ripen in the fall, from September to December, and should be planted at once, it is necessary to provide winter shelter for seed beds, preferably covers of burlap or other cloth. For soil use half sand and half leaf mold or rich free loam. Plant seeds two inches apart, small end up, and cover a half inch. Scatter pure sand on top to prevent soil baking. Keep constantly moist but not wet.

If well grown, plants will be ready for nursery row, four to eight inches high, in March, April or May. Take up a few plants at a time. Do not let roots get dry, and irrigate as soon as planted. Plant 18 inches apart in row and rows 36 inches apart. Irrigate at least once each week until young trees are well established. Shade each plant from sun by a wide shingle stuck in soil.

In August or September plants should be large enough to bud, or three-eighths to three-fourths inch in diameter. Cut a shield bud about an inch long, with bud in middle of shield. Leave wood in bud. Use T or inverted T cut as preferred. Wrap with waxed tape and unwrap in a month's time. Do not cut entire top off seedling. Leave a few leaves to take up surplus sap and cut entire top when bud is more than six inches long. After bud starts well, tie to seedling, and when latter is cut away, stake and tie at once. Keep off all branches below 24 to 30 inches and allow to form head above this point.

Transplant in early spring, moving as large a ball of soil as can be safely and conveniently handled. Dig holes three feet in all dimensions and put best or top soil in bottom of hole—you can easily improve that left near the surface at any time. Keep a stout stake for the first two years and securely tie tree to same. The third year in the average location the tree will be able to support itself and resist windstorms or it is a poor tree. Young trees should have the trunk shaded until their own foliage qualifies for the same office. Burlap is the material most generally used.

AVOCADO ASSOCIATION REPORT

The 1920-21 annual report of the California Avocado Association is before us, a hundred pages, and several illustrations, of valuable matter so vital to successful growing of avocados that none should plant or grow without a well thumbed copy of it. It contains a full account of the meeting of October, 1920, and May, 1921, also some of the papers and letters not read at these meetings, lists of officers and members, exhibits and exhibitors, etc. It is supplied free to members and to others at one dollar a copy, by G. Agnes McNally, Secretary, Altadena, California.

SMOKE NOT ESSENTIAL IN FROST PROTECTION

It is a curious misconception that many growers have that smoke or smudging is essential in the protection of crops from frosts. Heating for the protection of crops from frosts has been practiced from the earliest days, the famous philosopher, Pliny the Elder, in his book published A. D. 77, Natural History, tells the farmers of his day to "make bonfires in the fields and vineyards of cuttings or heaps of straw, or the weeds that have been rooted up, the smoke will act as a good preservative." Near the end of the seventeenth century in certain sections of Germany it was compulsory that farmers build fires and smudges on frosty nights.

With all previous experience pointing to the use of smoke as a frost preventive, it is not to be wondered at that the first attempts in recent years along this line should consider the smoke essential. Yet elaborate experiments conducted by the weather bureau of the United States government, as well as private individuals and growers in various sections of the country, clearly demonstrate that smoke is not essential, but that heat is the thing to be desired. Smoke is recognized as waste, carbon that has not been consumed in burning, and just as the furnaces of a big factory are adjusted to burn practically without smoke, because engineers have found that that is the economical way to operate them.

CITRUS CANKER QUARANTINE

Additional information as to the citrus canker infestation in the Northern Territory of Australia is being sought by the federal horticultural board, United States department of agriculture, before taking action on the proposal to place a ban on the importation of citrus fruits from Australia, Tasmania and New Zealand to prevent the introduction of the disease into this country. At a recent hearing by the board, D. B. Edwards of New York, official secretary of the Commonwealth of Australia, assured the board that the disease was now under control in the northern territory and that his government was prepared to certify shipments of citrus fruits. He promised to supply further information showing that there was no necessity for the quarantine. With the addition of Australia, Tasmania and New Zealand the quarantine would be complete against India, Siam, Indo-China, China, the Malayan Archipelago, the Philippines, Oceania, Japan, Formosa and the other islands adjacent to Japan, and the Union of South Africa. All citrus fruit from these places are excluded except oranges of the Mandarin class, which are entered under permit.

A widening of the quarantine was proposed as a safeguard for the citrus groves in this country. Although practically no citrus fruit from the northern territory comes to this country, it was thought that the disease might be brought here indirectly in other shipments.

PRICES ON 1921 PRUNES

The first formal prices quoted to the trade by the California Prune and Apricot Growers, Inc., for 1921 crop prunes have just been sent East to the association's brokers by H. G. Coykendall, general manager of the association. Though the prices which have been sent out to the trade are not considered as opening prices by the association the prices just released correspond to the opening quotations which have been named in former years.

The prices quoted to the trade for 1921 crop prunes are Sunsweet Quality 30-40's, 9c bulk basis; 40-50's, 8c bulk basis; 50-60's, 6½c bulk basis; 60-70's, 6c bulk basis; 70-80's, 80-90's and 90-100's, 5½c bulk basis. Prices for Growers Brand prunes are one-quarter cent less per pound on all sizes than Sunsweet quotations. In naming its prices on 1921 crop prunes the association announced that it would not guarantee its quotations against decline and that all prices were subject to change at any time.

Commenting on existing market conditions, H. G. Coykendall said that there was an excellent demand both for domestic and export shipments which gave promise of an early clean-up of holdover stocks of last fall's crop.

Citing as an example the large buying of 1921 crop dried apricots which took place as soon as the pack was available last month, Coykendall said that a similar demand might be expected for new crop prunes as soon as the pack became available for shipment.

In view of the present strong market the general opinion seems to be that any change from the prices named for 1921 crop prunes will be upward instead of downward.

GUMMING BY ARSENIC

A peculiar and apparently serious case of gumming of several young citrus trees in a Glendale, Los Angeles County, city lot caused considerable concern to the owner who scraped and Bordeauxed the gum pockets without results. It was learned that the trees had been painted in spots, by the owner, with ant poison in the effort to control a severe infestation of Argentine ants. This was undoubtedly the cause of the injury which developed shortly after the poison was applied. Other cases have been noted of similar injury to large citrus trees and to avocado trees where ant poison containing arsenic had been allowed to drip from defective cans or paraffined sacks onto the bark of the tree.
